# Highest Award of the Sanitary Institute, Three Silver Medals For "THE CLOSET OF THE CENTURY,"

## WITH SYPHONIC DISCHARGE.

Combines the simplicity of the Cottage Basin and Trap with the advantages of a Valve Closet without the Mechanism.

Depth of Water, 6 inches. Seal in Trap, 3 inches. Surface Area, 12 inches by 10 inches.

In White or Decorated Earthenware, Strong Fireclay or Enamelled Iron, at prices to suit the class of building. No possibility of Syphonage by Discharge of Slops, yet complete removal of contents after use. Special Form of Patented Outlet Joint, securing an absolute permanent air-tight connection to Lead Trap above or below floor level. Special and After-Flush, Quick-Filling and Noiseless Cistern of simple construction.

This Closet has been adopted in Windsor Castle, Buckingham Palace, the residence of the Marquis of Salisbury, the Surveyors' Institute and Institution of Civil Engineers, Westminster Hotel Cecil, Broadmoor and Hanwell Asylums, the various Railway Stations, and public and private Buildings of all kinds.

## JENNINGS' PATENT SYPHONIC DISCHARGE LATRINE For SCHOOLS, FACTORIES, &c.

In cleanliness and freedom from offence—each section being completely isolated and independent—far superior to any system of open and continuous troughs, in which the air (circulating over a largely increased area of impurity) is actually generating the stench it is desired to avoid, too frequently disseminating contagion and disease germs.

In Latrines of the ordinary type the flushing power of the Cistern is spent within the Trough. In the improved System a secondary syphonic action is set up within the range itself, securing the entire removal of the contents and scouring the drain with all the velocity due to the atmospheric pressure upon the water surface.

## JENNINGS' PATENT HOSPITAL SLOP-SINK & BED-PAN FLUSHER.

Architects are invited to inspect these and OTHER SPECIALTIES in action at the Works, where further Particulars and Information can be obtained. Catalogues on Application to

**GEORGE JENNINGS, LIMITED,** BY SPECIAL APPOINTMENT **SANITARY ENGINEERS TO H.M. THE KING**

THE WELL-KNOWN FRIEZE

ENTITLED

“THE CORN FIELD.”

Opinions of the Press.

“We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled ‘The Corn Field.’ The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued.”—THE LADY'S PICTORIAL.

“They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea.”—THE STAGE.

“They are exceedingly artistic, and would grace the walls of any house.”—THE GENTLEWOMAN.

AND NUMEROUS OTHERS.

1. Ploughing.

3. Mowing.

2. Harrowing.

4. Carting.

5. The Products of the Corn Field.

Total length of the Five Plates, Fourteen Feet Seven Inches by Fifteen Inches deep.

A splendid example of COLOUR-WORK in Permanent Ink Photo by M. PAUL ALBERT BAUDOIN.

In consequence of the almost daily demand for these plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing. Free by post, carefully packed inside patent roller.

TRADE NOTES.

HE Isolation Hospital, Maidenhead, is being warmed and ventilated by means of Shorland's patent Manchester stoves, supplied by Messrs. E. H. Shorland and Brother, of Manchester.  
HUTCHESONTOWN Congregational church, Glasgow, now course of erection, is being ventilated by means of Mackay's tent direct-acting ventilators and air inlet panels, supplied Messrs. Cousland & Mackay, ventilating engineers, Glasgow and Manchester.  
At a Newlyn (Penzance) Council meeting held February 4, 1902, several consulting engineers having been considered, Messrs. Merryweather & Sons, of London, were selected to prepare a scheme and plans in connection with the proposed water supply.  
THE Hôtel Cecil extension works are now practically completed and ready for occupation, and in view of the influx of visitors which may be expected in connection with the coronation festivities, it is worthy of note that all the sanitary arrangements and fittings have been carried out by the eminent firm of G. Jennings, Ltd., of Lambeth, in their best manner, a fact which should give confidence to intending visitors as to the sanitary condition of the building.  
MR. G. M. MANSELL, of the Blackfriars Art Metal and Casting Works, Manchester, announces that owing to the rapid increase in his business, which comprises prismatic

pavement lights, staircases, revolving shutters and patent collapsible gates, he has been compelled to largely increase his works, which, in fact, he has now doubled, so that he has every facility for executing orders with the greatest despatch. The following are among the buildings for which he has orders in hand:—Grand Hotel, Llandudno; Grand Hotel, Scarborough; Hôtel St. George, Liverpool; Owen Owens, Liverpool; Post Office Arcade, Liverpool; Walton Schools, Liverpool; Royal Insurance, Liverpool; new shops, Berry Street, Liverpool; Economic Assurance, Manchester; Manchester and Liverpool District Bank (five branches); Union Bank (five branches); Manchester and County Bank; Manchester Race Course.

BUILDING AND BUILDERS.

THE Local Government Board have sanctioned a loan of 1,600l for the purposes of Sandsend (Whitby) sewerage scheme.  
TENDERS have just been invited by the Corporation of West Bromwich for laying down, &c., twelve miles of tramways. The cost, including buildings, is estimated at 128,500l.  
A NEW mission-hall and Sunday school which have been erected in connection with St. Cuthbert's, Everton, Liverpool, at a cost of about 2,600l., was opened on the 6th inst.  
THE extensive scheme of water supply for Barnsley is rapidly approaching completion; 170,000l. has already been expended, but it is estimated that it will cost another 130,000l. to complete the work.  
IT is intended to build a new police-station for Bedale, Yorks. A site has been selected nearly opposite the Greyhound inn at Askew, where the standing joint committee propose to erect a house for the resident inspector with police-station attached. This improvement has been long needed.  
SOME large works are about to be put in hand by the Corporation of Ripon. Additional waterworks are to be built at a cost of 30,000l. Street improvements are to be made at a cost of 3,500l. Public abattoirs are to be erected at a cost of 1,500l., and several other works are contemplated.  
THE plans received in the recent architectural competition for a set of baths at the junction of Broad Lane and Calverley Lane, Bramley, have been on view during this week in the Central Court at the City Art Gallery. The premiums were awarded to competitors as follows:—(1) Mr J. Lane Fox, East

Parade; (2) Mr. William Bakewell, Park Square; and (3) Messrs. Dixon & Hill, Park Lane.

IN our account published on the 31st ult. of the opening of the Bermondsey Electricity Works, we described the destructor as consisting of six cells and capable of destroying 50 tons of refuse in 24 hours. We are asked by Messrs. Hughes & Stirling, the builders of the destructor in question, which is known as the "Stirling" Refuse Destructor, to make the following correction, *i.e.* that "each cell is capable of easily destroying 15 tons of refuse per day of 24 hours, making a total of 90 tons per day," a request with which we gladly comply.

IN response to the invitation to arbitrate between the masters and men in the building trade dispute at Maidstone, the Board of Trade has written to Mr. M. L. Crow, secretary to the Master Builders' Association, and to Mr. W. H. Oram, secretary to the Allied Trades, intimating that it has appointed Mr. G. R. Askwith, barrister-at-law, of 2 Pump Court, E.C., to act as arbitrator. The secretaries are now in communication with him as to the date and place of the meeting; it is expected that the arbitration will be held in Maidstone.

THE managers of St. Ann's Roman Catholic schools—which are to be pulled down along with the cathedral in pursuance of the street improvement scheme which the Leeds Corporation are carrying out at the junction of Park Row and Cookridge Street—have secured a convenient site for the new schools. These will be erected in Woodhouse Square, where some 2,000 yards of land have been purchased at a cost of 1,800*l.* Building will be commenced shortly, and it is calculated that several thousands of pounds will be spent on the schools. The architect who has designed the new cathedral, Mr. Eastwood, of Cheniston Gardens, London, has also drawn the plans for the schools.

THE directors of the North-Eastern Railway Company have invited tenders for the erection of twenty-four houses for their servants in a field near the Bellendean Road, in close proximity to Tweedmouth station. The houses will be built in two rows—one of thirteen houses and the other of eleven. They will each contain five apartments—a kitchen, front room downstairs, with three bedrooms upstairs. All the houses will be provided with a pantry, wash-houses, gas and water. They will be constructed of brick, and will have a pleasant view overlooking Spittal and the mouth of the Tweed. Applications have already been received from the servants of the company for the occupation of the houses. A large signal cabin

has just been erected at Tweedmouth station for the working of the points, and a new turn-table is being made.

ACCORDING to the latest trimestrial report just issued by the Amalgamated Society of Carpenters and Joiners, the income of the society during the three months dealt with was 1,071*l.* 9*s.* 3*d.*, which, added to the previous balance, gives a total of 1,532*l.* 12*s.* 6*d.* The total disbursements were 499*l.* 16*s.* 1*d.*, and the balance at the end of the year was 1,032*l.* 16*s.* 4*d.* In his remarks Mr. F. Chandler, general secretary, says wages questions continue to cause trouble in different districts, in spite of the resolution of the National Federation of Building Trade Employers, which recommends the removal of restrictions on labour, the limitation of apprentices and interference with business management as subjects of more pressing importance than reductions of wages. Reports from Scottish branches referring to the end of January nearly all state that trade was dull.

AT the last meeting of the Birkenhead School Board, plans of Mr. Thomas W. Cubbon, architect, of Birkenhead, were adopted for an important block of educational buildings, including a pupil teachers' college and two higher elementary schools for 300 boys and 300 girls respectively. The teachers' college has accommodation for about 150 students, consists of the usual science and other classrooms, also an examination hall, library, dining-room, &c. The higher elementary schools are planned according to the regulations of the new Minute of the Board of Education, and include, in addition to ordinary classrooms, central chemical and physical laboratory, drawing classroom, gymnasium. The boys' school also includes manual-room, the girls' school cookery and laundry accommodation. The site is in a commanding central position adjoining the General Post Office, and has cost 6,000*l.* The whole block of buildings is expected to cost about 30,000*l.*

### ELECTRIC NOTES.

THE directors of the Electric-Lighting Boards (E.L.B.) Manufacturing Company, in answer to the numerous communications they have received, ask us to announce that inquiries, correspondence, &c. should be addressed to the head office, No. 7 Pall Mall, S.W., and directed to the company rather than to individuals.

Specially and scientifically designed to prevent and mitigate the evils of Smoky Chimneys.

**THE KONKOR CO.**

94 SKINNER LANE, LEEDS.

### MAY-OATWAY FIRE ALARM.

Since the recent practical test of this system at Ilford, bookings have been very heavy.

Dingle Station, the scene of the late fatal fire, is now protected by the May-Oatway System and connected direct with the Liverpool Fire Brigade.

The Manchester-with-Chorlton Guardians have contracted with the MAY-OATWAY FIRE APPLIANCES, LTD., to protect their Workhouse from fire.

No person need risk life or property by fire. The MAY-OATWAY automatic bedroom indicator will show on retiring that the house is safe, and wake you immediately and indicate its position when a fire breaks out.

Gilbert Wood & Co. Ltd., 6-11 Imperial Buildings, Ludgate Circus.

Members of the Dublin lighting committee appointed coming year paid a visit of inspection on Monday to the new electric-lighting works at the Pigeon House. Members of the committee present were:—The Right Hon. Lord Mayor, the chairman (Councillor Irwin, J.P.), Mr. Lord Dodd (deputy chairman), Alderman O'Reilly, Mr. Lord Dowd, Councillor Booker, Councillor Begg and Mr. Lord Leahy. They were accompanied by Sir Thomas Martineau, J.P., Mr. John Clancy, T.C., Mr. Robert Hammond (building engineer), Mr. W. Stewart, building contractor, Mr. Spencer Harty (city engineer), Mr. Henry Campbell (clerk), Mr. E. W. Eyre (city treasurer), Mr. Ruddle (chief electrical engineer), Mr. Collard, Mr. Lewis and Mr. Ellicott (Mr. Hammond's assistants in office), Mr. D. O'Sullivan and Mr. F. J. Allan (secretary). On the full inspection of the building works, the progress of which the committee expressed satisfaction at, Councillor Irwin, on behalf of the lighting committee, called upon the Lord Mayor to lay the corner-stone of the engine-house. The Lord Mayor performed the ceremony and expressed the hope that the electric-lighting scheme would turn out the great success which all the citizens wished it. The members of the committee and the other visitors were subsequently entertained at a formal luncheon by the chairman.

### VARIETIES.

Mr. H. GARBUTT, town clerk of Marylebone, has resigned his appointment owing to failing health.

Mr. J. B. COLWILL, surveyor, 6 Alma Road, St. Albans, announces that he has taken into partnership his son, Mr. J. Gould Colwill, and that they will continue to practice as quantity surveyors at the above address under the style of Colwill & Son.

It is announced that the accident department of the Lancashire and Yorkshire Fire Insurance Company, which has been the absorption of the Equitable, been worked from the company's branch office in Manchester, is now transferred to the head office of the company at 45 Dale Street, Liverpool.

The Lambeth Borough Council have opened negotiations with a view to securing a site for a new town hall and municipal offices which, in their opinion, will be more worthy of the

borough's new-born dignity than the present structure in Kennington Road.

THE Local Government Board refuse to allow the well sunk by the parish of Bardney, Notts, to be used for a public supply. The Welton Rural District Council have consequently resolved to submit the scheme as first recommended by their engineer, Mr. J. R. Elliott, of Nottingham, for their approval. A loan of 3,000*l.* is to be applied for.

A NEW Volunteer drill hall at Twickenham was opened recently. The building, which is a substantial brick structure capable of seating six or seven hundred persons, was built partly by a grant given from the Middlesex County Council fund for the development of the Volunteer forces of the county and partly by local subscriptions.

A NEW edition of the excellent "Map of Metropolitan Railways, Tramways and Municipal Improvements," published by Mr. Edward Stanford, Long Acre, is now ready. It comprises a description of all the schemes for improvements of various kinds, the plans for which were deposited in November 1901 for consideration in the present session, and shows as well schemes which are already passed. The new boroughs are indicated in distinctive colours, which will be found very useful, and the price of the map is 6*s.*

AT Sheffield on Wednesday the design of Mr. Alfred Turner, of Stratford Studios, Kensington, for a memorial of the late Queen Victoria opposite the Sheffield town hall, was accepted by a committee, acting on the advice of the late Mr. Onslow Ford and Mr. E. W. Mountford. The memorial will cost upwards of 3,000*l.* The figure of the Queen will be in bronze on a stone pedestal. The prizes offered to competitors were won by Mr. Oliver Wheatley, of Chelsea (100*l.*), Mr. Horace Mountford, Clapham (50*l.*) and Mr. F. Lynn Jenkins, Chelsea (25*l.*).

THE first annual dinner of the Aberdeen Association of Civil Engineers was held at the Imperial Hotel, Aberdeen, on Saturday, when there was a large attendance. The chair was occupied by the president, Mr. P. M. Barnett, engineer-in-chief, Great North of Scotland Railway. After the loyal and patriotic toasts, Mr. Charles Stewart, M.A., headmaster, Robert Gordon's College, gave the toast of the evening, "The Aberdeen Association of Civil Engineers." In the formation of the Society, he said, they had been animated with the spirit of the times, and its objects were mainly educational, and their special care was that the young engineer's education might

be kept on sound lines throughout the critical period of his life, the period on which would depend his future usefulness. Mr. J. Barron, vice-president, M.Inst.C.E., replied. He regretted that Aberdeen did not supply the education which was necessary to those entering the profession of civil engineering in respect that there was no chair of engineering in the University. However, they hoped that before the new university buildings were completed this defect would be rectified. Mr Charles Hawksley, president of the Institution of Civil Engineers, London, proposed the memory of Thomas Telford. In doing so, he referred to the great works of Telford under the conditions in which he laboured. Before sitting down Mr. Hawksley encouraged the Aberdeen Society to further and continued success, and spoke of the many excellent engineers that were Aberdonians. Other toasts followed.

### ELECTRIC FIRE ALARMS ON RAILWAYS.

IN order to prevent a recurrence of the disastrous fire which took place just before Christmas in the Dingle tunnel of the Liverpool Overhead Railway Co. the directors of that company have had the May-Oatway electric fire-alarm system installed, and for the purpose of testing this a large number of fire brigade and insurance representatives, together with commercial men, on Saturday proceeded from Pierhead to Dingle station by a special train provided by the company. The Overhead Company is the first railway concern that has adopted this system, and hence it was that those in any way connected with fire insurance or extinguishing evinced a keen interest in the result of the tests. To make these of an entirely independent character the following committee, which includes several fire insurance companies' representatives, was appointed:—Messrs. G. Bowler, Paul Lange, J. R. Grant, C.C., J. W. Marsden, E. J. Hiddin (National Telephone Company), J. W. Cowper (Westinghouse Company), R. Harrison, K. G. Walton, Perkin (Messrs. Lever Bros.), Halladay (Messrs. Rylands) and R. R. Bevis (Messrs. Laird Bros.), together with Superintendents Thomas (Liverpool fire brigade), Smith (Birkenhead) and Roberts (Bootle). There were also present Messrs. S. B. Cottrell (general manager of the Overhead Railway Company), R. C. F. Arnett (honorary secretary Liverpool Engineering Society), G. H. Oatway, &c.

The committee having examined the appliances, the whole company assembled in the Park Road booking-hall to witness

the result of the experiments. The detectors of the system were placed at various points in the tunnel, in the signal-box, the station buildings, and in case of an outbreak of fire one of these points an alarm will be automatically given only to the employés if they be on duty, but also to the fire brigade at Hatton Garden. Furthermore, on arrival at railway station the brigade will discover by means of a cator where the fire is situated, and the amount of time required to reach it. The experiments consisted of oil-saturated asbestos in one of the signal-boxes, 40 seconds set the alarm gong going; and, secondly, a similar "outbreak" in the booking hall, which again set the detector and sounded the alarm in about a minute. The system gave every satisfaction to the committee and members of the company present, and, on the proposal of Mr. Paul Lange, a cordial vote of thanks was passed. Interesting demonstrations and the kind hospitality of Mr. Cottrell and Mr. Oatway responded, and subsequently the visitors returned to Pierhead by the special train.

We understand that in consequence of the successful nature of the experiments, Messrs. Bell Brothers & Co., the well-known ship-store dealers, &c., have arranged to install their extensive premises in Redcross Street shall be fitted with a similar appliance.

### SOLIHULL NEW INFIRMARY.

THE workhouse accommodation at Solihull has been increased by the completion of the new buildings which have been lately opened. These consist of an infirmary and wards which have been built to the designs of Mr. W. G. G. architect, of Birmingham, by Messrs. W. & S. Thompson, Solihull.

The infirmary block provides accommodation for a hundred patients. The ground floor consists of two large wards, adjoining which are two separation wards with two bathrooms, lavatory and sanitary accommodation is provided on most approved modern principles. At either end of the block small special wards are provided for use in special cases requiring isolation. These wards have independent accommodation. On the first floor are two large wards, separate wards, similarly fitted up to those on the ground floor. The administration block is in the central part of the infirmary and is so arranged as to reduce labour and cost of administration.

a minimum. Connected with the infirmary building is a ward for the use of convalescents, and the maternity ward which is exceptionally well appointed. The wards are all fitted with the most modern appliances. Provision is made on the separate cell system for eight male patients, and there is immediate communication with the infirmary cells. There are also associated wards for thirty-two patients, these being subdivided and classified. On the first floor is separate cell accommodation for the female patients. The tramp master and mistress have commodious quarters, with clothes-drying and receiving-rooms and other conveniences. The work is executed in red brick, with stone dressings and brick strings, &c., the roofs being covered with tiles. The ward floors are laid with polished oak, the corridors, lobbies, lavatories and bath-rooms are covered with encaustic tiling. The wards are heated by means of gas-burnt double-fire stoves, and a steam boiler supplies all the water for radiators in the corridors, linen-rooms, &c., as well as for hot and cold-water supplies. The buildings have been erected in strict accordance with the requirements of the Local Government Board, and the cost per bed is about £100.

## ELECTRIC PASSENGER ELEVATORS.

Meeting of the Institution of Junior Engineers held at the Westminster Palace Hotel on February 7, the chairman, Mr. Marshall, presiding, a paper—"The Electric Passenger Elevator"—was read by Mr. William J. Cooper. The principal requirements of an effective electric elevator are safety, reliability, effective control, economy of space, and were divided into two clearly defined classes, having reference to (1) the winding machine in operation, while the elevator was in use with the safety devices, which were usually inactive, but had to come into play as soon as a portion of the hoisting apparatus failed or got out of order; (2) the car with its safety gear moving up and down the shaft. The chief features of an ordinary gear were the armature of the motor coupled to a worm with ball or collar bearings to take the thrust of the worm; a worm wheel submerged in an oil bath and fixed in a suitable bracket, entirely protected from dust or grit; a grooved winding drum or vee-drum fixed to the worm wheel or mounted on the same shaft.

Such machines were almost exclusively operated on the overbalance system. This had the advantage of economy of power by making the system balanced when the average load was in the car, in which case the elevator had no gravity work to perform, and resulted in the most economical type of hoisting apparatus.

The electric motor and winding machinery could be erected either at the top or at the bottom of the hoistway as desired. If fixed at the top, one face of the drum could be plumb over the centre of the car and the other face plumb over the counterbalance weight. Under special circumstances the machinery might be placed at a distance from the hoistway and the ropes guided over diverting sheaves, but it was obvious, however, that the fewer sheaves employed the less would be the wear on the ropes and loss by friction. The arrangement of placing the machinery at the top of the hoistway was particularly adapted to the electric elevator, as the current was easily conveyed by the cables to the motor and controller.

The author dwelt on the importance of an effective form of brake. It might be mechanically operated from the switch-gear shaft by the controlling rope, or be an automatic magnetic solenoid brake, the type now generally adopted. A solenoid and magnet of small dimensions could be made to give a pull of 500 to 600 lbs. through one-half inch.

To meet the severe demands of the elevator, motors of a somewhat distinct class had been introduced, constructed so as to need little attention. A comparatively small motor could be used, as in all cases the maximum load was of short duration, the motor standing idle for at least half the time. Shunt motors were self-regulating if the potential was constant, and were now almost invariably adopted, but with about 10 per cent. of series winding added on the field magnets to enable the motor to develop a powerful torque at the moment of starting.

Considerable ingenuity had been expended over the starting and controlling switches, the operation of which might be effected in various ways, either by a hand rope, a hand wheel, a lever, or by a push-button device. The controller had to perform three general functions:—

1. Make and break the current for motor, and reverse the armature circuits.
2. Cut out the starting resistance automatically, and with fixed steps.
3. Cut in the resistance for stopping and applying the brake.

The push-button controller was to be recommended for

private houses, or places where an attendant was not required, the elevator being operated by the passenger. The machine was of the ordinary drum type, the controlling being entirely electric, and operated by simply pushing a button.

Various automatic safety devices were used in connection with the working controller or push-button switches. These devices were operated by both the car and the hoisting machine, to cut off the power and apply the brakes at the limits of the car's travel.

The safety apparatus and the bottom guide shoes were attached to the bottom of the car, which was surrounded by the girdle irons or a steel channel crown bar of special section for lightness, securely connected to the under frame by side bolts fitted with adjustable guides of gun-metal or cast-iron and movable guide sheaves for the hoisting ropes to pass over to the bottom of the car to prevent undue wear.

To guard against the car falling unretarded to the bottom of the hoistway in the event of the hoisting ropes breaking or becoming unshipped there were several types of safety gears employed, attached to the bottom or platform of the car, and arranged to operate by gripping the fixed guide posts or backings, either by the action of the compressed springs or levers, or by the combination of springs and centrifugal governor.

Reference was made to accidents arising from the insecurity of entrances to the hoistway.

An electrical locking apparatus should be fitted to all electric elevators, by which all the hoistway doors or gates would remain locked except when the car itself was in position at the landing and stationary. The opening of any door was arranged to break the main circuit of the motor, and it was impossible for the motor to be started again until the gate was shut and locked and the circuit remade.

It was shown that electric elevators of the type described were safe, reliable, easily controlled and noiseless, while economy was claimed in cost of maintenance and power used. In most towns and cities the cost of electrical energy for power purposes was between 2d and 4d. per B. O. T. unit. The first cost in many cases compared very favourably with that of hydraulic or other elevators. The electric elevator was adapted to standardisation. The whole of the hoisting gear could be kept in stock, and ready for assembling when an order was received, and the voltage, speed of travel and load known. The length of the travel did not enter into consideration so far as the driving-gear was concerned, the motor having

simply to run somewhat longer, and the increased travel was thereby attained.

In conclusion, the author pointed out that the current used in an electric elevator was in direct proportion to the number of persons or load carried, while with one, hydraulically it was necessary to fill the cylinder with water whether the load was light or heavy.

A discussion followed the reading of the paper, and of thanks having been passed to the author, the proceedings closed with the announcement of the ensuing meeting on February 22 to the new baths and washhouses at Fulham, the next meeting on March 7, when a paper on "The Engineering Models" would be read by Mr. Percival Marshall.

### DUBLIN MASTER BUILDERS.

THE annual dinner of the Master Builders' Association took place on Saturday evening in the Antient Concert Hall, Dublin. Mr. James Beckett, president, M.B.A., occupied the chair. There were present the Right Hon. the Lord Mayor, the President of the College of Surgeons, Mr. R. Bolton, Mr. Serjeant Dodd, Messrs. Wm. Mitchell, Maurice Dockrell, J.P.; John Good, hon. sec., Alderman Cotton, J.P.; the city architect; J. P. Murray, R.H.A.; Sir Thomas Drew, president, R.F.C. chairman of the Pembroke Urban Council (Mr. J. Perry), Sir Thomas Pile, Bart.; Messrs. Wm. Field, W. Kaye Parry, M.A., B.E.; James Martin, A. Todd, Louis Byrne, M.D.; Sir Charles Cameron, C.B.; the Sheriff, Mr. Thomas Connolly.

After dinner the President said it was now twelve years since there passed over them a great sorrow by the death of Her late gracious Majesty, Queen Victoria, who left to them a noble life as an example to him who should follow in her footsteps. Amid the general gloom of that time they met under happier auspices, and he asked them to join in a toast to the health of their gracious King Edward VII.

The company rose, and with great enthusiasm they sang the "God Save the King" which was splendidly sung by Mr. T. Cowle, J. Mayston, W. Scott and J. Kelly, and with the course of the evening sang some choice quartettes.

## THE HELLIWELL "PERFECTION SYSTEM" PATENT GLAZING

WORKS: BRIGHOUSE, YORK  
LONDON OFFICE: 11 VICTORIA STREET, W.

Thomas Connolly said he had been asked to propose a toast which he was sure would be warmly received by all. It was the toast of "The Right Hon. the Lord Mayor." In no company of Dublin citizens was it necessary to say the many good qualities in the character of the Lord Mayor who had filled with great credit to himself, and with advantage to the citizens of Dublin, the high office to which he had been elected. During his occupancy of the civic chair, he had made hosts of friends. His colleagues in the office, who were the best judges of the impartial manner in which he discharged the duties of his office, re-elected him Lord Mayor, in responding, said he was aware how much the Lord Mayor had been, and rightly, associated with the interests of the city, and should naturally feel deeply interested in an Association such as theirs, on which the future of the city so much depended. He had only to complain that the Lord Mayor had turned what was really an official toast into a personal compliment to himself (the Lord Mayor). He could only accept it as a compliment to himself in so far as he had endeavoured to live up to the high traditions of the office to which he had been elected. The position of a Lord Mayor was not always an easy one, but from his experience during his past year of office, he could say that he had met persons of every class and condition in the city, and he believed they were all ready to treat him as the occupant of the civic chair, if they found him worthy of it. They might differ on political and religious questions, but he believed the higher they went in the social scale, the more they found the highest and deepest respect was accorded for the high office which he held. He shared the feelings of many of his colleagues when he said it was deeply felt by them that citizens possessed of more property and position did not take a deeper interest in the civic affairs, for they could largely afford to devote more time to manufactures and other interests of the city. Men of leisure could better afford the time to study the importance to the well-being and growth of the city, and should be ready to devote more of their time to the public interest. Differences of political opinion existed between them, and there was a deep cleavage on some of the great questions, but there was no reason why Irishmen should not unite those differences. He could not see why they should not credit for sincere convictions to those opposed to them, and work side by side on many questions where they could be united and attached to a nation of great wealth and

great resources, but unhappily for them they only came in for a small proportion.

A Voice: "Question."

The Lord Mayor said he was not going to raise any political question, or give offence to anyone present. The progress of their city should depend largely on that loyal co-operation for the common good, and putting aside certain issues they were all proud of their common country and common nation. In conclusion the Lord Mayor said he hoped that when the time should come when he would have to retire from his office he should do so without having given offence to those who differed from him.

Mr. John Good proposed "Trade and Commerce," a toast which he was sure all creeds and all classes of Irishmen would honour. The building industry was a large factor in connection with trade and commerce. It gave employment in the city to upwards of 12,000 hands, but in common with most other industries it felt that wave of competition which now seemed to be so rampant, and for which they should be prepared if they desired to withstand it. Capital should be vigilant and attentive, but unless it was backed by the efforts of labour it would be without avail. Labour in the present day should be improved in quality. They should have a higher standard of education for their mechanics so that they might be equal to those of other cities. He would couple with the toast the names of Sir Thomas Pile, of the President of the Pembroke Town Council, and of Mr. Maurice Dockrell.

Sir Thomas Pile, in responding, spoke of the connection between the Master Builders Association and the trade and commerce of Dublin. They were all, he said, proud of the buildings of the city, which were mostly designed by Irishmen and carried out by Irish hands. Within the last few years great progress had been made in the city, and he was glad to observe the friendly relations which at present existed between capital and labour in the city. He believed there was a great future before the city, and he was glad to think that technical education would enable their working men to compete with labour on the other side of the Channel. The Port and Docks Board were at present promoting a Bill in Parliament which possessed one of the greatest features of their time, and if it passed Dublin would soon take rank as one of the finest ports in the United Kingdom. He looked forward to the time when the main drainage and the electric lighting of the city would be completed, when Dublin would be worthy of themselves and a great emporium of trade and commerce.

Mr. Perry, in responding, defined what was trade and what was commerce, and speaking of the work done by the master builders, he said they carried out the conceptions of great architects, and the result was that in every street noble premises were erected which were worthy of the city. With regard to commerce, an enormous number of steamers traded to the port of Dublin, and within the last fifteen years great store-houses had been built, traffic was increased in their streets, and everywhere there were signs of progress and improvement.

Mr. Maurice Dockrell, J.P., in responding, said he could not pretend to be bowed down with the weight of years, yet he remembered the time when year after year in the Mansion House in this city it was customary to attempt to entertain a body of quiet and respectable citizens with statistics supplied by the Registrar-General of Ireland, with the result that many of the guests fell asleep, while those who did not suffered next day from a bad attack of congestion of the liver. The industry with which the Master Builders' Association was connected was in a flourishing condition compared with that of the metropolis in the North of Ireland and of cities across the water. As to trade and commerce, the toast opened up a subject which they dare not attempt to handle at a gathering like that, but he should say that a great deal depended on the facilities which were given for the trade and commerce of a city. He was proud to have the opportunity of saying that the Lord Mayor was largely responsible, and in a high personal degree, for the success of the Bill which was now being brought into Parliament for the improvement of the port of Dublin, and for affording the facilities required for the advancement of trade and commerce. Most of those present remembered the small craft which visited the city a comparatively few years ago, and they saw what progress had since been made along their quays. Large vessels now arrived in the port, but they should not delude themselves and live in a fool's paradise by being content with what had been done. He was one of those who, having been educated at two of the best public schools in Ireland, considered that that education had been absolutely wasted on him. A great deal of time in public schools was lost in the study of Greek verbs and on other subjects which had nothing to say to the industries of the country. The Government had established an Agricultural Department, but that was only the beginning of what should be done. He had unbounded faith in the capacity of Irishmen. Anything that any white man could do could be done by an Irishman. He had not lost

faith in his country. They should stand shoulder to shoulder and work for the trade and commerce of the city and old Ireland which all loved so well.

The company marked their appreciation of Mr. I. speech which he delivered in dashing style by singing with great spirit, "For He's a Right Good Fellow."

Mr. Wm. Mitchell, R.H.A., proposed "The Builders' Association," and coupled with the toast the President.

The toast was received with applause.

The President, in responding, paid a high tribute to the energy and capacity of the late Alderman Macgibbon, who gave so much of his time to the interests of the city. He also mentioned the late Alderman Toole and Mr. The Master Builders' Association came into existence to a strike. They had at that time—some five or six years ago—the good fortune to receive help from the Roman Catholic Archbishop of Dublin in settling the dispute which existed between themselves and their workmen, and since that time, no quarrels, no questions between the members of the Association and the workmen in their employment. That was a happy state of affairs, and they did not experience any trouble in settling their disputes. He believed this largely due to the excellent temper and spirit of the members of the city towards them that the work of the trade was carried on without friction. He was sorry to call it a trade, but it was an art, and an art it was still regarded in other countries. The President then complained of what he considered a shocking system of competition when every pound of nails or pound of putty had to be taken into account in contract pay. He hoped that in the near future the contracts would be of an equitable character as between man and man.

Mr. R. Denne Bolton proposed "Our Guests," and with the toast the names of Sir Thomas Drew, the President of the College of Surgeons and of Serjeant Dodd.

Sir Thomas Drew said that for the last forty-three years he had been associated with the builders of Dublin, who were his friends. After the many years he had spent in Dublin he did not want to leave it for any place else, for they were one family, and he was happy amongst them.

The President of the College of Surgeons said that Mr. Dockrell complained that he had been imperfectly educated, though he had been at two public schools, and might

THE CHANCERY LANE SAFE DEPOSIT AND OFFICES COMPANY, LIMITED.

Visitors are invited to inspect the Safe Deposit, which is open free from 9 a.m. to 6 p.m. Descriptive Prospectus and full particulars obtained from E. Vincent Evans, Manager and Secretary, 63-64 Chancery Lane, London, W.C.

on Myles) say that his education began and nearly in a national school, and that he was therefore afraid he was in a position of hopeless inferiority? The President then said that he came to Dublin in 1873, and he remarked on the improvements which had been made in the city since that time.

Mr. Serjeant Dodd, in responding, congratulated the company on the arrangements which had been made in connection with the exhibition, observing that they had the toast of "The King," and that they had been responding to it with becoming loyalty and enthusiasm.

They were entertained with good music and they heard good speeches. Referring to Mr. Dockrell's speech, Mr. Serjeant Dodd thought Mr. Dockrell was speaking against a liberal education, but Mr. Dockrell, in his own speech and in his person, had afforded an argument against the theory that a liberal education was propounding, for if public schools could produce such a result, Mr. Dockrell, then great credit was due to public education.

The education which he had received enabled him to do his fellows in public life, and had made him a competent speaker, as he was that night. But after hearing the speech of the College of Surgeons saying that he had never attended a public school in his life, he (Serjeant Dodd) almost came to the conclusion that public schools were a fraud. In the end, Mr. Serjeant Dodd said it was a liberal education to which he was referring in his speeches of the President and of the other gentlemen who had spoken that night.

### ELECTRICITY IN MANCHESTER.

Mr. H. LAW, Local Government Board Inspector, held a meeting recently at the Manchester Town Hall into an inquiry made by the Corporation for permission to borrow money for extensions connected with the electricity undertaking. Mr. T. Hudson, deputy town clerk, took charge of the proceedings for the Corporation, and amongst those present were Mr. Alderman Box, Dr. Bishop (chairman of the electricity committee), Mr. W. H. Hesketh (deputy chairman), and Mr. Beastow, Bowes, Cowan, Howarth, Jennison and others, members of the City Council.

Mr. Hudson described the electric undertaking of the Corporation. Under various Acts of Parliament Manchester supplied electric current for lighting and other purposes and electricity for the working of tramways in the city and in the districts. The Corporation was responsible for sup-

plying current to Levenshulme, Heaton Norris, Withington, Moss Side, Droylsden, Audenshaw and Denton, and for working electric tramways in Failsworth, Droylsden, Audenshaw, Gorton, Denton, Levenshulme, Heaton Norris, Stockport, Middleton, Stretford, Withington and Moss Side. When the tramways system was completed the length of lines would be something like 150 miles. Taking the present application in sections, Mr. Hudson said the first part of it was concerned with the completion of a scheme laid before Mr. Boulnois at a similar inquiry held in 1901. That was the scheme of Dr. Kennedy for the construction of plant to give 15,000 horse-power at Stuart Street, and the amount now required was 82,000*h.p.* At the inquiry held by Mr. Boulnois five only of the ten sub-stations were dealt with. The present inquiry was concerned with the remaining five stations and with additional matters. The second part of the inquiry was to deal with a proposed new installation at Stuart Street, which had been designed by Mr. Metzger. This would provide an additional 12,000 horse-power and cost 350,000*l.* The third part of the inquiry related to the Dickinson Street low-tension station, where it was proposed to replace four small belt-driven sets by two new turbo-generator sets. The new sets would provide 6,000 horse-power as against 1,600 horse-power provided by the four old ones. The estimated cost of these new sets was 43,861*l.* Existing machinery had cost 13,861*l.*, and the Corporation proposed to deduct that and borrow the balance, viz. 30,000*l.* The remaining item to be submitted was a sum of 15,000*l.* for additional mains to be carried between Ashton Old Road and the Corporation transforming station at Denton. To show the necessity for the proposed additional outlay, Mr. Hudson submitted figures relating to the whole equipment of the undertaking. The existing plant at Dickinson Street provided 12,000 horse-power, and the plant at Bloom Street, when completed, would provide 14,000 horse-power. Dr. Kennedy's installation at Stuart Street would provide 15,000 horse-power, and Mr. Metzger's installation at the same station, which was the subject matter of that inquiry, would provide an additional 12,000 horse-power, making a gross total of 53,000 horse-power actually in operation, already sanctioned or about to be sanctioned. This power was appropriated as follows:—The existing private consumers, down to Christmas 1901, represented 15,000 horse-power, allowing a slight margin for reserve; the additional present demand for lighting, also allowing a margin, represented 7,000 horse-power; the additional demand for traction within half a mile of

Uniformly Bound in Cloth, Price 12s. 6d.

Office: Imperial Buildings, Ludgate Circus, London, E.C.

Bloom Street represented 3,500 horse-power; the current from Dr. Kennedy's ten sub-stations, chiefly for tramways, absorbed 7,500 horse-power; four additional tram routes not provided for in the first figures, 2,500 horse-power; additional requirements for lighting and power, including the General Post Office, 5,000 horse-power; and ten additional sub-stations connected with Mr. Metzger's scheme and reserves and increased demand, absorbing 12,000 horse-power. These figures showed, Mr. Hudson said, the necessity for the outlay, and the Corporation were unanimously in favour of the application.

Dr. Bishop, as chairman of the electricity committee, gave evidence as to the growth of the demands upon the department. The progress of the undertaking had been more rapid than the committee could cope with, so much so that during a considerable portion of the last twelve months the committee had had to ask that applications for power should be deferred.

Mr. Hudson: I think on one occasion you were threatened with legal proceedings for not supplying current?

Dr. Bishop: Yes, and the committee had some difficulty in obviating those proceedings. Dr. Bishop gave figures showing the growth in the number of consumers. There were 1,981 in 1898 and 3,980 to-day. The names of 170 applicants who were waiting for connections were on the books. To meet the present and the prospective demand the committee considered these extensions absolutely imperative.

Mr. W. H. Hesketh, Dr. Kennedy, Mr. Metzger, Mr. Allott, the engineer, and Mr. T. de Courcy Meade, city surveyor, gave additional details of the various schemes, and the inspector afterwards visited the Corporation power station and other works under the control of the electricity committee.

#### BRIGHTON MASTER BUILDERS' ASSOCIATION.

THE annual dinner of the Brighton Master Builders' Association was held on the 4th inst. under the presidency of Alderman W. Botting. Mr. A. V. Treacher proposed, "Continued Success to the Association of Master Builders," and congratulated the members upon the excellent choice of a chairman they had made in Alderman Botting. The principal object of the Association was the promotion and protection of the interests of the building trade of Brighton and the district by having, among other things, unity of action in the settlement of all questions arising between employers and their

workmen. No strikes of any importance had arisen since the constitution of the Association ten years ago. That was a matter for congratulation, and, so far as he knew, the relations between employer and employed were exceedingly friendly. He thought that an Association of this class had the effect of promoting increasingly friendly relations between master and man. As to life assurance, he pointed out that the Association had an offspring, the Employers' Liability Insurance Company, the object of which was to insure a builder against accidents to his workmen. It had been very successful during the three or four years it had been in existence, because, after paying respectable dividends and all expenses, the company had saved nearly 50 per cent.

The Chairman, in acknowledging the compliment, pointed out the fact that the formation of the Association was the result of a very severe strike in Brighton, which placed the building trade of Brighton in a great fix ten years ago. Then, in 1900, the belief that they were in the right, the master builders put the trade on foot down, and now they were reaping the benefit. They had gone through ten years without any interruption worth mentioning, and to-day they had neither rules in their workshops nor did they allow the men to demand what they should receive for their wages. They were paying as much as any other town in the country to the town, more than in many cases, and therefore they were just to their men. In other parts of the country the master builders had gone so much in favour of the workmen that the National Association of Master Builders had just passed a resolution deciding to abolish rules in all workshops throughout the building trade, so that the master should be really the employer and the only consideration in engaging workmen should be a fixed wage for certain work. In most towns there were no strikes, but in Brighton they would not suffer in the slightest thanks to the stand they took ten years ago. He believed it would be for the benefit of the building trade generally, and also for the workmen, that workshop rules should be done away with, because through them it had become almost impossible for master builders to carry on under existing conditions. The Association had been very successful, and Brighton master builders were in a much better position than the majority throughout the country. Lately legislation had gone much in their favour, boycotting and picketing being illegal. The insurance company started four years ago in connection with their Association had been so successful that after paying 5 per cent. they had 5,520% to meet any demand that might be made upon them for compensation.

# ARMOURD FIRE DOORS

Telephone,  
No. 143 Westminster.

Telegrams,  
"Sprinkler, London"

Officially Endorsed by the Fire Offices Committee.

Lighter and Cheaper than Iron Doors.

# The Architect.

## THE WEEK.

FOR a long time past manufacturers in the neighbourhood of railways have complained of the absence of facilities on the part of the railway companies by declining to allow sidings to be constructed, or by issuing regulations which are an obstacle to business. The creation of the Railway Commissioners was mainly owing to protests of this kind. The Commissioners have, however, to accept the law as it is found in private Acts, and consequently the grievances of manufacturers in many parts of the country have not been much diminished. A case was heard in the Court of Appeal on Monday, in which the parties were the Lancashire Brick and Terra-cotta Company and the Lancashire and Yorkshire Railway Company. In 1894 the plaintiffs took land near Baxenden station to start works on a large scale. An agreement was entered into with the railway company for the laying-down of sidings, which were to be used only for the company's traffic unless with the consent of the railway officials. The Brick and Terra-cotta Company afterwards let a part of their land to a manufacturer of chemicals, who also by authority used the sidings. The railway company, although expressing willingness to aid the additional traffic, gave notice to determine the agreement. Application was accordingly made to the Railway Commissioners by the Brick and Terra-cotta Company, who decided in their favour. The railway company, however, appealed. The Court of Appeal considered that the railway company could not be forced to allow a connection to be made between their line and a siding. This was owing to the form under which the Railway Companies Act, 1845, had been drawn. The notice was therefore legal. The judgment is remarkable, for if allowed to remain it will have the effect of increasing the obstinacy of railway companies. It is true that sidings promote traffic, but they cause some trouble to officials, and in consequence of the dislike of the latter the internal commerce of the country is impeded to an extent that outsiders are unable to imagine.

MR. G. R. ASKWITH, barrister, as arbitrator appointed by the Board of Trade to arrange the differences between builders and their workmen at Maidstone, has presented his award. The following is the principal part:—Having ascertained that the matters in dispute were hours to be worked in the winter months and the overtime rule in rules proposed by the Maidstone Building Trades' Association, Mr. ASKWITH announces that rule 2 shall read, "From first Saturday in December work to terminate at 4.30 P.M.; dinner, half hour, except in case of shops, when one hour may be allowed for dinner, in which case work will terminate at 5 P.M.," and rule 3 shall read, "All overtime made at the request of the employers to be paid at the rate of time and a quarter. Overtime shall not be reckoned until each full day has been made, except where time is lost by stress of weather. On Saturday overtime shall commence at noon. Christmas Day, Good Friday, Sundays and all bank holidays shall be paid for at the rate of time and a quarter. Bricklayers employed in gauged and fire work, except domestic work and foundations to boilers or ovens, to be paid 1s. per hour extra. Men employed for well work, involving work below ground-level or superintendence at well mouth, to be paid 1s. per hour extra." The award is to be accepted as final and binding. Work has been resumed. The hearing of the evidence occupied no more than a couple of hours, and the prompt settlement is therefore a satisfactory testimony to the efficiency of the power entrusted to the Board of Trade and its temporary representatives.

A CORRESPONDENT writes:—"My client wants to pull down his present ancient shop and rebuild at the corner of a narrow street in the busy part of a town, which the authorities desire to widen if he does pull down. Can they refuse to pass my plans if he does not consent to set back? Or, can they compel him to set back and sell them what

land they would like?" Local authorities have now powers to propose and raise money if necessary for street improvements. The value of any land taken from private owners will be paid, the amount being determined either by private arrangement or by arbitration. Where an improvement is contemplated by the local authority it would hardly be fair to pass plans which would never be carried out unless the improvement was postponed. The authority cannot decline to pass plans without giving some reason, and a sufficient time is generally allowed for deliberations before arriving at a decision on the subject. In the majority of such cases it is wiser to show a desire to aid in facilitating the improvement, for opposition does not enhance the value of the property.

THE church of St. Bride, which stood on the site of the existing building near Fleet Street, was among those which succumbed to the Great Fire in 1666. The font, which bears the inscription, "Deo et Ecclesie ex dono Henrici Hothersall, A.D. 1615," is the only relic that has survived. There is also a stone which belonged to a vault which bears the date 1657. The main body of the new church was built by WREN in 1681, and the steeple was added in 1699. The latter was originally 8 feet higher than it is now, but when after the steeple suffered by lightning in 1764 the spire had to be taken down, it was judged advisable to reduce the height. For some time past there has been apprehension about the safety of the spire. The ironwork which was employed to strengthen the different stages has corroded the stonework. It will therefore be necessary to take down the spire and to rebuild it in its present form. By many it is thought to be WREN'S most successful attempt to produce a steeple in the Italian style. St. Bride's, with St. James's, Westminster, and St. Andrew's, Holborn, are reported to be the three churches best adapted for preaching in London.

CANON ROUTLEDGE once more appeals for funds to continue the explorations in St. Augustine's Abbey Field, Canterbury. The expenditure has amounted to nearly 700l., but at least 1,000l. more is needed. In return for the outlay the plan of the Saxon chapel of St. Pancras has been revealed. A considerable part of the crypt of the abbey church of St. Peter and St. Paul has been excavated to a depth of 11 feet. The diggers have revealed the eastern apse with a surrounding ambulatory, out of which open a central and two flanking apsidal chapels, rich in painting and architectural features, each with its own altar; also eight massive pillars, arranged in a semicircle to the west of the ambulatory, and two small stone columns, which with others may have formed the supports of the high altar above. If funds are obtained, it is proposed to complete the excavations of the crypt westward and to explore the chapter-house.

THE new volume of *L'Art*, which is edited by M. PAUL LEROI, starts under favourable conditions. An etching by M. LALAUZE after FREUDEBERG is in four colours, and recalls similar work of the eighteenth century. "La Portes des Jardies," by the late DANIEL MORDANT, represents an old gate and wall in Ville d'Avry, but it is admirably adapted as an example for tyros in etching; it is at once simple and effective, every stroke showing the master's hand. For many the three plates of reproductions of Greek and Roman coins from the collection of Count FRANZ VON WOTCH will be still more interesting, as from the care taken in the process the heads and symbols stand out in sculptural power. They are therefore infinitely superior to the diagrams which are commonly employed in books on numismatics. It is remarkable that in modern times designs equally valuable are not obtainable. M. AD. JULIEN writes about GOSSEC, who was one of the eighteenth-century composers of music in France, and whose works are now almost entirely forgotten. A curious inventory is given of the property of BARTHELEMY, who was one of the imitators of PALISSY'S work. It is dated 1615, and was drawn up by a notary. M. PAUL LEROI continues his articles on recent examples of art industry, and gives several illustrations of electric lamps of a remarkable character.

## THE VIBRATION REPORT.

IN one sense, "the report of the committee appointed by the Board of Trade to inquire into the vibration produced by the working of the traffic on the Central London Railway" can be considered satisfactory. When the vibration was first felt there was naturally alarm. So much has been written about the weaknesses of London houses, it is almost impossible to resist the misgiving that there is some truth in the allegations of unsoundness. All at once an extraordinary test was applied, and a great many timid people assumed that the noise and the vibration were forerunners of the crack of doom. The ordinary journalists anticipated a series of catastrophes, and prepared the way for them by all the artifices of their rhetoric. But after a great many months' experience not one of the houses between Shepherd's Bush and the Bank has succumbed, and not one case of serious damage to a building has been brought before the law courts. We doubt if in any other city in Europe so reassuring a result could be recorded under similar circumstances.

The actual, as distinguished from the imaginative, effects of the railway are shown by the report of the committee appointed by the President of the Board of Trade. They were to investigate to what extent the working of the traffic on the Central London Railway produces vibration in the adjacent buildings. There was no narrowing of the scope of their operations; the subject could be dealt with in any manner they pleased. That vibration which is sufficient to cause serious annoyance is felt in many of the houses, the members of the committee ascertained by personal observation. But they do not refer to a single instance where injury was done to the walls or other parts of a house. This is a remarkable testimony to the stability of the houses along a line running from the east to the west of the Metropolis, and some of which would be classed as of inferior character. We hope it will have the effect of converting those who make a pretext of declaring that London is a huge province of jerry-built structures, that the materials as well as the workmanship are dangerous to the inmates, with many other erroneous conclusions.

We believe, moreover, that no manner of building could prevent the vibration from being felt. There is no material sufficiently sound-proof or elastic to withstand the effect of the force represented by the trains. Witnesses who live along the route declare that early in the morning they suffer most when the workmen's trains pass, also between 5 and 8 P.M. when people return from business, and when the last night trains are running. This statement may be considered to be one of the prejudices due to the imagination, which have their origin whenever there is a grievance. At certain times the weight of the trains is no doubt increased by the crowded state of the carriages. But on those occasions the stoppages at the stations do not appear to give any extraordinary shock to the passengers; whether in the trains or on the platforms. During the early morning and at night the sound arising from the traffic may be more audible, and it is erroneously concluded that greater vibration must also be endured. The scientific evidence which the committee obtained did not justify the belief in a connection between excessive vibration and the morning, late afternoon or night trains. It was, however, demonstrated that the disturbances caused by successive trains are very unequal. Special observations were taken during a whole day by a band of competent witnesses. The phenomena which they recorded, when reduced to order for the benefit of the committee, showed (a) that it was a matter of chance whether a given train caused a slight or a severe vibration; (b) that trains causing a severe vibration in one house were as likely as not to cause only slight vibration in the others; (c) that different rooms in the same house were not similarly affected by the same train. These seemingly contradictory results may one day be reconciled and explained, but at present they baffle other judges beside the committee. It is possible the differences in the character of the buildings, owing to their manner of construction, slight variations in the subsoil, the presence of sewers and other conduits, may all be factors in preventing uniformity in the degree of vibration, and, if so, it would be an endless task to deal with such data.

The committee under the circumstances could not wait

to explain the particular instances, and at once sought a cause of vibration in general in the character of the way and its engines. In May 1901 a joint Parliamentary Committee on Underground Railways came to the conclusions that vibration arose chiefly from—(1) The proportion of the weight of the locomotives not borne by springs, and (2) want of rigidity in the rail. Now engines on the Central London Railway carry on each an excessively large load unrelieved by springs. The spring-borne load carried on each of the four axles of a locomotive is 8 tons, making 32 tons in all. This construction was adopted in order to obviate the necessity of gearing, and the committee could not but connect this difficulty with the magnitude of this unsprung-borne load. The railway company, who are anxious to carry out whatever will diminish the inconvenience, ordered two types of locomotives to be constructed in which the unsprung-borne load would be reduced; but they had to be manufactured and some delay was caused. On trial of the new engines the committee considered that a great improvement had been attained by the diminution of the parts which were unsprung-borne. The vibrations decreased sometimes to the extent of one-third. They therefore recommended the adoption of a type of locomotive or motor in which the load not carried on springs is reduced as far as possible. This may be arrived at, it is said, by using gearing as in geared locomotive or motor carriages, or by using a geared locomotive in which an elastic connection is employed between the driving axle and the motor.

The next subject which came up for consideration was the rail. On ordinary railways the old bridge-rail has generally superseded, but that section is employed on the Central London Railway. The committee wished to know the effect of a heavier and stiffer rail. But economy was so despotic throughout the construction it was found impossible to employ a slightly deeper rail without encroaching too much on the narrow margin between the tunnels and the tops of the carriages. The air pressure in front of the trains is believed to be increased by the limitation of the open area in the tube, but the enlargement, however slightly, would no doubt amount to a big saving. The rails are carried on longitudinal sleepers, but it is not thought the arrangement affects the vibration. It is remarkable, however, that the principal source of disturbance is ascribed to the unevenness of the surface of the rails. It is usually supposed that the top of a rail is almost a perfect plane. But the committee say that rails as they leave the rolls are usually curved, and the process of straightening by local bending beyond the limits, however skilfully carried out, inevitably leaves certain waviness. As the unsprung-borne part of the rail follows the rail over the crests and hollows of the way, it is subject to vertical accelerations which cause the pressure on the support to become variable. When there are no springs and the speed is high, a state of things is reached in which the pressure on the rail momentarily disappears and the load is on the point of jumping out of the hollows. Such part of the load as is carried by the springs moves nearly in a horizontal line without following the waviness of the rails, and the pressure on the support corresponding to it remains nearly uniform, and accordingly innocuous. When very high speeds are contemplated it may become a question whether a higher standard of straightness should not be aimed at. It appears that the irregular impulses given by uneven rail surfaces have the effect of establishing and maintaining an oscillation of the rails and road-bed, the whole being regarded as an elastic support loaded with those masses which are carried by springs.

It is hardly possible to obtain more level rails than those which are usually employed, and the committee do not propose any change in rolling. They consider a deeper rail would be an advantage, but there is not sufficient room to allow of its being introduced. In new railways of the same class they advise that room should be allowed for the introduction of a deeper rail. The final conclusion of the committee is that, without altering the permanent way of the Central London Railway, the change of motors which they have recommended will effect a practically complete cure of the disturbances or vibration. If that desirable

achieved, the committee will deserve the thanks of many shareholders, occupiers and other people who have a stake in property. It will be observed that throughout the report a word is said to suggest that the inconvenience was in at least degree caused or increased by the manner of the construction of the houses. There is no doubt the daily passage of trains is a severe test of their stability, but as houses have withstood it so long, we may be assured they remain secure in the future.

### NEW CONDITIONS OF CONTRACT.\*

"Woe to the State where lawyers flourish" was the exclamation of JOHN SELDEN, and no one was better entitled to give a judgment on the subject than the author of the "Dissertation on Fleta." It may be said with no less truth, "Woe to the fine art of which the followers have to possess a knowledge of law, and to act not only as lawyers but as judges." In the old days the architect's business was to design and superintend the carrying out of a building, and it is possible he made the design in parts as the works progressed. He rarely was obliged to trouble himself with litigation, for his supremacy and infallibility were acknowledged by all the men he directed. The few cases in which architects were made to suffer for breaches of laws or regulations are sufficient to give their general immunity. Modern investigators do not believe in the legend of the death of APOLLODORUS in the order of HADRIAN, and if it occurred it was not for an offence against Roman law, but rather from the jealousy of the Emperor. The imprisonment of SANSOVINO on account of the fall of the roof of the library in Venice is the most serious of the recorded cases in which architects suffered. In Venice, however, offences against the State were judged in an arbitrary manner. SANSOVINO'S punishment was quickly recognised as excessive, for he was liberated and the money paid for his fine was returned to him.

We need not, however, trouble ourselves with ancient foreign practice. In this country until recent times buildings were erected without giving opportunities for lawyers. The cases mentioned in law books are modern, and do not extend beyond the nineteenth century. FARNSWORTH BARRARD is one of the oldest, and it was decided in 1877. The reasons for the change which can be ascribed are manifold, and we suppose it would be as easy to transform Great Britain into Arcadia as to bring back the days when contracts with builders were brief, simple and stereotyped in form—we might also add, and rarely referred to. There was confidence all round. The builder was acquainted with the architect, and was prepared to make a sacrifice rather than have a dispute with so high an authority. The architect knew the weak points of foremen as well as of employers, and was able to provide against them without difficulty. The building owner looked on the architect as a friend and trusted him as if he were a family lawyer. With so happy a condition for working in, the wonder is that the buildings were not all as harmonious as the relations between the parties concerned in them.

To-day an architect's main concern in the majority of cases is to safeguard his client and himself against any appearance in the law courts. He must begin to be wary from the time the drawings are prepared. Metropolitan borough regulations have to be steered through with caution. He has to look ahead for the possible light-and-sound cases which may be looming in the distance, although at the outset there is no indication of their existence. He may know little of the contractor to whom he has to trust the execution of the works, and in any case he must be anxious about various financial questions until the works are completed and the accounts settled. With all a host of troubles does the one word "bankruptcy" menace an architect. Mr. MACEY, in his new "Conditions of Contract relating to Building Works," tells us how "An

architect does not guarantee to the employer that the contractor is solvent, or that he is capable of performing the contract. But it is the duty of the architect to inquire into these matters, and to inform the employer if he knows or hears of anything detrimental to the contractor and to advise the employer accordingly." The case relied on about the duty referred to a house agent's responsibility, but it might be held to apply also to an architect. How can a man give his attention to details when he is disquieted by apprehensions of an impending failure on the part of the contractor, and knows the difficulty of preventing the works from being completed under the sanction of the Courts in a careless but cheap manner? An architect may have from the first to consider bankruptcy as inevitable, and to prepare for that event in the contract deed. Here is a passage that would amaze the old school of English architects:—

The Bankruptcy Acts, 1883 and 1890, do not give the trustee in bankruptcy the right to elect to proceed with contracts that are "personal." An ordinary contract for ordinary building work has been held not to be a "personal contract" (*Marshall v. Broadhurst*, 1831), but whether a contract for building work can be made "personal" by agreement it is somewhat difficult to say, as, although the contract may stipulate that it is to be considered a "personal contract," yet the Court may hold that such a clause would be bad law within the strict meaning of the term "personal contract."

To paint a picture or to sing at a concert are both "personal contracts." To build a lighthouse has been held to be a "personal contract" (cited in the case of *Wentworth v. Cock*, 1839). Therefore it seems that a contract may be considered to be "personal" when the person selected to perform it is chosen on account of some special attribute on his part or on account of some skill peculiar to himself alone, and of which another person is not equally or similarly possessed. Hence, if a contract can be so worded as to show that the contractor's personal qualifications are relied on, the Court may hold the contract to be a "personal contract" within the legal meaning of the term. Then in that case a clause determining the contract on bankruptcy would certainly seem to be good law against the trustee in bankruptcy.

Here is another suggestion. Omit the bankruptcy clause altogether from the contract, and make the contract a "personal contract" by a special stipulation to that effect. There would then in such case be no evidence by the contract that the employer was endeavouring to oust the trustee in bankruptcy from his rights. And if the Court held that the contract under these circumstances was "personal," then the trustee would not have the right to elect to proceed with the work. The contractor would, however, have the right to do so, if he could get financed.

To these straits an architect is driven in order to avoid the trusteeship system of completing contracts. It suggests that he cannot expect to have that equanimity when creating or adapting which is considered indispensable for painters and sculptors. His power of design must suffer when he is anticipating legal difficulties to arise, and which a client is assured an architect can avoid. HOGARTH'S "Enraged Musician" was a happy man if compared with the architect who has to deal with an unfortunate contractor in difficulties, and consequently attended by a flock of harpies.

There is much else besides the contractor's financial resources which must engage the architect's attention. He must be prepared to meet in one way or another fires, claims of easements, advertisements on hoardings, analysts, bad weather, combinations of workmen, workmen's compensation, insurances, liens, obstructions, &c. The Vitruvian requirements or the more ample encyclopædic knowledge which Dr. ISAAC WATTS considers essential for young logicians are insignificant in comparison with the technical lore which is expected to be possessed by every architect whose practice is general. It must be remembered also that on the accuracy of the architect's knowledge large sums of money will be involved, and that what in other affairs might be considered as no more than a trivial inaccuracy may cause serious losses. This weight of responsibility has to be accepted, but the effort to sustain the onerous realities is not conducive to the development of the imaginative or artistic faculties.

It is not surprising that under the pressure of finance and other agencies there should be a desire for greater stringency in the conditions of contract in order to secure

\* *Conditions of Contract Relating to Building Works.* By Frank Macey, architect. Revised as to the strictly legal matter by B. Leveson, barrister-at-law. (London: Sweet & Maxwell, Ltd., and B. T. Batsford.)

a satisfactory conclusion of the works. Mr. MACEY'S model is precise throughout, and gives definitions and clauses which are not always considered necessary. For instance, it is said about the word "best," which is often used with laxity:—"The word 'best,' as applied to materials, articles and workmanship, shall mean that in the opinion of the architect there is no superior quality of materials or finish of article in the market, and that there is no better class of workmanship obtainable." Another clause makes it a necessity for a contractor to study the conditions so that a plea of ignorance cannot be afterwards set up. He is also expected to "visit the site and make himself thoroughly acquainted with its nature and with the requirements of the works." It is distinctly announced that "the bill of quantities shall not form the 'basis of the contract,' but shall be used solely as the schedule of prices of work, labour and materials upon which the contractor based his tender," until after the contract is signed.

VANBRUGH, in one of his comedies, makes a character say, "Look you, sir; some folks we mistrust because we don't know them—others we mistrust because we do know them—and for one of these reasons I desire there may be a bargain beforehand." In a similar spirit modern contracts have to be arranged. The bargain must provide for every possibility of failure, and allow no loophole for the escape of any of the parties. It may seem odd that such a subject as vaccination should have a place in a contract for building. But there may be occasions when the operation is necessary, and Mr. MACEY'S clause provides for it, as well as the provision that if the contractor refuses or fails the contract can be determined and the employer can recover any loss or damage sustained through such determination. There was a time when the wages paid by a contractor was not considered a subject with which the building owner or his architect was concerned. A dispute over wages can, however, retard the progress of works, and the contractor in Mr. MACEY'S conditions has to agree to pay "not less than the minimum standard rate of wages as recognised for the respective trades and branches of the trades in the locality in which the work is being done." If the clauses appear too rigorous the architect can of course modify them, but it is better in the end for a contractor to understand his exact position than to imagine he can evade or misinterpret difficulties because the language of the specification and conditions fails in undisguised exactitude.

The order of the conditions for carrying out works is a natural one. Hoarding and fencing, shoring, delivery of plant and materials, arrangements for workmen, watchmen, examinations, tests, deviations, payments, &c., are treated in succession. In Mr. MACEY'S "Specifications in Detail" each item is described at so much length as to make the volume a treatise on building materials and appliances as well as construction. The clauses in the "Conditions of Contract" are treated in a similar manner, and the pages become a manual of the law of building. One work is the complement of the other, and both form a complete guide to modern architectural practice.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. W. Emerson, president, in the chair.

The Hon. Secretary announced the decease of the following members:—The late Marquis of Dufferin, elected honorary fellow 1866; the late Mr. James Stevens, elected fellow 1877; and the late Mr. E. W. Barnes, of Bristol, elected fellow 1882.

Mr. F. W. BEDFORD read a paper, illustrated by lantern views, descriptive of the life and works of

#### Baldassare Peruzzi.

The son of a weaver of Volterra who had settled in Siena, Peruzzi, the architect-painter, was born in 1481. As a youth he delighted in frequenting the workshops of the goldsmiths and others who practised the art of design. At the age of twenty he was appointed assistant to Pinturicchio, who was engaged in painting the chapel of San Giovanni. He shortly after went to Volterra and painted a chapel near the Florentine gate, and then was persuaded to go to Rome.

Here, entering the workshop of the father of Maturino, he greatly impressed his master and other artists by his power of

design and painting. Agostino Chigi, a rich Siensese banker, befriended and supported him while he devoted himself to study of the architectural antiquities of ancient Rome. During his stay in Rome, from about 1503 to 1522, he painted and designed a great many buildings. He then spent some time in Bologna, whither he had gone by invitation of the wardens of St. Petronio, that he might take part in the competition for the completion of that church. From Bologna he was almost compelled to return to Siena to prepare designs for the fortifications of the city. After completing this work he returned to Rome, and became engaged on St. Peter's. In the sack of Rome in 1527 he was made prisoner, was maltreated and shamefully tormented, lost all he possessed. He was ransomed by the republic of Siena, and was appointed to superintend the fortification of that city. In 1529 he was sent by the Pope to help the Papal and Siensese armies in subduing the city. After the war returned to Rome and became engaged in the erection of various palaces and on St. Peter's. He found time, too, to study astrology and mathematics, and became so expert in the art of perspective drawing as to surpass all other masters of the day. He commenced also a book on the antiquities of Rome, with a commentary on Vitruvius, and prepared many drawings for the illustrations. Many writers speak in eloquent terms of Peruzzi's nobility and modesty of mind, which, however, were imposed upon by his patrons, so that in his old age he was very poor. As he lay on his death-bed, to which he had been brought not without a suspicion of poison, Pope Paul III. sent him 100 scudi and many promises. He died on January 1537, and was buried in the Pantheon by the side of Raphael.

Mr. Bedford then treated of Peruzzi's architectural work, some still to be seen in Italy, others spoken of by various authors but no longer existing, and others which have been attributed to him. Among the former mentioned were the Palazzo Massimi, admired by Peruzzi's contemporaries, since held to be among the masterpieces of the Renaissance. The beauty of the plan and the refinement of the details have never been surpassed. The cortile of the Palazzo Massimi is one of the most charming in Rome. A still more famous work is the Villa Farnesina, a work which Baron von Geymüller attributes to Raphael. The paper dealt with the subject at some length, and suggested weakness in the regard adduced by Baron von Geymüller in favour of Raphael as architect. The piercing of the frieze with windows, as at the Villa Farnesina, was a favourite motif with Peruzzi, and is to be seen in many others of his buildings in Siena and at Bologna. The monotony Monaldini complains of in the architectural details of the Farnesina no doubt resulted from the exquisite taste Peruzzi always displayed when he wished to combine painting with architecture, when he was careful that the structural work should not interfere with the more delicate lines of his painting. A number of other buildings undoubtedly Peruzzi's, generally attributed to him, and Peruzzi's share in the various designs and plans made for St. Peter's were referred to. Vasari states that Pope Leo X., desiring to bring the building, which had been commenced by Julius XI after the designs of Bramante, to a conclusion, and finding the edifice too large, resolved to have a new model constructed, "wherein he committed the work to Peruzzi, who prepared a model, which is truly ingenious and of a magnificent character." Vasari on this point is confirmed by Serlio, who publishes Peruzzi's model. Vasari also states that the facade of the principal chapel, which had been commenced by Bramante, was completed by Peruzzi, who constructed it in peperino marble. Peruzzi was appointed architect to St. Peter's on August 1, 1520—less than five months after the death of Raphael—and held the post until May 6, 1527, and from 1527 to 1531, and again from May 1535 to January 6, 1537, the day of his death. The author expressed his disagreement with the view of Baron von Geymüller, who states that the plan published by Serlio is really Bramante's, that the plan or model mentioned by Vasari was only a combination of Bramante's nave with the choir of Rossellino, and that most of the drawings in the book which have been attributed to Peruzzi, one or two of which are signed with his name, were made by Peruzzi for Bramante, while he was the latter's draughtsman. That Peruzzi was Bramante's assistant is not recorded by Vasari—who mentions both, and who published his book of "Lives" in 1550, thirteen years after Peruzzi's death—or by Serlio, who was Peruzzi's pupil. That Peruzzi was greatly influenced by Bramante, and was a sincere admirer of his work, on which he founded his own style, is undoubted; but there is no reason to suppose that the many plans and perspective sketches by him were made for Bramante, and were not the expression of his own ideas.

In Siena, Peruzzi's chief work was the rebuilding and strengthening of many parts of the city walls; he built towers or gateways, four of which—the Porta Laterina, the Porta Pisipini, the Porta St. Prospero and the Porta Capuana—still remain. His most interesting work in Siena is

Palazzo Pollini, or Celsi—one of the most refined and dignified of the palaces in Italy. The Palazzo Turchi, outside the Porta S. Maria, was built about the same time as the fortifications of the Palazzo Pollini, for in the cornice, which is of terracotta, Peruzzi has not only used the same enrichments, but has employed the same moulds for the casting. The details of the frieze, architrave and cornice are almost Greek in their ornament. A number of other buildings by Peruzzi, or attributed to him, were referred to. Many of his designs for the church of St. Domenico in Siena are preserved in the *Uffizi*. Leaving Siena, the description went on to buildings designed by Peruzzi at Carpi, Ferrara, Vallepiatta, Viterbo, Capranica and Caprarola. Vasari says that "Peruzzi prepared the design and model for the cathedral of Carpi. . . . The structure was built under Peruzzi's direction, and according to the rules laid down by Vitruvius." Baron von Geymüller does not dispute Peruzzi's authorship, but remarks that the design is based on the elements of Bramante's design for St. Peter's. Bedford considered, however, that from the style of the building, from the fact that Peruzzi was in Rome when Alberto Bruni, for whom the Duomo was built, wrote to his agent that he was sending the model from Rome, and that several writers named Peruzzi as the architect some few years later, the weight of evidence is in Peruzzi's favour.

The paper concluded with some remarks on Peruzzi as a painter. His paintings were classed with the best of his day. Most of them were executed as fixed decorations, and very few of his easel pictures exist. The influence of Pinturicchio, doubtless his first master, is seen in all Peruzzi's paintings. After he owed much to Sodoma and to Raphael. Some of the paintings on the ceiling of the loggia in the Farnesina are in imitation of stucco-work in relief. Vasari says that he consulted the Cavalier Tizian, a most excellent and renowned painter, to see them, and he could by no means be persuaded that they were painted, and remained in astonishment when, changing his point of view, he perceived that they were paintings. Some of his most celebrated paintings are those in the Villa della Pace. They were done in 1515 or 1516, and are strongly influenced by Sodoma and Raphael. The paintings in the Villa Belcaro, which belong to Peruzzi's later years, are among his best, and show great decorative power. They are dated 1535, and are the last he did in Siena. Neither Vasari nor any other ancient writer speak of Peruzzi's designs for tapestry, but in the collection of Prince Sigmaringen there is a sketch of the Adoration of the Magi, which was attributed to Raphael, but which is really by Peruzzi. The tapestry is now in the Vatican.

Peruzzi is said to have been the most elegant painter among architects, and the most ingenious architect among painters. He was unfortunate in that he happened to live at the same time as the three greatest geniuses of the Renaissance—Bramante, Raphael and Michel Angelo—whose influence permeated the whole of the artistic world, and made it impossible for any other artist to achieve anything free from the charge that he owed the idea to one or the other. But although he learnt much from them, he still preserved more of his originality than his other contemporaries, and infused a spirit of refinement into his work which has never been surpassed. That modern architecture owes to Peruzzi, and what architects owe to him, it is impossible to estimate; but no architect, excepting perhaps Brunelleschi and Bramante, did more in the development of the application of Roman architecture to modern times.

Sir HENRY HOWORTH proposed a vote of thanks to the author of the paper. He said the history of architecture was too much an impersonal one; the lives of the architects themselves were seldom touched upon. It would be well, therefore, for a new departure to be made and a more personal history of the men given, with their works. It was curious that Rome itself had little influence on the arts of Italy. Rome was a waste between the close of the ninth century and the beginning of the thirteenth. The return of the Popes to Rome restored its prestige. Money was spent lavishly, and attracted thither the great men of genius.

Professor BERESFORD PITE seconded the vote.

### THE LATE JOHN NORTHWOOD.

MR. JOHN NORTHWOOD, whose name is celebrated in the annals of the glass trade as the modern discoverer of the long lost art of the cameo decoration of glass, died at The Cedars, Wall Heath, on Thursday, the 13th inst., at the age of sixty-three years. His reproduction of the Portland Vase, says the *Birmingham Post*, was a unique event in the glass trade, and excited the utmost interest among connoisseurs generally when it was announced, proving as it did that the cameo vases of the glass makers of classical days could at least again be made. Of the few cameo works in glass which have come down to the moderns, the Portland

Vase is the most famous. It is a cinerary vase, and is supposed to have contained the ashes of a member of the imperial family of Alexander Severus. It was found in a marble sarcophagus, near Rome, in the early part of the seventeenth century, and for a time rested in the Barberini Palace at Rome. It came at last into the possession of the Portlands—hence its modern name of the Portland Vase—who in 1810 placed it in the British Museum. Here, in 1845, it was smashed by a lunatic, but it was so skilfully put together again that it is still "a thing of beauty and a joy for ever." The vase represents, or is supposed to represent, Thetis consenting to be the bride of Peleus in the presence of Poseidon and Eros, and the two former are also represented on the reverse side. What is so remarkable about the vase is the way in which the artist has worked out the subject in the brittle material of glass. The ground of the Portland Vase is dark blue glass, and the figures upon it are cut out in cameo style from an outer layer of opaque glass. This now presents no insuperable difficulty to the skilled glass decorator trained in this class of work, but when Mr. John Northwood set to work, he had to start *ab initio*, and even to make the tools which he used in puzzling out the secret of the ancient workers in glass. He spent three years over the task, and during the progress of the work a flaw showed itself in the vase, which developed till the vase split in two, but, like the pieced original, it was successfully joined together, and what occurred was no detriment to the happy conclusion of Mr. Northwood's labour. At the end of the eighteenth century Josiah Wedgwood made fifty copies in fine earthenware of the Portland Vase, and we understand that it was one of these that Mr. Northwood had as a model. It was on the day that he started to London to compare his own work with the original in the British Museum that the flaw showed itself of which we have spoken. The vase which Mr. Northwood produced is now in the possession of Mr. P. Pargiter, of Stourbridge, and its value runs into four figures. Mr. Northwood began his career in the glass trade at Wordsley in the works of the late Mr. Benjamin Richardson, a noted manufacturer, and was engaged in the etching and enamelling departments. Afterwards, in conjunction with his brother, he started etching in a workshop in Wordsley, and it was whilst here that he tried his hand at cameo work, and developed it to the remarkable extent he did. Besides the replica of the Portland Vase, he made the handsome vase presented to the Birmingham Art Gallery by Sir Benjamin Stone, and other important works. For the last twenty years or more he has been the principal manager at the glass works of Messrs. Stevens & Williams, where his artistic abilities and skill have had congenial exercise, and where certain improvements in glass-making itself have been effected by him. His reputation in the glass trade will long live after him.

### ROYAL SCOTTISH ACADEMY.

A GENERAL assembly (which includes Academicians and associates) of the Royal Scottish Academy was, says the *Scotsman*, held on the 12th inst. for the election of three painter Academicians and one architect Academician, in terms of a resolution come to at a previous meeting. The vacancies were caused by the deaths of Mr. G. W. Johnstone, Sir Noel Paton, Mr. J. B. McDonald, and by the removal of Mr. John Lavery to London, who loses thereby his rights as an Academician, though he may still continue to use the letters of R.S.A. after his name.

The result of the voting was that Messrs. Thomas Scott, George Henry, Glasgow; and Mr. R. B. Nisbet were elected painter members, and Mr. G. Washington Browne the architect member. Messrs. Thomas Scott and R. B. Nisbet are water-colour artists.

The voting was as follows:—

First scratching for painter members, including proxies—Mr. Thomas Scott, 24; Mr. George Henry, Glasgow, 23; Mr. R. B. Nisbet, 22; Mr. Robert Noble, 16; Mr. A. D. Reid, Aberdeen, 15; Mr. A. K. Brown, Glasgow, 15; Mr. Pollok S. Nisbet, 13; Mr. Henry W. Kerr, 5. (Nine names received under five votes and were dropped.)

Second Vote—Scott, 24; Henry, 25; R. B. Nisbet, 23; Robert Noble, 17; A. D. Reid, 15; A. K. Brown, 17; Pollok S. Nisbet, 6; H. W. Kerr, 5 (Nisbet and Kerr dropped)

Third Vote—Scott, 26; Henry, 23; Nisbet, 24; Noble, 15; A. D. Reid, 18; A. K. Brown, 17. (Noble dropped.)

Fourth Vote—Scott, 25; Henry, 25; Nisbet, 28; A. D. Reid, 20; Brown, 16. (Brown dropped)

Final Vote—Scott, 24; Henry, 21; Nisbet, 20; Reid, 17.

Vote for Architect Member.—Scratching—G. Washington Browne, 23; A. Marshall Mackenzie, Aberdeen, 11; John James Burnet, Glasgow, 8. Two others having fewer than 5 votes were dropped.

Second Vote—Browne, 23; Burnet, 10; Mackenzie, 10.

In a vote between Burnet and Mackenzie the former got 20 and the latter 18.

Final Vote—Browne, 23; Burnet, 12.

The members of the Academy meet on the first Wednesday of March to determine on the number of associates to be elected to fill vacancies. On the second Wednesday of next month they meet to confirm their resolution, and on the third Wednesday they proceed to election.

At the Scottish Arts Club in the evening there was a large attendance of members, and the health of the new Academicians was proposed by Mr. W. G. Stevenson, R.S.A.

The following are a few notes on the careers of the new Academicians:—

*Mr. Tom Scott.*

The son of a clothier in Selkirk, Mr. Scott was born in that border town in 1854. He was educated at the Grammar School, and worked for some years at his father's business. He commenced his art studies at the Royal Institution in 1877, and afterwards attended the life school of the Royal Scottish Academy. He is a painter in water-colour, and has exhibited almost entirely in the Royal Scottish Academy Exhibitions, his painting ground being largely the romantic scenery of the Borders. Some of his more important works are, "The Otter Hunt," the "Meet of the Duke of Buccleuch's Hounds at Riddell," "Return to Selkirk from Flodden," "The Legend of Ladywood," "Moss Troopers Returning from a Raid," "The Riever's Ride," "A Mosstrooper Scout," "Hornshole, 1514," "The Wood Waggon," "Newark Castle," "St. Mary's Loch," &c. He was elected an associate of the Academy in 1888. From time to time he has had sketching trips in France, Switzerland, Italy and Tunis, going to Florence and Rome and Naples to see the works of the old masters. At present he is engaged on two pictures, one from the Border ballad, "The Border Widow's Lament," and the other from "Autumn Leaves," one of J. B. Selkirk's poems. For many years Mr. Scott has been much interested in the collection and preservation of Border antiquities, and has made a large and interesting collection of prehistoric relics belonging to the Border counties. Of these a large selection was shown at the recent Glasgow International Exhibition, and attracted a good deal of attention from people interested in the subject. Along with other water-colour artists exhibiting at the Royal Scottish Academy, Mr. Scott vigorously protested against the method of hanging works in that medium at the Mound exhibitions, and as no redress could be obtained, he did not send any works to the last exhibition, and he does not exhibit on this occasion either.

*Mr. R. B. Nisbet.*

Mr. R. B. Nisbet, who is a native of Edinburgh, commenced life as an apprentice in a Leith shipping office. He took to art in 1879, and went with his brother Pollok to study at Venice. Returning, he joined the Board of Manufactures' School, where he drew from the antique and life. His first exhibits at the Royal Scottish Academy were in oil, but soon he took entirely to water-colour. He has sketched mostly at Cromarty, Gullane, St. Andrews, North Berwick, the Fifeshire coast, Selkirk, Surrey and Yorkshire. He first exhibited in the Royal Academy in 1888, in which year he was elected to the Royal Society of British Artists. In 1892 he was elected to the Royal Institute of Painters in Water-Colours, and in the following year was elected to the rank of an associate of the Royal Scottish Academy. He is also a member of the R.S.W. He leans to the romantic side of his art, but is catholic enough in taste to admire all styles. He owes his own admirable style chiefly to strong admiration for the works of De Wint, Cox and Cotman in water-colour, and Chrome and Constable, along with the Barbizon school, in oil. Some of his works which brought him into prominence before he was made an associate were "Evening Stillness," bought by the Chantrey Bequest; "Solitude," "Harrowing," "Forenoon" and "Sunset on a Border Moor," and since then in a broad and free method he has exhibited many charming works in which his aptitude for painting cloudland and sky have been very marked. Mr. Nisbet's art has had wide recognition both at home and abroad. He has been made an honorary member of the Royal Belgian Water-Colour Society, and he gained at the Vienna Jubilee Exhibition the only gold medal for water-colour in the English section. He was also awarded a medal at the Antwerp International Exhibition; he holds various diplomas, and pictures of his have been bought for the permanent collections in Berlin, Dresden, Lille, Durban, Adelaide, Pittsburg and other towns. He took an active part in the formation of the Society of Scottish Artists, and has held office in that body.

*Mr. George Henry.*

Mr. George Henry, who made his name as an early member of the "Glasgow school," does a good deal also in designing. Landscapes with figures or cattle formed the subjects of his earlier pictures, but he has shown remarkable versatility in his

choice of themes, and his power of expression has been equally marked, whether the subject is treated in oil, water-colour or pastel. The decorative quality of colour and line in his work became more pronounced after 1883, and is specially noticeable in his "Willows," painted two years later. About the same time his "Mushroom Gatherer" attracted considerable notice, and one of his most notable works, though it provoked some criticism at the time, was the "Galloway Landscape," exhibited in 1889. Another notable picture was "The Druids," a voyage to Japan, rendered necessary on account of his near blindness, was productive of many studies illustrative of Japanese life, pictures, whether in oil, water-colour, or pastel, showing a thorough grasp of the characteristics of his subjects. Two of the most notable of the class were "A Japanese Belle," exhibited at the Water-Colour Society's Exhibition of 1894, and "Brown Kimono," shown at the St. Louis Exposition in 1904. On his return to this country in 1895, Mr. Henry took to portrait painting, and proved equally successful in depicting children, women, or men. Among the best known of his group are the portraits of Dr. Campbell Black and the child of Mr. T. G. Arthur. He was elected an associate of the Royal Scottish Academy in 1892.

*Mr. G. Washington Browne.*

Mr. G. Washington Browne was born in Glasgow, and received his early training there. He afterwards proceeded to London, where he served under one or two architects of distinction, and gained the Pugin Travelling Studentship, being the first Scotsman to secure the honour. His drawings made in connection with this studentship, and while travelling in France, Italy, and Spain, were afterwards published in a folio volume, and with much acceptance. On returning to Scotland, he became a partner with Dr. Rowand Anderson, and afterwards by himself carried out the Edinburgh Public Library, the Children's Hospital and Messrs. Redfern's buildings in Prince Street. He has made a special duty of library planning and construction, and besides erecting several libraries throughout the country, has acted as adviser and assessor to library committees. Some years ago he entered into partnership with J. M. Dick Peddie, and the firm has erected a considerable number of banks and insurance company buildings, two of which are shown on the walls of the present exhibition. Among the most recent of this description of building with which the firm's name is identified are those of the Standard Assurance Company in George Street, Edinburgh, the office of the Scottish Provident Institution, to which considerable additions were made, and the buildings of the Scottish Equitable Life Assurance Society, both in St. Andrew Square, Edinburgh. Mr. Browne was elected an associate of the Royal Scottish Academy in 1892.

## SCOTTISH ACADEMY'S EXHIBITION.

THE exhibition of the Royal Scottish Academy was opened on Saturday. It is, according to the *Scotsman*, a good strong, average exhibition, with some outstanding and welcome features, while the general body of the work, both by academicians, associates and those outside the academic circle, is of a varied and interesting nature. Several beautiful pictures have been obtained on loan from foreign and our artists, notably one from that accomplished French artist M. Dagnan-Bouveret; and there is a small show of paintings and drawings by the late Sir Noel Paton, and of paintings by the late Mr. J. B. MacDonald, which have a melancholy interest. Several of the academicians are painting strongly at present, and do themselves credit by the works they exhibit. An effort has been made, chiefly owing to the exertions of Mr. Pittendrigh Macgillivray, who is a member of Council this year, to revive an interest in the sculpture department by obtaining from two or three French, Belgian, Russian and London sculptors examples of their work, which, with local busts and fancy figures, are decoratively disposed throughout the entire length of the galleries. This for the first time probably, there is a small but elegant collection of what the French call "objects of art," included under that heading being many choice pieces of jewellery, which should be specially attractive to ladies who wear it and craftsmen who make it. The old dispute as to the placing of water-colours and architectural drawings has not yet been satisfactorily solved. The water-colours are hung in several places, and it would almost appear as if that and other points of a similar kind could only be met by the Academy boldly facing the question, which cannot much longer be delayed, of getting more accommodation, either in the present buildings, the Royal Institution or elsewhere. As usual the number of works entered in for consideration was large. Of all classes the number was 1,782, and of these there have been placed 789, which is fewer than last year. The details of the figures may be interesting. They are:—Oils—accepted, 100; doubtful, 359; rejected, 400; total, 859; water-colours—accepted, 56; doubtful,

rejected, 253—560; miniatures—accepted, 16; doubtful, 1; rejected, 2—33; sculpture—accepted, 18; doubtful, 22; rejected, 5—45; architectural drawings—accepted, 10; doubtful, 1, 26; rejected, 18—54; black and white—accepted, 11; doubtful, 29; rejected, 18—58—in all, 1,609. Members' and their works by request, 173; grand total, 1,782.

The loan exhibits in sculpture, if not great in number, are certainly remarkable for variety and quality, comprising, as they do, examples from three or four of the most prominent masters of the art in Europe. The names have only to be mentioned, and the interest of the connoisseur will be immediately aroused. They are Rodin, Dalou, Dillens and Prince Rouhetskoi, the great Russian sculptor, who made such a mark for himself in the last Paris International Exhibition. He sends here a most artistically-handled equestrian group, entitled "Tolstoi," also a sketch for a monument to Dante, an original conception which strikes a profound note. Dalou sends his "Lavoisier," the intense concentration of which, in pose and expression, at once arrests attention. The technique may be thought a little dry, but there can be no doubt of the keen, nervous quality of every line in it. It is the portrait of a scientist, and all that masterly science in the art of sculpture can do is to be seen in the production of it. It is the Frenchman at his best in a medium allied with a subject that he is master of. From this he turns to "Eve," by Rodin, and finds a quite different attitude towards the medium. In this work is to be seen the struggle to express in material form the vague qualities of things abstract. Between these two works ("Eve," by Rodin, and "Lavoisier," by Dalou) the history of modern sculpture might be written and all the battles of its criticism. In Dillens we have a master of the Belgian school, whose forte is decoration. He is here represented by a bronze from his study for the figure "La Gloire," which stands in the Botanic gardens of Brussels. It is one of a series of about fifty pieces of sculpture commissioned by the town of Brussels to aid the cultivation of sculpture in Belgium. Many of the subjects given were personifications of plants. "La Gloire" represents the laurel, a sprig of which in token of victory the youth thrusts aloft. There is a fine enthusiasm and abandon about the work—a broad picturesqueness which speaks of the northman as against him of the Latin race. It has been suggested that the Board of Manufactures, or whatever other authority has charge of the aid for the benefit of the Scottish National Gallery, might see their way, in the interest of sculpture, to add this piece, "La Gloire" and the superb "Lavoisier," to the national collection. The Royal Scottish Academy make, as has been said, a new departure this year, and so follows in the wake of progress elsewhere by showing a fine collection of jewellery—sculpture in little. Works in this genre have been honourably placed and regarded in all the academic exhibitions in Europe and in the Royal Academy at home, and the Royal Scottish Academy need make no apology for these pleasing exhibits. Two of the cases contain works from architects, that of H. Wilson being the more important. He also sends a crucifix and chalice of great beauty. Mr. Cromer Watt, Aberdeen, shows three charming necklaces jewelled and partly enamelled. Nelson Dawson also shows a fine collection of work in silver and enamel. All these works are personally designed and mainly executed by the hand of the artist, and are therefore as much to be regarded as expressions of character as the productions of other mediums. Art more readily accepted by the public. There is a large medal from Mr. Pickford Marriot, London, in rich inlay of mother-of-pearl and painted gesso, which will surely prove an object of pleasure to many. His Madonna in last year's Royal Academy, and another large panel in mother-of-pearl and precious metals, received great attention. The medium is a revival of an art which had come to be regarded as almost forgotten or lost. In Marriot's hand it receives a new grace and a higher artistic quality, perhaps, than it ever had before. Taken altogether, the sculpture-room will have more interest this year than formerly, and the standard shown will, it is to be hoped, have a highly educative influence on those students of the art in Edinburgh, who must doubtless sometimes suffer from the absence of that vitalising element in surroundings which is the favour of their confrères abroad. The local sculptors also are well represented.

### THE DREI MOHREN, AUGSBURG.

ACCORDING to the *Frankfurter Zeitung*, a famous hostelry, the Drei Mohren, in Augsburg, having fallen in evil days, is about to come under the hammer. Built in the early years of the sixteenth century by Hans Herwart, a wealthy merchant of Augsburg, and bought from him in 1560 by Jacob Fugger, the Rothschild of his time, the house passed through the hands of various private owners, until in 1723 it was

bought by one Andreas Wahl, and by him converted into an hotel. It is probable that the Emperor Charles V. stayed in the house in Herwart's time, and the Emperor Maximilian is known to have been Jacob Fugger's guest there in 1566. The list of illustrious and famous personages who visited the house during its palmy days as a hostelry, when Augsburg was a much-visited town—apart from its own attractions, it was a kind of half-way house between Ulm and Munich and a natural halting-place on the journey to and from Switzerland and Italy—seems an endless one, and the guest-books of the hotel, which seem to have been carefully preserved, must be very interesting reading. In 1792 Kaiser Francis II. stayed there with his wife Maria Theresa. In 1801 Napoleon stopped at Augsburg, and many of his generals stayed at the Drei Mohren, Napoleon himself occupying the episcopal residence. The Empress Josephine was a guest in 1805 on her way to Munich, whither Napoleon had summoned her. Late in December of the same year the Bavarian Major von Hausmann signed the guest-book, and opposite his name appears the statement that he came "to occupy our free town in the name of the Prince of Bavaria." On March 3, 1806, the formal delivery of the town to the Bavarian Commissioners was celebrated by a great banquet at the hotel. In 1810 the Archduchess Marie Louise stopped there with a great suite on her journey to Paris to supplant the divorced Josephine. During the later Napoleonic wars there was much journeying of soldiers and diplomats backwards and forwards through Augsburg, and we find in the guest-book of the Drei Mohren the names of Metternich, Castlereagh, Canning, Wellington, Talleyrand, and others entered, on their journey to the Congress of Vienna. Soon, however, the stream was turned in the opposite direction, and there was great journeying of notables to France, where Napoleon had reappeared and was showing very scant respect for the decrees of the Congress.

After Napoleon's final fall the Drei Mohren sheltered Jerome, Fouché (who signed himself Duke of Otranto), Count Walewski, Gustavus Wasa and other of the great Corsican's protégés who had shared in his fall. In the following decades we find names whose fame is of a different kind—Feuerbach, Lamartine, Walter Scott, Paganini, Spontini, Uhland. In 1866, on August 24, the German Federation was dissolved in Augsburg, and here again the Drei Mohren was the scene of the formalities. This was Augsburg's last appearance as a "Weltstadt," and since then, though the Drei Mohren has extended its hospitality on several occasions both to the old Emperor William and to his son, who as Crown Prince was immensely beloved in Augsburg, as indeed throughout Bavaria, and whose visits were always made occasions of great rejoicing, both Augsburg and its famous *Gasthof* have suffered eclipse. Augsburg is no longer a great place of call; the travellers who would once have stayed there are now whisked past it in the Orient express, and the Drei Mohren is fallen from its high estate—fallen so far that its present proprietor after long struggle against the inexorable kind of adversity which changed social conditions often bring with them, finds himself compelled to offer the historic old house to the highest bidder.

### STONEHENGE.

THE charities and records committee of the Wilts County Council, after exhaustively considering several important matters connected with Stonehenge, have reported to the County Council in favour of a recommendation to the Commissioners of His Majesty's Treasury that negotiations with Sir Edmund Antrobus be initiated or renewed with a view to the acquisition of Stonehenge as a national monument, and that the Treasury be further informed that after such acquisition the Wilts County Council would be willing to undertake the guardianship of the monument. The Amesbury Rural District Council have failed to take action on a representation from the Amesbury Parish Council with reference to a petition as to the obstruction of an alleged public right of way leading to Stonehenge, and it has been decided to appoint a committee of the County Council, consisting of the chairman, the Marquis of Bath, and Mr. J. M. F. Fuller, M.P., to hold a public inquiry into the subject-matter of the petition.

The Improvements Committee of the Glasgow Corporation has recommended the acquisition of about 50 acres of ground on which to erect houses for the poorer and labouring classes who may be displaced by the improvement operations of the Corporation under existing Acts of Parliament, or in exercise of the powers which may hereafter be conferred upon them for dealing with insanitary and congested areas within the city. For the acquisition of the ground the committee recommend that power be asked to borrow 750,000*l.*

## NOTES AND COMMENTS.

THE contest before the Examiner on Standing Orders over the Brighton Electric Railway Bill is being fought with a vigour which recalls the old days of railway campaigns. It would seem that the practice of opposing Bills on points of another class than plans and sections has not been favourable to accuracy, for some of the surveyors employed on the new line have been strangely careless. The allegations on account of defective plans were unusually heavy in number, and several have been already decided in favour of the opponents and against the promoters of the Electric Railway Bill. In one instance it was shown that the railway could not be constructed as laid down on the plans without going through a station of the London and Brighton Railway Company. In fact, Mr. MORGAN, the chief engineer, said that in cases where the Ordnance map was followed there was accuracy, but where anything was added there was error. In one case a whole valley seemed to have been left out. The description of houses was prepared in such a manner that, according to the Examiner, it was very difficult, almost impossible, to test the accuracy of the statements contained in it. He said it seemed to him that the statement amounted to a very perfunctory compliance with the Standing Orders, and he must, therefore, sustain the allegation. With regard to the latter point, some allowance must be made owing to the changes which have been introduced in the Standing Orders with regard to houses. Formerly it did not matter how many people occupied a house. One number on the plan and one number in the reference book sufficed, although it might contain a great many tenements. By the latest amendments one room, if a separate dwelling, must be distinguished. In such a case there may be an excuse owing to the difficulty of getting up information in a hurry. But what is to be said when railway sidings near the Streatham Hill station are shown on the plans as gardens attached to houses? The Examiner's report will be considered by the committee on Standing Orders, but enough allegations have been sustained to make it doubtful whether the Bill can ever reach the stage of the first reading.

DR. HEIN, of Vienna, is now engaged in southern Arabia in exploration of remains in the ancient kingdom of Saba, or Sheba, which is now receiving more than usual attention from archæologists. It is announced that the Turks have discovered several ruins in the districts known as Kaasa Redah and Kaasa Ans, which have been mentioned by an Arabic writer in the tenth century. They have met with an immense number of inscriptions on marble slabs, which confirm the statements of GLASER, to whom the credit is due of first suggesting the interest of the country. Figures in marble and bronze, as well as ancient coins, have been secured. There are districts as yet untouched which are described as being rich in remains. All objects found have to be sent to Constantinople, but it is never difficult for another country in favour with the Porte to obtain a liberal share of antiquities by a moderate outlay.

LITTLE is known about the works of MYRON, the Greek sculptor, although it would appear that he produced a variety of statues, some of them being remarkable for their suggestion of action. His name, however, lives through his courage in representing animals at a time when heroic figures were the fashion. MYRON'S cow inspired a great many Greek epigrams. In the eighteenth century LESSING treated at some length of so renowned an animal, and other critics have followed his example. GOETHE believed the cow was a sublime symbol suggesting the nourishing principle of nature which is presented to us in countless variations throughout the universe. A case is now before the French courts which shows that simple as the cow may seem to be as a subject, and restrained as it is in posture, it can afford an opportunity for the skill of an army of lawyers. The circumstances were almost commonplace. A porcelain manufacturer in Limousin, of which Limoges is the capital, considered an acceptable prize in the numerous agricultural shows of the district would be a group corresponding with MYRON'S, of a cow and a calf. He gave a commission to M. BUREAU, a sculptor. The artist wished

to be true to local varieties, and he used animals belonging to M. TEISSERENC DE BORT as models. He even gave the copy the names of the originals, viz. Guine-Rouge. The manufacturer sent an example to an exhibition in Paris. It was at once seized because it was alleged to be a counterfeit presentation of a group by the late M. M. Artists like MM. DETAILLE, BOUGUEREAU, CARO, DURAN, FRÉMIET, have testified to the correspondence between the two groups. On the other hand, agriculturists and various authorities in Limousin have vouched for the fidelity of the portraiture of the cow and the calf, as the originals were well known. Both sides have provided copies, and the French Court has during the hearing assembled a dealer's shop. It will take some time before a decision in so important a case is arrived at, and it is hoped to warn other sculptors against attempting to rival the reputation of MYRON.

THE Château de Vincennes is unquestionably outside the fortifications of Paris, but Parisians hardly recognise it as suburban. From this peculiarity it is less often inspected by tourists than it deserves. The society known as "Amis des Monuments Parisiens" lately visited the building and were enabled to see more than the ordinary spectators. The history of Vincennes goes back for 1,100 years. 807 it belonged to an abbey. Then it was transformed into a royal hunting lodge. St. LOUIS when king held court there, for he was able to dispense justice under the trees of the neighbouring forest. He is said to have 400 officers and servitors, and the annual expense 1,357,000 francs. Our HENRY V. died in Vincennes in his thirty-fourth year. He had set out to the relief of Calais but he became so ill at Corbeil that he was carried to Vincennes, and there after a month expired. Many discomfitures in France were the consequences. His body was buried in the cemetery of the château, but the floor which was taken from them by boiling, was removed to England. The trilogy of "Henry VI." begins with the funeral in Westminster Abbey. LOUIS XIII. preferred Vincennes to his other residences, and with him MAZARIN lived. Several of the rooms were constructed or altered under the direction of the Cardinal. The apartments now occupied by the general in command of the fortress MAZARIN died there. The last historic incident connected with the fortress was the trial and execution of the Duke of ENGHEN in 1804. The donjon, which was used as a residence by King CHARLES V., was the prison of the Duke of CONDÉ, Cardinal DE RETZ, DIDEROT and MIRABEAU. A visit to the château was one of the most interesting of those organised by M. CHARLES NORMAND, architect.

## ILLUSTRATIONS.

WEST FRONT, ROMAN CATHOLIC CATHEDRAL, WESTMINSTER. DETAIL.

THE LONDON, CITY AND MIDLAND BANK, NORTH STREET, LEEDS. THE new branch bank erected by the London, City and Midland Banking Company is situated at the corner of North Street and Meanwood Road, Leeds, holding a commanding position, and eminently suitable for banking premises. The principal entrance is at the south-west corner of the building. The banking-room is 42 feet by 29 feet by 22 feet high, with a decorated wagon-shaped ceiling; a private office is provided for the manager, and fittings are of American walnut.

The strong rooms, &c., are placed in the basement, a hydraulic elevator is erected for the service of the bank and bullion. The first and second floors are designed for the manager's residence. At the angle of the building a clock turret is placed, which is illuminated at night by electricity. The banking-room and basement are warmed by hot-water coils. The vitiated air shafts are carried above the roofs for the ventilation of the premises.

The whole building is fitted with the electric lighting. The new bank has been designed and carried out under the supervision of Mr. WILLIAM BAKEWELL, architect, Leeds.

## THE ARCHITECTURAL ASSOCIATION.

MEETING of the Association was held on Friday evening last, Mr. W. H. Seth-Smith, president, in the

The following were elected members:—Messrs. P. W. G. Hall, C. K. Roe and B. Drummond.

Donations towards the new premises fund had been received from:—Mr. C. B. Arding, 5*l.*; Mr. Arthur Harston, 1*s.*; Mr. H. Dymoke Wilkinson, 2*l.* 2*s.*; Mr. A. H. Ryan, 2*l.* 2*s.*; Mr. H. I. Potter, 1*l.* 1*s.*; Mr. T. R. Hooper, 1*s.*; Mr. V. Wilkins, 1*l.* 1*s.* Total amount, 3,710*l.* 1*s.* 6*d.*

Miss ETHEL M. CHARLES, A.R.I.B.A., read a paper

## A Plea for Women Practising Architecture.

I appear before you to-night with a certain amount of diffidence, as the subject under discussion is not of my own choosing, and I fear I cannot do it justice. The title, to start with, is somewhat misleading. The dictionary says pleas are a lame excuse or apology. Now, I do not propose to make any lame excuses or apologies, all of which would be unnecessary under the circumstances. I shall merely bring to your notice some facts relative to woman and architecture, most of which you are, doubtless, already familiar. Then, in the title seems to suggest that I am conscious of a prejudice against women architects, and, since I read the paper for your Association, it further implies that I believe such prejudice is to be found amongst your ranks. Now, I wish it to be clearly understood that I disclaim both of these assumptions. Doubtless your committee had their thoughts directed to the choice of this subject by the knowledge of the existence of this feeling; but, personally, I have never met it. No one has ever maintained before me that a woman should not practise as an architect, and, if this view is held, I venture to say it can only be held by those outside the profession, who are consequently not acquainted with the functions, powers and responsibilities of an architect.

Since you are members of the profession, it seems superfluous to address you on the subject, as you must know better than any one what are the qualifications necessary for the exercise of the same, and therefore know better than any one that it is not a case of man or woman being best fitted to practise this art, but that it is entirely a case of personal ability.

In a back number of the *British Architect* I came across the following remark:—"Whether women, as a whole, are fit to take up the profession of architecture we hold somewhat strong and, it may be, conservative views—views which I do not think it would serve any useful purpose to discuss." It is very much that some one present holds similar strong conservative views, and that he will be kind enough to discuss them to-night, as I may tell you the subject was introduced by your committee as being a peculiarly useful and debatable one.

It would be a bold man who would assert that "women as a whole" are fitted to take up the profession, considering so many women have turned their thoughts in its direction; but it would be a still bolder man who would assert that men, as a whole, are fitted to take up the profession, *vide* the enormities we daily committed by men in the name of architecture. It is not a case of men *versus* women; it is a case of individual capability and aptitude.

However, there are some people, we are given to understand, who maintain that woman, *per se*, is unsuited for practising our art. Wherein the weak point lies we shall, no doubt, discover in the course of the evening; but as far as I can see, it lies outside the woman, and is not a defect inherent in her. I suppose the reason why woman should not practise architecture is because, except in one or two isolated cases, it is not practised it hitherto; and this is no reason at all. The same objection is brought forward every time that women have attempted to enlarge their sphere of action, and yet many new proofs are given that intellectually women can, at least in many cases, hold their own with men. The results of university examinations show it; members of the medical profession testify to it; the legal profession numbers women in its ranks, both in France and in America, though up till now in England women have only been allowed to study for, but not to practise at the Bar. "Let them study by all means," the conservatives say, "but draw the line at practise." And what is the use of instruction, I ask you, if it is to be turned to no account? What is study without an object? Knowledge without application? It is simply creating wants without satisfying them. Living is not learning.

Then, it is granted that woman is intellectually capable of dealing with the problems of architecture, are we to say that she is physically incapable of carrying on the work entailed? It were unreasonable to say her strength is unequal to the task when we see what women actually do in

this country. Take chainmakers, for instance. Hundreds of women are employed in the very heavy work of chain-making, a most arduous trade, and you must remember how two or three years ago certain philanthropists were anxious that legislation should put a stop to this, as they asserted the work was too great a strain for a woman. This intervention only resulted in the Home Secretary being besieged by indignant deputations of these same women, all protesting their competence and defiantly baring their muscular arms as evidence of the strength on which they prided themselves. Then, again, our agricultural labourers are not by a long way all men. In harvest time, when the work requires to be got through with all speed, women are called upon to labour side by side with their husbands and brothers; they toil from earliest dawn to latest twilight, through all the burning heat of the early autumn day, and so far from succumbing to this exposure, they weather it with the best of the men and live to seventy and eighty years of age. Now the bodily fatigue an architect must be prepared to undergo cannot be compared to the physical strain our women endure when employed as field farers or as chainmakers.

I do not mean to make light of the arduousness of the profession. The mere study of architecture involves a great deal of physical as well as mental strain, and since practice means the continuance of study and added to this responsibility, the profession is certainly not one to be adopted by the physically feeble. But women are not all physically feeble any more than men are all physically strong. You have heard of architects—men—breaking down through overwork, but you would not for that reason say that all men are unfitted to practise the profession. I have never heard of a woman architect breaking down, but neither do I assert that all women are fitted to practise architecture.

Those who base their objections to women architects on the fact that they are an innovation, and therefore to be suppressed, will fling their prejudices and fears to the winds when what is now an innovation comes to be a recognised institution. Already in America one town has a lady for a consulting architect, and we are given to understand that her designs for schools, prisons and railway stations compare favourably with other similar works in the country.

But there are some opponents who are more specific in their objections, and it is with these we must now deal. Their objections really arise from an imperfect knowledge of what an architect is. There is a general idea afloat that architects "make plans" and climb ladders, but beyond these two accomplishments nothing certain seems to be known. The former occupation is acknowledged to be quite a legitimate one for a woman, provided she have the necessary gifts, but the latter cannot be countenanced for a moment, even though she may be sufficiently courageous to attempt it, and can be trusted not to lose her head on the scaffolding. As far as I can gather, it is not the climbing that is objected to, but the fact that she may be seen climbing a ladder. Therein lies the difficulty. No less an architect than Wren shows us a way round, if not over it. The famous Duchess of Marlborough informs us Wren "was content to be dragged up in a basket three or four times a week to the top of St. Paul's, and at great hazard, for 200*l.* a year." No one could object to a woman being hoisted up in a basket any more than they could object to her making use of the more conventional elevator. Climbing a ladder is condemned as unwomanly, but so was riding a bicycle or being seen on the top of an omnibus not so very long ago, and yet all are now seemingly reconciled to these unwomanly practices. Besides, the ladder question could only be raised by persons who are in ignorance of the portion of a lifetime that an architect spends upon a ladder, and as this is so infinitesimal it is unworthy of consideration.

But besides the objector to innovation and the objector to ladder-climbing, there is the man who has dealt personally with architects as their client, and who knows very definitely what an architect is and what he expects from him. He must be a thoroughly artistic, scientific and practical man. He must be able to design at all possible speed a convenient, durable and beautiful building of any one of the three groups into which buildings may be roughly classified—Domestic, Ecclesiastical and Civil. He must have an intimate and familiar knowledge of every material and every trade employed in the realising of the said building, in order that none but the best of its kind and the best of technical skill may be employed. He must be a master of scientific construction, in order to prevent waste of time, material and money. He must keep all accounts relating to the work, bear in mind the interests of client and contractor and manage everything without allowing any friction to come about between the different parties concerned. This list is not complete; I have mentioned but a few of the functions required by an employer of his architect. For the sake of argument we will suppose that they appear to offer just so many obstacles to a woman following the profession.

I use the word "profession" because it covers more requirements than art, craft or faculty, and though it has been

weighed and found wanting, it appears to be the word in most general use when connected with the practice of architecture.

To succeed in architecture one must be, as I have said, artistic, scientific and practical in business matters; that is to say, success is largely a matter of natural gifts, education and experience. Now, who will assert that the necessary gifts are not and cannot be possessed by woman; that she does not receive the requisite general education, and that experience may not be acquired by her as well as by man?

Let us look first at the æsthetic side of the question. Architecture has been defined as good construction inspired by an artistic motive or by the instinct of the beautiful. Now this instinct of the beautiful, or, as the French put it better, "*ce sentiment du beau*," is as a rule more strongly developed in the woman. Nearly every woman is more or less impressionable, that is, she is an artist by temperament. Her taste will lead her instinctively and intuitively to a result which a man will reach by a series of criticisms and reasonings. He sees the truth, she feels it. The beautiful is attained by both; what matter if the paths they follow are different?

In most cases (outside the profession, be it understood) who is it who cares to be surrounded by beautiful objects and attempts as far as is possible to make the home a thing of beauty? It is certainly not the average man, who so long as he is comfortable cares little for the appearance of his surroundings. It follows, then, that it must be the woman, who will cheerfully sacrifice even comfort to her conception of beauty, if any choice have to be made between the two.

Some people go so far as to say that a woman must necessarily know how to plan a house better than a man, because her household duties suggest to her the wants and requirements that must be met. We do not agree with this view. The best housekeeper in the world may have most definite ideas as to what she requires, but she will not produce a plan, that is, the suitable disposition of spaces, till she have learned what rules and precepts must be obeyed in planning a house. And these rules, being all based upon common sense and obvious reasoning, are as patent to men as they are to women.

We must not, however, lose sight of the fact that the influence of woman in domestic architecture has been felt ever since the progress of social relations made her the equal instead of the slave of men. Woman's position in a country is the surest sign of the social progress in that country, and it was in the sixteenth century, when women began to be respected "as a whole," and not in individual instances, that domestic architecture regained its prominence. It was when a woman ruled this country, and by her personality influenced many, that castles, cathedrals and colleges—buildings designed for men by men—ceased to be the most important architectural objects erected. Elizabeth's reign is remarkable for the number of radical changes which took place, and in no direction was the change so marked as in architecture.

At the time when, under James's rule, the Scotch were dwelling in fortresses about as comfortable as a Norman keep, the English under Elizabeth were vying with each other as to who should build the most roomy, most convenient and most beautiful houses. It is noteworthy that the great queen spent not a penny herself in the interest of building, but she gave her noblemen much moral support, encouraging them to spend their thousands in erecting palaces worthy of receiving her as a guest. One of the most indefatigable builders of that time whose name has come down to us was a woman, Elizabeth of Hardwicke. Of the "three most elegant seats that were ever raised by one hand," so says her biographer, only Hardwicke Hall remains, and, judging from its monotonous symmetry and extravagant window-space, we have, it seems, little cause to regret old Chatsworth and Oldcotes. Besides her three country seats, this lady left "stately almshouses for twelve poor people" in Derby, and personally superintended the construction of "a splendid mural monument" to her own memory in All Saints Church, Derby. Her biographer, alluding to her passion for building, describes her as "a woman of a masculine understanding and conduct; proud, furious, selfish and unfeeling." Apparently we are to gather that these unattractive qualities, pride, violence and egoism, go hand in hand with a masculine understanding. If, as Hardwicke shows, she lacked artistic feeling, she was, on the other hand, a thoroughly practical woman. Of the four husbands she outlived, three were wealthy men who were able to supply her with the means of indulging in her favourite pursuit.

In France, where women stand out more prominently than in England, and during the early Renaissance, when they were most conspicuous even as politicians, warriors and poets, we find them occupied with building at an earlier date than at home. Marie de Pierre-Vive, Dame du Perron, one of the ladies of the household of Catherine de' Medici, was officially associated with Philibert de l'Orme during the erection of the Tuileries. In 1566 her name stands among the list of "*MM. les Surintendants des Bastiments du Roy*," and it is interesting to note that where she and de l'Orme signed papers together, Dame du Perron's name comes first. Her royal mistress was

another woman of "a masculine understanding," and, in on her own plans being used for her palace. *De l'Orme* to her, "*Lequel Palays je conduis de votre Grace suivant vos dispositions, mesures et commandement qu'il vous a plu faire.*"

But however artistic a woman may be, her natural alone will not suffice any more than will those of a man, out study and direction. Art has its restrictions and its limitations, which must be recognised and appreciated if true nature are to be our guides; and architecture is particularly restricted and limited in theory and in practice. In theory it is bound by those rules of art inspired by taste and traditions, and by those rules of science which can be demonstrated by invariable and absolute formulae. And in practice it is limited by structural conditions, which, if neglected, in the collapse of the building; it is limited by the physical properties of material, by the climate, by the habits and necessities of the moment.

Study of æsthetic rules produces fine designs, and scientific laws produces fine construction. Construction demands a knowledge of the principles of mathematics, besides a knowledge of the properties of building materials. Now mathematics involve logic, or the science of reasoning correctly, and hitherto logic has been held to be the prerogative of man as opposed to woman. It may be granted that among uneducated women possibly a large proportion are more illogical in their everyday conclusions than among an equal number of uneducated men; but it by no means follows from this that the brain of the average woman is less capable of mastering the science of mathematics than that of the average man of education. Now we are discussing cultivated women, and all reference to the uneducated and illogical class is beside the question. That mathematics can be mastered is proved by the successful results achieved by women at the universities, where they show peculiar aptitude for the science of mathematics, the numbers who devote themselves to this study being great, out of all proportion to those who select other schools or triposes. Again, at the École des Beaux-Arts, where the architectural course includes, among an immense variety of other subjects, a very high standard of mathematical ability, a woman, an American, has lately won the honour of carrying off the Premier Prix over the heads of her brother students.

But pure mathematics are of little use without familiarity with the properties of building materials, and this familiarity, it is argued, can only be gained by a technical knowledge of the trades employed in building. In the Middle Ages the architect was only distinguished from the workman by his conspicuous natural gifts and greater skill in technique; he was most familiar with his materials and produced the designs. The workshop was then the training-ground of the architect, and doubtless would have proved a school for a woman. But now, however much the fact is deplored, most of the architect's work is produced in an office and not in a workshop, and is due more to his intellectual activity than to his manual skill in any trade. If, then, the design depends upon the proper use of material, and the design may only be learnt through handling it, how comes it that designs are produced by men who are in no way fitted with such material, and that, on the other hand, most of the best builders who dispense with the services of an architect, many of whom are skilled in one or more trades, produce results which, though they strive after, fail to realise the architectural effect? The answer is simple. It is largely a lack of education and preparation which enables the student to grasp more readily the principles of the art than the skill. This general education is indispensable to architectural study, and since there is but slight difference nowadays in the course of education pursued by men and women, I cannot see that the absence of workshop training should nowadays be a woman more than it does a man. Do not mistake me. Education cannot create the gift of design, for design, like poets, are born not made; but it fosters and encourages this gift and calls out the highest faculties when they are latent in the student. No amount of training will make the dumb to sing; but, for all that, training is invaluable, and I say essential, to a singer who means to do his voice justice. I may be allowed a misquotation:—

Books, gowns, degrees will leave a fool a fool,  
But designs are best when the designer's been to school.

Granted, then, that woman is fully competent as far as the æsthetic and scientific sides of the profession are concerned, there remains the economic side to be considered. There are all the business transactions that take place between the architect, client and contractor, and involves the exercise of a large amount of tact in order to make matters run smoothly. Without tact a business man will not go far, and the tact and sensible quality seems universally acknowledged to be possessed out more generously to woman than to man. In France

man is born a business man, and her taste is never questioned, whereas in England it is the exception to find a man combines artistic talents with business qualities.

The stumbling-block in the business relations seems to be the architect is responsible for the quality of the work, and so has to oversee and direct the workmen. This some reason is supposed to be beyond the powers of a man; I am told, it is objected, she cannot use the necessary amount of strong language to keep the workmen up to the mark. But surely there are other ways of enforcing your will through the medium of unseemly language. There is not a man in twenty who has realised that gentleness may be a virtue. A man will boast of his want of self-control; he flatters himself that abusive language shows him to be a man of strong character, a master; he would count himself less manly were he less violent, and yet you must confess that some of the best men you know happen to be those who always get their own way and compel people to carry out their wishes whether they will or no. St. Paul's Cathedral, one of the finest examples of Renaissance work we have in England, is a living example of what workmen can produce without the stimulus of force. When held the "ungodly custom of swearing" in such reverence that he posted up an order to the effect that, upon sufficient proof, the clerk of works should dismiss any labourer guilty of this crime, and further that "if any master working on his apprentices, servants and labourers, it shall be deemed his fault, and he shall be liable to be censured by the Commissioners." Besides, swearing at one's subordinates is not as fashionable as it used to be. In the army and navy, where formerly the slightest order was accompanied by a volley of oaths, the change is strongly marked, and the man who now so far forgets himself as to swear at his men is himself open to a severe reprimand from those who are of a higher rank to that which he holds.

I think I have touched upon most of the points which might be brought forward as objections to women practising architecture, and I trust we shall all be agreed that the obstacles are more imaginary than real. But there is one other point I wish to refer to before closing, and that is the "new style" which people are clamouring for. Since women began to study architecture it has been suggested that they may supply this long-felt want, but as yet there has been little to warrant the hope that the fresh inspiration will come from that quarter. Women make intelligent interpreters and passionate advocates, but, to judge from the testimony of bygone centuries, their power stops short at creation. It may be wrong to say that woman is totally wanting in inventiveness, and it will be a question of upbringing and training. Hitherto men have always led the way, for the race is to the swift and the battle to the strong, and men have been the swift and the strong; since women's upbringing taught them only dependence and obedience, and in no way fostered originality. But nowadays women are expected to think and act for themselves, and this independence and self-reliance may prove to be the generating spark which will rouse to activity the originality and creative power which, for all we know to the contrary, may long lain dormant within them.

In any case this want of creative faculty would not make a woman architect. Architecture is a logical art, and change has taken place in it without a very obvious reason, when no reason can be adduced for original and ingenious designs, such productions are grotesque and not architectural. The truest architects are not distinguished for originality of invention so much as for careful attention bestowed on the smallest details of their work, and women, "as a rule," possess the faculty of worrying out details so small that they often are apt to escape the attention of the more comprehensive mind of men.

I do not stop now you may go away with the impression that I consider women more fitted to practise architecture than men and nothing could be further from my thoughts. May I, concluding, repeat what I said at the beginning of my paper, it is not a question of men *versus* women, but that it is simply a case of the capacity of the individual?

ARNOLD MITCHELL, in proposing a vote of thanks, said Miss Charles had so ably presented her case that she deserved criticism. The burning problem in the practice of architecture by women was the limitations of sex. Up to a certain point the man had no better capacity than the woman in following such a profession. In dealing with contractors, a man was likely to find difficulties. The speaker thought the work would afford scope for women architects, but he thought that they would find little success.

LEONARD STOKES seconded the vote, and said many difficulties beset the path of the lady architect. The discussion which followed offered poor encouragement to the lady architect, if in her ambition she hoped for more office work and interior planning.

## ARCHITECTURAL DESIGN IN FRANCE.\*

HOW do we manage matters in France? I will tell you how a Frenchman sees it, although I may speak of much well known to many. The ideal architect, now as ever, should be both the scholar and artist. He should possess very varied knowledge. He should know the theory of all arts and all sciences which have anything to do with architecture. With this he should combine taste, the fine judgment and the genius of his art. Knowledge of history, of literature, geometry, mechanics, perspective and physics is necessary. But something which is absolutely indispensable is a thorough knowledge of design, for, after all, the entire art of the architect manifests itself in design.

When an architect is consulted with regard to a work of architecture, he should be able on the spot to design mentally one or even several projects of the structure in question, in accordance with the intentions of the person who wishes to build. This mental design makes it possible for him to propose at once to the owner one or several types of structure for the proposed building. When the first general understanding has been arrived at, the architect makes a sketch, a rough tracing with the pen, indicating only the ensemble and the principal divisions, serving as a basis for the execution of the real design or the final project. The architect should be able with his sketch to give an approximate estimate of the expense, based on the cost price per metre (or foot) of surface and per floor for a structure of the character ordered.

When client and architect agree on the ensemble of the structure and its essential points, the architect starts on the execution of his project. He first draws his design with pencil and on a reduced scale. The simplest and most commonly used scale is one decimetre or two decimetres, on which one or several of the divisions as units of length are taken. If it is understood that 1 centimetre, 2 centimetres, 5 centimetres represent 1 metre measured on the ground, we say that the design executed is on the scale of 0m,01, of 0m,02, of 0m,005 per metre. The custom in France is to draw the plans at 2 centimetres per metre. The design, first executed with pencil, as we said above, is drawn in ink with ruler and pen, following the lines traced with pencil, which after this second operation are erased. The interrupted lines (— — — — —) represent axes, as e.g. the axes of the walls; the dotted lines (.....) indicate the concealed lines and outlines. The connecting lines for the sides are likewise dotted; but on the plans painted with indian ink they are often entered with red ink.

To express the design the architect must represent in form of a plan, a profile and an elevation, the building which is to be erected.

The plan gives the fundamental conception of the building. It is, in fact, on the composition of this plan that the first merit of a work of architecture depends; the usefulness, I mean, of the building modelled upon the needs and convenience of its inhabitants. The skill of the architect consists in combining the convenience of the interior connections, of the necessary exits, with a regularity which is always desirable; but to this regularity, to symmetry, to the uniform correspondence between all the parts of a plan he must not sacrifice everything else; above all it is necessary that the general and special arrangement agrees with the needs and the use of the building. The composition of the plan of a building requires also the choice of the general idea, on which the form of the building, its special physiognomy, its character must depend. The elevation depends also on the plan. If the latter is simple, the structure overground will at once show a certain stamp of simplicity.

If the plan in the design of a building must above all correspond to and satisfy the idea of convenience, we may on the other hand say that the elevation alone is directly responsible for its beauty. To express this the architect makes use of geometrical and perspective drawings.

When the architect has designed the building to be erected in plan, in profile and in elevation, he has to proceed to the representation of the secondary parts of the architectural ensemble, to the representation of the various ornaments which are to form the decoration of the building. These details, these portions of the architectural arrangement, must be represented either on a large scale or full size, so that their different parts may be clearly understood. Together with these different designs, the architect must furnish estimates and specifications. The part embracing the statement of the work is called "devis descriptif," the part concerning the cost of each detail of work is the "devis estimatif." The "devis" must show in a precise manner the projected building, in its ensemble and its parts; it must give the conditions, requirements and processes best fitted to insure a perfect execution; indicate the nature of the materials to be used, the quality of these materials, the troubles

\* From a paper by M. Alb. Allain in the *Architectural Record* of New York.

which the same may cause and which must be avoided. Of course the forms and dimensions of the rooms, their arrangement and ornamentation are exactly fixed by the designs representing the plans, profiles, elevations and the details on large scale, which form the ensemble of the project. Nevertheless, the architect will describe in his "devis" the arrangement, the decoration of each of these parts. A methodical classification is necessary in the making up of a "devis," so as to avoid the confusion which may result from the great quantity of subjects treated. We usually allow for the subject matters a certain number of principal divisions, with headings as follows:—Earthwork and excavation, foundations, masonry, carpentry, roofing, joiners' work, glaziers' work. Under each of these chapters we bring together the material, workmanship, transportation, &c., for each class of work. In spite of all attention paid to the drawing up of a "devis" in the description of the work as well as in the estimate of prices, certain errors may be committed, which will cause a variation in the amount agreed upon for the finished work; on the other side, the owner may require some changes in the course of the execution. To avoid this, in order not to be bound irrevocably, we often suppress the "devis estimatif" and retain only the "devis descriptif" after the owner and the builder are sufficiently posted regarding the cost. On the whole, in France, the work of the architect consists in furnishing the project, involving a more or less large number of designs, and the "devis." Having done so, he is responsible only for damage caused by some faulty design or specification of his.

We said above that on the composition of the plan must depend not only the form of the building, but also its special physiognomy—its character. The architect must therefore apply to the composition of the plan all his science, all his intelligence and all his talent. Of course an ideal architect would have to invent this plan, take it entirely from his own brains. Such an ideal architect would not have recourse to any work; he would even avoid thinking of a plan previously executed, because that could only interfere with his creative ideas, or at least influence them. But besides possessing very extraordinary knowledge, such an architect would have to be a man of remarkable genius. In France—as, no doubt, elsewhere—architects of genius are rare. Some have thought they were, and—were much mistaken. The greater part of those who have relied chiefly on their own imagination only did something beyond their power, and failed. As a general rule, therefore, a sensible and prudent architect will take care not to try to invent too much. No doubt it will not be necessary for him, if he knows his business well (I say "well"), to have recourse to books on architecture; that is if he knows by heart the characteristic work of his predecessors, the common points where all masters have met, the best relations between given forms, the proportions best fitted to the special character of every sort of arrangement, the details of ornament agreed upon by the most celebrated artists. No, I repeat it, a good architect need not consult any work on architecture, because, no matter what problem may be before him, he will at once see in his mind's eye a standard plan of this building. I mean to say the disposition and the distribution proper for this building, the best order and the best arrangement so far given to such and such details and to its ensemble. If by chance the architect should not have the standard plan in question present in his mind, he should, of course, be advised to look it up either in technical books or in the works of his fellow-architects. I may say that there are standard plans for all kinds of structures, from the standard plan of the labourer's dwelling to the standard plan of the church, from the standard plan of the theatre to the standard plan of the hospital, and we may lay it down as a principle that the architect, before composing the plan of his building, must know the standard plan of that kind of building, and must not let it pass out of sight—unless he is a man of genius. Of course he must not copy it; that would be too simple; besides, it might be that the standard plan would not answer sufficiently well the particular taste and wishes of his client. What is necessary is that the architect, although inspired by the standard plan in its essential lines, should follow the general ideas of his client, and add to the work yet ideas of his own. The amount of the latter will be greater or less, according to the kind and importance of the work, and also according to the power of his originality. In one word, there must be in the mind of the architect a sort of mysterious collaboration between the architect's own conceptions, the requirements of his customer and the standard plan. From this triple collaboration the composition of the plan of the building in question will originate.

In France we design usually first the plan of the ground floor and that of the second floor, then the plans of the other floors, last of all the plans of the basement and of the upper part of the building. Thereafter we execute usually two sections of the structure, the longitudinal section and the transverse section. Finally, we design the elevation of the front of the building. In this last composition the taste, the intelligence and the rhythmical sense of the architect find occasion

to manifest themselves. But in these matters one must care not to yield too much to fancy. Trying to be original one may so easily become bizarre; excess in ornamentation almost always worse than excess in soberness. Many of French architects are skilful decorators. Some, tempted to show what they can do, exaggerate the importance of ornament. A detail becomes too pretentious. People of shudder. How many new buildings are there whose front overloaded with incongruous motives. Within a few metres height, these intemperate architects have piled every imaginable in order to produce the useless. We see only without motive, senseless balconies one above another, columns on the balconies, brackets suspended anywhere. It looks as if the ornaments had broken loose from architecture. And it must be observed, it has taken much talent to get it to look so. Taken singly, some of these motives are meritorious. The trouble is that they do not harmonise with the ensemble of the building, they do not even harmonise with themselves. Of course, we have to decorate the façade. Ornament is a complement of architecture, a necessary complement; ornament gives to the general design its brilliancy and character. The ornament of a building, no matter of what nature, of what importance, must not be the work of caprice; it must justify itself by declaring something of how the building is constructed, where its points of support, its anchorages, its chief floor, &c., are. The ancient architects made good use of these elements. There lies the origin of the columns, the buttresses, simple and composite mouldings, dentils and modillions of the cornice, the lions' heads and stones, the acroteria of the roof, the railings and friezes of the façade, the corbelling-out brackets, the gargoyles of the terraces and the caryatids of the porticoes. All these motives have their reason in the structure of the building. At all epochs the ornament, in obedience to the same laws of propriety and truth, proclaims on the outside the use, the destination of the building. A good architect will not lose sight of these eternal laws. Nor will he forget them when designing the divers ornaments which are to embellish the interior of the building. In France, of all these parts, as well as of all of the outside decoration, the architect furnishes a standard design either on a large scale or in full size. Whether the designs are washed with india ink or drawn is of no consequence.

A good architect can, of course, execute, arrange, design all kinds of private or public buildings. As a matter of course, however, a good architect, a celebrated designer, will not waste his talent and his time to the construction of buildings of no architectural importance and of quite elementary execution. We have in France, therefore, two categories of architects: those which busy themselves with humble, ordinary constructions, and those who devote themselves to the most important works.

### SCOTTISH MONUMENTS.

AT the last monthly meeting of the Society of Antiquaries of Scotland, Dr. D. Christison, secretary, read an interesting paper, copiously illustrated by lantern views, on the carvings and inscriptions on the kirkyard monuments of the Scottish Lowlands, which have hitherto attracted little attention. The beauty and antiquity of the monuments of the Western Highlands had secured for them an ample share of notice, illustrated with unsurpassable artistic merit and accuracy of work by James Drummond, but the Lowland kirkyards, with their more modern monuments and comparatively run-of-the-mill designs, had been almost ignored by the artist-antiquary alike, and had it not been for a praiseworthy paper on the mural monuments of Crail by Mr. E. Beveridge, and incidental revelations in Mr. Rae's edition of Donald's heraldic papers, we should be quite ignorant of the character and appearance of the monuments of the post-Reformation period. The epitaphs and inscriptions upon them, however, had been dealt with in local magazines and more extensively for the north-eastern counties by the late Andrew Jervise. The present paper gave the results of investigations during the summers of the last six years, chiefly in the districts of Perth, Fife, Angus and Mearns, the chief object was to display the designs carved on the monuments, but the inscriptions were not neglected. Dealing with the earlier examples prior to the end of the sixteenth century, he instanced one with a black letter inscription at Kilmadock, Perthshire. At St. Mary, Hawick, is a recumbent slab to John Deinis, who came to his death "in debaich" in 1546, and the only other sixteenth-century tombstone he had met with was at Foulden, Berwickshire, dated 1592, and bearing a quaint inscription in verse to the memory of George Ramsay, of Foulden Castle. The monuments of the seventeenth and eighteenth centuries in the selected churchyards of Kilmadock (Perthshire), Logie (Forfarshire), Laurencekirk (Kincardineshire), Abercorn

man), Anstruther and Ceres (Fifeshire), were passed in view to show the varieties of monuments in different districts. They resolved themselves into three classes, recumbent slabs, erect headstones or mural monuments, the recumbent class again dividing itself into the varieties of simple slabs, table-stones and roof-shaped stones. Characteristic examples of each class were described, and attention called to curious symbolism which they so often exhibited, tending only to warn or threaten the sinner by the view of the terms of mortality, the hour-glass, angels blowing trumpets announce the Resurrection and the Last Judgment, and many quaintly-rendered allusions to the shortness of life and the certainty of death. Another kind of symbolism was extensively applied in the tools carved on the gravestones of men of various handicrafts. With regard to the art of these sculptures, considerable dignity was sometimes given to the heads of the figures, and failure was most manifest in the bodies and faces. But the ornamental carvings were often in good taste, the general effect was pleasing. The inscriptions were skillfully worked into the design, occasionally forming the chief part of it, and the lettering was well done, though sometimes unequal. It was remarkable, however, that little of decorative carving had been derived from the beautiful forms of the early Christian monuments, and Mediaeval sculpture came mainly from the domain of heraldry. The church, the Church and the graveyard supplied the scenes. The monuments were local in style, each district having its own peculiarities. Comparing the Lowlands with the Western Highlands, the absence of all warlike weapons on the tombs was in strong contrast to the Highland usage as late as towards the end of the seventeenth century. Compared with England, the range of subjects was much wider and the symbolism more varied, but perhaps the most remarkable difference between the two countries was the apparently much earlier beginning of the post-Reformation tombstones in Scotland, the chief cause of their earlier origin and richer development in the country being attributable to the powerful impulse of the Reformation in the northern kingdom, while the superior character of the inscriptions, especially in Latin, was due to the parish school system. In conclusion, he commended the investigation of these monuments to local observers as throwing light on the history and social condition of the country during two centuries or more, of which the memorials would undoubtedly be lost if not speedily recorded.

#### SYMMETRICAL BUILDINGS IN PAINTINGS.

It has been said by Gilpin that if we introduce a piece of regular architecture into a picture without any of the disarrangements occasioned by accident or decay, "it immediately becomes a formal object and ceases to please." That is either an erroneous or a very imperfectly expressed idea. Most undoubtedly, if it be shown merely in elevation, a structure which is symmetrical will produce a formal appearance, but there is no occasion for its being so exhibited; on the contrary, by means of judicious foreshortening or perspective, shadows thrown upon it so as to break up the too great unity of its masses, and by means of figures and other elements, it may be made to present an agreeable species of familiarity to the eye, at the same time that it suggests to the mind the idea of the most perfect symmetry. If for instance we view a colonnade in front or parallel to the picture, it will undoubtedly be formal and monotonous, but if it is shown obliquely and from a near station so as to be considerably foreshortened, though we still perceive that it is precisely the same as before, the columns all equidistant and equal in height, the representation is produced by unequal spaces and unequal heights; the horizontal lines vanish obliquely, the upper parts are diminished, and many are partially concealed and indicated only by those which are shown; besides which the whole may be so broken by shadows falling upon the columns, that the contrast of the masses of light and shade is sufficient to remove whatever monotony might else exist. Therefore, although the term picturesque is applied by way of distinction to that class of objects which are well suited for painting, but possess qualities more or less disagreeable in themselves, and so far implies something distinct from if not directly opposed to beauty, it comprehends also another class which, while they are beautiful in themselves, are well adapted to pictorial representation, inasmuch as, in order to produce their images upon canvas, there must be contrasts and irregularities both in respect to form and colour. Surfaces perfectly smooth and of uniform colour in themselves, such as those of highly polished marble or metal, may be expressed by a variety of colours and by sudden lights and shadows, perfect regularity of form, by a distorted image of the object according to the laws of perspective; while the true hue of local colouring is variously modified, according to position and distance of the object, by aerial perspective and by light and shadow and reflected light; and in

proportion as they afford scope for displaying the effects of both linear and aerial perspective, and the contrasts and changes of form and colour arising from them, will objects partake of the picturesque.

#### THE LEIGHTON MEMORIAL, ST. PAUL'S.

ON Wednesday the memorial of the late Lord Leighton was unveiled by Sir E. J. Poynter, P.R.A. It is in the form of a sarcophagus bearing a recumbent figure of the late artist. There are also figures of Painting and Sculpture. The following inscription is on the sarcophagus:—"To the memory of Frederic Lord Leighton of Stretton, painter and sculptor, seventh President of the Royal Academy of Arts, this monument is erected by his many friends and admirers. Born December 3, 1830; died January 25, 1896. He lies buried in the crypt of this cathedral." After prayer by the clergy, the following address was delivered by Sir E. J. Poynter:—

I am permitted by the Dean to say a few words in memory of the great artist and beloved President of our Royal Academy, on the occasion of uncovering for the first time the beautiful monument which the enthusiasm of his friends and admirers has erected to his memory. That the monument has taken so important a form as you will presently see is due greatly to the interest which His Majesty the King took in the project from the very first. Entering most warmly into the movement, His Majesty—at that time Prince of Wales—with a generous appreciation of the great qualities and character of Lord Leighton, took upon himself the presidency of the committee for promoting a memorial and deciding what form it should take; and by a liberal contribution in money with which he headed the subscriptions at the first meeting, held at Marlborough House, set an example which was eagerly followed, with the result that it became possible to dignify our President's memory with a work of art adequate in scale, and in other respects worthy of so great an artist and so distinguished a man. I am commanded by His Majesty to give expression to the interest with which he has watched the progress of the work and now views the fulfilment of the task, which, as President of the committee, he inaugurated out of his high regard for one whose talents he held in such high esteem, and for whom personally he had a warm affection. It is in His Majesty's name that I now unveil this lasting memorial to Lord Leighton's fame.

The President continued:—We are happy to think—for I am sure that everyone present will agree with me—that the monument which you now see before you, and which by permission of the Dean and Chapter occupies this important position, is one which cannot but add a lustre to the memory of the illustrious artist whom it commemorates. It will stand for all time in this glorious cathedral as worthy of its surroundings, and as a proud example of what English art can achieve. Mr. Brock, to whose genius this consummate work is due, was intimately associated with Lord Leighton, and his work has been a work of love. Besides affording a lasting source of pleasure and admiration as a production of the finest art, it presents to the world a record of the man in a portrait which, I may venture to say, has never been surpassed for vivid resemblance, for beauty of expression and for tenderness of feeling. Mr. Brock has spared neither time, trouble nor cost to perfect the work beyond what was provided for by the limits of the fund subscribed, and I think it would be found—if the truth could be known—that in his disinterested desire to honour his departed friend, Mr. Brock has been the largest contributor of all. All who are here present know that it is upon no ordinary man that, for this brief moment which we are able to snatch from the duties and cares and distractions of this tumultuous city, our attention is concentrated.

I remember that even in the very beginning of his career, at the time when I first knew him in Rome, when he was only twenty-three years old, and was beginning that picture of Cimabue by which he sprang at once into fame, we used to call him the "admirable Crichton" from the variety of his accomplishments and the perfection to which he brought everything which he undertook. Young, handsome and fair, full of life and energy, with a buoyancy of spirits that I never saw equalled, he seemed born for a life of enjoyment, and his brilliant artistic gifts shone out as only a part of the general exuberance of his nature. But underneath his joyous lightheartedness lay a passionate love of his art, with a depth of perseverance and patient determination to excel and to attain to the highest mastery in its practice, which was the ballast for his soaring aspirations. And this was the more remarkable because the usual stimulus of necessity was wanting. He had means which would have enabled him to live a life of ease, in which his art might have taken a secondary place, as merely one out of many brilliant accomplishments. The advantage was one which might have paralysed serious endeavour in a nature

less bent on excellence. He had, moreover, the wisdom to wait until years of assiduous study had made him sure of his method, so that it was as no crude beginner in haste to display his talent, but as an accomplished artist, that he took the world by surprise when, a youth of 25, he exhibited that first great work which was as successful as it was ambitious in aim, and which was brought into special prominence by being bought by Her Majesty Queen Victoria. I was in the happy position to witness the beginning and progress of this work, for with that generosity to beginners for which he was conspicuous through his whole life he invited me to his studio, allowed me to spend day after day with him drawing from his models and watching his method of work, an invaluable and never-forgotten guidance and example to me for all my life. This was but the first instance of that inexhaustible kindness which he never failed to show to all young students who went to him for advice and assistance in their studies, and which can be attested by many who have since made a name for themselves.

It would be impossible in the short time which I have at my disposal to convey to those who did not know him any adequate idea of Lord Leighton's many-sided nature or achievements. I only touch on his love for the kindred art of music, because he made it the source of so much pleasure to his friends. His gift of languages was celebrated; he spoke most European languages as freely as his own, and in his own he was an acknowledged master. In his public speeches especially he entranced everyone by the purity and elevation of his diction and the easy flow of his style. Cosmopolitan as he was, however, by his education and early surroundings, and his wonderful linguistic attainments which made him everywhere at home, if he had a passion which rivalled that of his art, it was the love of his own country and his high ideal of the duties of a citizen. It is well known to many how he threw himself into the Volunteer movement at its inception, and was with others a leading cause of its success, and how to the efficiency of the corps which he was mainly instrumental in forming he devoted himself with an ardour as great as if it had been the business of his life. In all these matters his brilliant natural gifts and ambition to excel were no doubt an advantage which he possessed beyond the ordinary; but it is not to be supposed that to those qualities alone was due the exceptional position to which he attained. I do not know that Leighton loved pleasure less or work more than most men; but he had as a guiding principle from the beginning to the end of his illustrious career a fixed determination to do to the utmost what he conceived to be his duty, which, as he conceived it, lay in the honest fulfilment of a thousand obligations beyond what the exercise of his art laid upon him in the first place. No care for self, no thought of either pleasure or gain ever disturbed him from his high ideal; indeed, in the conception of his duties he was chivalrous almost to excess, and would freely give for public objects, and for the glory and advancement of his art and of his beloved Academy, time and work for which he might with propriety have been liberally compensated. He was indeed generous and liberal to an extent that made serious inroads upon his income, and cases of individual distress found him always open-handed to public demands. No one will ever know how largely and freely he gave privately of his means, and crowded as his life was beyond that of most busy men, he always found time to listen to a friend, to help a beginner, or to relieve affliction. I may cite, as merely one example of his public spirit and generosity in these respects, the beautiful monument close to which we now stand. In his desire to do justice to the great work of Alfred Stevens and to the hero whom it commemorates, he guaranteed the cost of its removal from the obscure place where it was first erected to its originally destined position under the arch of this nave, and the sum required falling far short of the subscriptions given, he defrayed it from his own purse.

Gifts and qualities such as these pointed long beforehand to the place which he must ultimately occupy, and when the time came it was by the unanimous vote of his colleagues that he was chosen President of the Royal Academy, in which capacity he was best known in his later years. The brilliancy and energy of his career in that responsible position are within the memory of all. If he was successful in raising the Royal Academy to a higher place in the estimation of the public than it had ever occupied, it was because in his mind the interests of the Academy and the interests of the highest art were identical, and because he illustrated this view in his own person by his own devoted and noble example, and by his exalted aims in the practice of his own art.

To what perfection of accomplishment, of beauty of form and colour, of lofty design and exquisiteness of rendering this practice had attained, no one, I believe, had a full idea until, after his death, his life's work was united in one collection on the walls which he had so continuously adorned. It came, I know, as a surprise to me, who had had the advantage of following his career from the first touch which I saw put on his first picture to the last work which he left in glorious incom-

pleteness—that picture of Clytie, where the flame of the sun seems symbolic of his own departing career. Constant incessant energy such as his, if it brought a splendid reward, the esteem and admiration of his colleagues, his friends the public, brought with it also its sacrifice, for no one can doubt that his life was shortened by the excess of energy, and his determination to abate nothing of the pride of his art in face of the hundred other occupations which the position of President entailed. He died, if one may say so, in the plenitude of his health and vigour, working with more than his normal brilliancy to the last moment when the spasm which brought on the end. Those who witnessed the longed and painful struggles of that end say that his courage and his sweetness and his cheerfulness never deserted. He was as unselfish in his death as always throughout the course of his life. In Lord Leighton's memory I commit his work to the charge of the Dean and Chapter of this cathedral.

## TESSERÆ.

### St. Mark's, Venice, in the Seventeenth Century

**D**URING the Civil War in England John Evelyn went abroad in order to study science and art. He wrote much about architecture, and the following is his account of St. Mark's:—"Being come into the church you see nothing and tread on nothing but what is precious. The floor is inlaid with agates, lazulis, calcedons, jaspers, porphyries, other rich marbles, admirable also for the work; the walls are sumptuously encrusted and presenting to the imagination the shapes of men, birds, houses, flowers and a thousand varieties. The roof is of most excellent mosaic. But what most people admire is the new work of the emblematic tree at the entrance passage out of the church. In the midst of this rich vault are five cupolas, the middle very large, and sustained by three marble columns, eight of which are of precious marble. Under these cupolas is the high altar, on which is a reliquary of several sorts of jewels engraven with figures after the manner of the ancients, and set together with plates of pure gold. The altar is covered with a canopy of ophir, on which is sculpture the story of the Bible, and so on the pillars, which are of Egyptian marble, that support it. Behind these are four other columns of transparent and true Oriental alabaster, brought hither from the ruins of Solomon's temple as they report."

### The Sardinian Nuraghi.

The Nuraghi are attributed by some to Iberian colonists and their leader Norax. They are a kind of tower in the shape of a truncated cone, constructed of large blocks of stone, porphyry or freestone, without cement, and forming two concentric walls, between which are stairs leading to the summit. The inner part has generally two vaulted rooms, one above the other. The entrance at the base is very low, and is reached through both walls to the lower chamber. The stairs lead to the upper chamber. The Nuraghi are of two kinds, the most common, and probably the most ancient, being marked by the chisel, and are constructed of massive blocks of irregular faces, and smaller stones in the interstices. The exterior materials of the others are evidently worked by the hand, and though the stones are not exactly square, they are laid in horizontal layers, and gradually diminish in size towards the summit. The Nuraghi stand generally on the summit of a hill, commanding a view of the plains. Some rest upon a solid, spacious substructure or platform walled round in the same manner, and in which are constructed hidden chambers, communicating with the central one by a covered gallery. Captain Smyth gives the plan and section of one of these, which is in the plain of Giavesu, near Bonorva. It is 40 feet high, including the substructure, and the cone is 40 feet in diameter where it rises above the substructure. One of the loftiest Nuraghi is between Samagheu and Fordungiu, in the district of Busachi, east of Oristano; it is nearly 100 feet high, and is called by the natives "Su Nuraghi." Nuraghi are scattered all over Sardinia to the number of several hundred, and are seen in every state, some perfect, others a heap of rubbish. They are very numerous in the district of Sulcis, or the south-west part of the island, also in the hilly region of Le Marghine, north of Oristano. There are also fine specimens of them in the Campo d'oro, and at Isili and Gennuri in the Campidano. The original purpose of these buildings was probably for watch and defence, though in after ages some of them may have been used as monuments for the dead, fragments of Roman terra-cotta coins of the Empire having been found in them. No literal nor symbolical characters are discovered in these singular structures.

### The Bridge of Augustus at Narni.

The attention of the tourist who visits Narni is first directed to the remains of an ancient Roman bridge which crosses the river Nar on the approach to the town from the south of Terni. This bridge was one of the four which Augustus

ered to be built on the Flaminian road. The first was ns Milvia, over the Tiber, about a mile and a half from me; the second, over the same river, near Otriculum; the d, of which we now speak, at Narni; and the fourth was cted over the Marecchia, near Rimini, which joins the minian and Æmilian roads. The bridge at Narni had four hes, and Procopius, in the first book of his history of the hic war, says they were the highest arches he had ever a. One only now remains to attest its former magnificence, if we may judge the largest from the distance of the piers, must have been of considerable breadth. The stones of ch it is built are of surprising thickness; they are joined ether without cement or cramps, and from their extreme dity might have defied the attacks of time had not the adation of one of the centre piles given way, which ttered the whole fabric. It is the Bridge of Augustus hich the poet Martial speaks in one of his epigrams, in ch he thus addresses the city of Narni:—"Preserve my er part and spare my friend, so, Narni, may thy bridge for e stand." It is now, however, notwithstanding the good es of the poet, dwindled into a mere object of research to curious traveller.

#### Balusters.

Balusters (which Italian artists invented) are obviously iature columns, but not copied from columns. No, they truly imitated, modified to their less structural, more deco- ve station by a sacrifice, of structural to decorative fitness, of statical to mere formal beauty. Statical beauty is most developed in the Doric column, but mere eumorphy ined its perfection in the ancient vases. Take a column a vase reduced to the same height and drawn on the same line, and draw a third outline whose ordinates shall ywhere be a mean between those of the column and the r, there will be obtained a form fit for a baluster. The aster (the most successful novelty ever introduced by the lerns), if not an invention of genius, was at least one of ed taste. It fell, however, before the popular English ion of lightness. Those who think a building is rendered t by the omission or utmost possible reduction of eaves and r projections (*i.e.* by giving it as much as possible the arance of a solid block) think, of course, that the e stride is heavier than a massive solid dado (taken from foot of a building to be placed on the top), and looks ier than a row of square sticks, in which the opposite ities of flimsy substance and the severest gravity of form ource neutralise each other, and produce sheer negation rt by themselves; but in a composition, positive ugliness, ive anti-art, which is indeed what lightness generally as with us.

#### John Smibert.

This painter was born in Edinburgh about 1684, and ed his time with a house painter; but eager to handle a il in a more elevated style he came to London, where, ever, for subsistence he was forced to content himself at r with working for coach painters. It was a little rise to be oyled in copying for dealers, and from thence he obtained itance into the Academy, which was directed by Sir James nhill. His efforts and ardour at last carried him to Italy, e he spent three years in copying portraits of Titian, yke and Rubens, and improved enough to meet with much iveness at his return in Edinburgh and London. When his try and abilities had thus surmounted the asperities of his ne, he was tempted against the persuasion of his friends n bark in the uncertain but philanthropic scheme of the us Dean Berkeley, afterwards Bishop of Cloyne, whose evolent heart was then warmly set on the erection of a nrsal college of science and arts in Bermuda for the in- ition of heathen children in Christian duties and civil vledge. Smibert, a silent and modest man, who abhorred inesse of some of his profession, was enchanted with a plan he thought promised him tranquillity and honest subsist- n in a healthful elysian climate, and in spite of remon- ces engaged with the dean, whose zeal had ranged the favour e court on his side. The king's death dispelled the vision. nvert, however, who had set sail, found it convenient or had esitation enough to proceed, but settled at Boston in New and, where he succeeded to his wish, and married a lady a considerable fortune. He died in 1751. John Smibert ed much influence among American artists.

#### Ancient Ladders.

he general construction and use of ladders was the same ng the ancients as in modern times, and therefore requires o explanation, with the exception of those used in besieging a ored place and in making an assault upon it. The ladders e erected against the walls, and the besiegers ascended e under showers of darts and stones thrown upon them by e besieged. Some of these ladders were formed like our on ones; others consisted of several parts which might

be put together so as to form one large ladder, and were taken to pieces when they were not used. Sometimes also they were made of ropes or leather with large iron hooks at the top, by which they were fastened to the walls to be ascended. The ladders made wholly of leather consisted of tubes sewed up air-tight, and when they were wanted these tubes were filled with air. Heron also mentions a ladder which was constructed in such a manner that it might be erected with a man standing on the top, whose object was to observe what was going on in the besieged town. Others, again, were provided at the top with a small bridge, which might be let down upon the wall. In ships small ladders or steps were likewise used for the purpose of ascending into or descending from them. In the houses of the Romans the name "*scalæ*" was applied to the stairs or staircase leading from the lower to the upper parts of a house. The steps were either of wood or stone, and, as in modern times, fixed on one side in the wall. It appears that the staircases in Roman houses were as dark as those of old houses in modern times, for it is very often mentioned that a person concealed himself "*in scalis*" or "*in scalarum tenebris*," and passages like these need not be interpreted, as some commentators have done, by the supposition that "*in scalis*" is the same as "*sub scalis*." The Roman houses had two kinds of staircases: the one were the common "*scalæ*," which were open on one side; the others were called "*scalæ Græcæ*," which were closed on both sides. The Flaminica was not allowed to ascend higher than three steps on a common scala, but that she might make use of a climax like every other person, as here she was concealed when going up.

#### Attacks on Wren.

Censure is a tax which all distinguished men must pay for their eminence, and Wren escaped not its penalties. One mode of attack was through there being a clause in an Act of Parliament which suspended a moiety of the architect's salary at St. Paul's till the building was finished. Some of the new and younger commissioners, who knew not Wren nor his services, obstructed to the utmost of their power all his measures for completing the fabric. Wren therefore petitioned the Queen to interpose her royal authority so that he might be suffered to finish the cathedral in such manner as Her Majesty should please to direct. The Queen commanded this petition to be delivered by the Duke of Shrewsbury, the Lord Chamberlain, to the commissioners, who replied in a long series of excuses, denials and accusations against under workmen, artificers, &c., which did not inculpate the architect in any way. To this document Wren replied by a pamphlet and an address to the Archbishop of Canterbury and the Bishop of London, the chief commissioners for the building. In the latter he recites the clauses relative to the coal duty and its application, and that which related to the detention of half his salary till the works were completed. By this latter clause he conceived it to imply that the building and everything connected therewith was under his management and direction, and that it was in his power to hasten or retard it; both of which he appealed to them as knowing the contrary, and to what extent he had been limited and confined. However, it had pleased God so to bless his sincere endeavours, that he had brought the building to a conclusion, so far as was in his power; he thought nothing could be said to remain unperfected but the iron fence round the church and painting the cupola, the directing of which had been taken from him. He therefore hoped that he was neither answerable for them, nor that the suspending clause could or ought to affect him any further on that account, and prayed that it be so considered and the balance paid to him. This representation was referred to the Attorney-General, who gave his opinion that he considered Sir Christopher Wren's case to be very hard, inasmuch as the stopping half his salary, being intended to encourage him to use his utmost diligence to finish the cathedral, which for all that appeared he had done, and the not finishing it was not his fault, but that of others. But if the church remained unfinished the commissioners had no alternative, but in justice should determine the manner of doing it, that the charge of an architect might be saved and Sir Christopher receive the balance of his salary. The opinion of the Attorney-General being inconclusive, and the architectural part of the cathedral being completed, Wren petitioned the House of Commons to the same effect, whereupon the House considered his case, and were so well satisfied with its justice as to declare the cathedral to be finished, so far as was required to be done by Sir Christopher Wren as surveyor-general, and ordered that the suspended salary be paid to him on or before December 25, 1711.

#### The Portland Vase.

This vase was said by Montfaucon to be formed of a precious stone; but subsequent examination has shown the material to be dark blue glass, relieved by figures and devices in white enamel. It is about ten inches in height and beautifully curved from the top downwards, the diameter at the top being about three inches and a half, at the neck or smallest

part two inches, at the largest part (mid-height) seven inches and at the bottom five inches, with two handles, one on each side. The blue tint of the glass is rich and beautiful, and is rendered still more so by the contrast of the delicate white enamel of which the figures are formed. These figures are seven in number, three men, three women and a winged cupid; but the story or scene represented has never been satisfactorily explained, although many attempts at explanation have been made. Dr. King endeavoured to show by a somewhat forced construction that the scene had a mythological relation to the birth and acts of the emperor Alexander Severus, and other theories of a similar kind have been advanced. The figures, however, whatever may be their import, are placed in the following order:—On entering the ante-room one of the handles is first seen, having beneath it a wild-looking head with long hair and beard; near the handle (to the right) is a male figure standing under a kind of porch and offering his extended arm to a female seated on the ground, over whose head bends the branch of a tree; a winged boy is hovering over these two figures, and to the right is a man leaning his elbow in an easy attitude on his knee, the foot being raised on a stone and his chin resting on his hand. We then come to the second handle, which has a head under it similar to that on the opposite side; near this handle is a man seated on a stone and looking at a female figure reclining in an easy and elegant attitude, with an inverted torch in her left hand and the right passing over her head; the branch of a tree bends over her, and at her left hand is another male figure, who is looking towards her and holding a staff in his left hand. These figures are about five inches in height and are modelled or moulded with minute accuracy. Being different in colour and in opacity from the glass on which they are laid, they must have been fashioned before being fixed on the vase; yet the union has been so complete that no joint can be seen between them, and the minute details of the figures have not been in the slightest degree injured by the heat which in all probability was necessary for the process of cementation. At the bottom of the vase is an enamelled head and bust of a figure whose hand is elevated towards the mouth, and who has a fine Grecian outline of face. Dr. King was of opinion that this head was part of a larger work, and was cemented on the vase by a process different from that employed on the other parts.

#### Music and Painting.

In the soulless oblivion produced by materialism we lose sight of the deepest beauties of every art. We call music "sensual and vague," and deny its powers of expression simply because it cannot give the form and colour of nature, forgetting that it has the higher faculty of reawakening the feelings produced by the sight of nature, whose mysterious spirit appeals to the soul through the ear even more than through the eye. There is no work in any art which shows such truth to nature, or is such a masterpiece of colouring as Beethoven's "Pastoral Symphony," producing by merely audible means those feelings, strong in youth but weakening with age, which overflow the heart in the presence of nature—when its living works seem to exhale in gratitude to their Creator, and in the restless though faint din around us we recognise sounds of joy, as if the flowers and the grass, in a tuneful breath of adoration, unbosomed their beauty to the morning light. The artist who composed a work which can thus act on the soul is not only a musician but also a poet, and even a painter, merely employing sound as a means to embody his ideas. So in painting, we feel at times as if there was sound as well as form, and that it appeals to the ear as to the eye, having more eloquence in its impassive silence than even music or poetry could impart.

#### GENERAL.

**Mr. Edwin O. Sachs** has taken into partnership Mr. G. Spencer Hoffman, M.A., and the firm will be known as "Edwin O. Sachs & Hoffman."

**The Death** is announced of Albert Bierstadt, the well-known landscape painter. Deceased, who was of German origin, was born in 1830 near Dusseldorf, but was taken by his parents to America a year later.

**The Lord Mayor of London** on Tuesday laid the foundation-stone of the building which is about to be erected in Old Bailey as a memorial of the jubilee of the United Kingdom Band of Hope Union. The building will contain seven floors, part of which will be let as offices. Mr. Rowland Plumbe is the architect.

**An Exhibition** of Austrian fine art and decorative furniture will be held in London during the coming season. The exhibition is being promoted by the Austrian Ministry of Commerce, and will embrace within its scope everything that is new, original or characteristic in Austrian decorative art. The chief feature of the exhibition will be a large number of intérieurs by the leading furniture firms of Vienna. The exhibi-

tion will be held at Prince's Skating Rink, Kensington, May 15 to July 31 inclusive.

**The State Apartments** at Windsor Castle are to be to the public on regular stated days as soon as they are prepared. If possible they will be open on Easter Holiday.

**Count Plunkett** gave a lecture last week on "Donatello" in the Dublin Museum. This was the first lecture on individual sculptor's works delivered in the Museum. He explained how Donatello advanced from realism to the expression of the noblest spirituality. From ancient art he showed his perfect technique, yet while most of his contemporaries under like conditions became mere imitators, Donatello remained audaciously original. Count Plunkett showed the influence he exercised not only over sculptors, but over painters as Botticelli, Mantegna and Raphael.

**The Church** of St. Bartholomew the Great, Smithfield, including the crypt, will be open without charge to visitors on March 8 and March 22, on the occasions of the usual historical and explanatory lectures.

**Mr. Griffith Thomas**, chairman of the Swansea Harbour Trust, laid the foundation-stone on Tuesday of the new headquarters, which are being constructed at the cost of 15,000*l.*

**The Governing Authorities** of Christ's Hospital are making preparations for the abandonment of the historic buildings in Newgate Street, and the removal to the new building at Horsham. The great hall has, so far as its interior decoration is concerned, been dismantled, and nothing remains but bare walls, the old organ having followed the pictures, ornaments and stained glass. The date of the boys' departure from Newgate Street has been fixed for April 19, and the reassembly on June 2 at Horsham, where also the boys' preparatory school at Hertford will henceforth be held, and educated, while the vacated buildings will be occupied by girls. The opening of the new school at Horsham will, it is hoped, be performed by royalty.

**Mr. John Cook**, borough engineer of Lancaster, has been appointed engineer for the city of Cape Town at a commensurate salary of 1,500*l.*

**The Old Church** adjoining Rockingham Castle, Northamptonshire, was damaged by fire on Sunday, owing to overheating of the flues.

**"Great John,"** the new bell at Beverley Minster, weighs 7 tons 3 qrs. 1 lb., was inaugurated on Saturday, a thankoffering by the vicar, Canon Nolloth, for twenty years of work in Beverley Minster and its parishes. The crown are the words, "Magna Campana vocor Johannis Evangelistæ; MDCCCCL.".

**Mr. J. Oldrid Scott** having been called in to examine the Selby Abbey tower, has confirmed the apprehensions that the tower has been entertained as to its safety, and recommended that the upper part should be taken down at once. It was unanimously resolved that Mr. Scott be requested to prepare a plan and obtain estimates of the cost of the proposed work.

**The Central League of School Art** of Toronto has decided to purchase five large pictures representative of different styles of architecture, together with a collection of architectural pictures, which will be circulated among the public schools of the city.

**The Scarborough Corporation** finally passed last night the amended plans for the new infectious diseases hospital, in accordance with the requirements of the Local Government Board, which is to be erected at a cost of 15,000*l.*

**Mr. Julius de Benczur** is painting a portrait of the Emperor of Austria which is to be presented to the Emperor Edward VII. on the occasion of the Coronation. The Emperor will be represented wearing the uniform of the English regiment.

**Mr. Rowland Berkeley** will read on Monday before the Surveyors' Institution a paper on "Electric Railway Street Compensations."

**The Town of Horsham** was on Wednesday illuminated by means of electricity at a cost of about 14,000*l.* The work has been carried out for the Urban Council. The architect is Messrs. Gordon & Gunton, and the consulting engineer is Mr. W. C. C. Hawtayne. Mr. W. J. Proctor has been appointed resident electrical engineer.

**Mr. A. Carnegie** has founded an annual prize of 500*l.* which will be awarded by the jury for the most meritorious oil-painting in the Exhibition of American Artists. The prize is for an American artist, portraits only excepted, the picture to be the property of the artist. The same artist may not receive the prize in two successive years, and not more than twice.

**Sir Philip Burne-Jones** has sailed for New York, which city he has received commissions for portraits.

**Messrs. J. F. Fogerty and W. Clifford Farne** have entered into partnership as architects, civil engineers and surveyors at Bournemouth, and will carry on the business of the late firms of Pinder & Fogerty and Pearce & Parnell.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**ALDRERSHOT.**—March 1.—Plans are invited for laying-out a pleasure ground about 6 acres of land in the centre of Aldershot. Mr. Nelson F. Dennis, A.M.I.C.E., surveyor.

**ALDRERSHOT.**—March 29.—Competitive plans are invited for proposed public offices, fire-station and town hall for the town. Premiums of £100, £75 and £50 will be awarded for first, second and third best plans. Mr. Nelson F. Dennis, A.M.I.C.E., surveyor.

**AUSTRALIA.**—May 1.—Designs are invited from sculptors for a memorial statue of Her late Majesty in marble or bronze. Information can be obtained at the office of the Agent-General for the State of Victoria, 15 Victoria Street, West Melbourne.

**DUNSTABLE.**—March 14.—Plans are invited, with estimate of expense, for a six-bed infectious diseases hospital to be erected near Dunstable. A premium of 5% offered for best selected. Mr. C. Crichton S. Benning, town clerk, Dunstable.

**HARROGATE.**—May 14.—Competitive designs are invited for a new town hall, the cost of which must not exceed 40,000*l.* Premiums of 150*l.*, 100*l.* and 75*l.* are offered for the three selected designs. Mr. F. Bagshaw, borough engineer, Municipal Offices, Harrogate.

**IRELAND.**—Feb. 26.—A premium of £20 is offered for the best and cheapest report, plans, specification and estimates, &c., for providing the town of Kanturk with a wholesome supply of water. Mr. Mt. Timothy Guiney, clerk to the Kanturk Rural District Council, at the Boardroom of the Workhouse.

**LANGHO.**—April 4.—Competitive drawings are invited for buildings to be erected at Langho, near Blackburn, for the accommodation of the epileptics, imbeciles and idiots at present in the workhouses of the Chorlton Union and the township of Manchester. Premiums of 200*l.*, 150*l.* and 100*l.* respectively will be awarded. Lithographed plan of site, and copy of conditions and instructions, may be obtained by a written application only, addressed to the Clerk to the Joint Asylum Committee, Chorlton Union Offices, All Saints, Manchester.

**LIVERPOOL.**—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

**NEW MALDEN.**—March 5.—Designs, &c., are invited for public offices, fire-station, cart sheds, stables and mortuary to be erected at New Malden, Surrey. Total cost of buildings not to exceed 5,100*l.* Premiums of 25*l.* and 10*l.* respectively are offered for the best and second best design. Mr. C. T. Lewis, clerk to The Maldens and Coombe Urban District Council, 7 Market Place, New Malden.

## CONTRACTS OPEN.

**ALDIN GRANGE.**—March 5.—For erection of a house for the stationmaster at Aldin Grange, for the North-Eastern Railway Co. Mr. William Bell, architect, the Central Station, Newcastle-on-Tyne.

**ANNITSFORD.**—Feb. 28.—For erection of a magazine for high explosives, and surrounding screen, near Annitsford station, Northumberland. Mr. L. H. Armour, 16 West Street, Gateshead.

**BARNSTAPLE.**—Feb. 25.—For erection of stabling at the Station hotel, Wooda Bay Messrs. Smyth-Richards & Fox, architects, 3 Castle Street, Barnstaple.

**BELPER.**—Feb. 26.—For erection of engine-house, foundation for engine and pumps, stone boundary fence walls, &c., at the Holloway, Crich and Park Head reservoirs. Mr. Joseph Pym, clerk to the Council, Belper.

**BIRKENHEAD.**—Feb. 24.—For construction of conveniences in the market hall. Mr. Charles Brownridge, borough surveyor, Town Hall, Birkenhead.

**BIRKENHEAD.**—Feb. 25.—For extension to the electric tramway car-shed in Laird Street. Mr. Charles Brownridge, borough surveyor, Town Hall, Birkenhead.

**BIRKENHEAD.**—Feb. 25.—For supplying and fixing machinery required in the tramways repair shop at the Laird Street depot. Mr. Alfred Gill, town clerk, Town Hall, Birkenhead.

**BRACEBRIDGE.**—March 3.—For alterations and additions to the present buildings of the Bracebridge Asylum, near Lincoln. Messrs. Giles, Gough & Trollope, architects, 28 Craven Street, Charing Cross, S.W.

THE third largest bell in Great Britain has just been hoisted into position in the south tower of Beverley Minster. It weighs over seven tons, and has a diameter of seven feet three inches. A bell of six tons was placed in the Minster in 1900, but had to be taken down, and has been recast in the new bell. The original great bell, which lasted for nearly two centuries, weighed only a little over one ton.

THE electricity department of the Huddersfield Corporation had an income during 1901 from the supply of the current of 19,024*l.*, an increase of 2,634*l.* over the previous year. The aggregate receipts exceeded the expenditure by 2,561*l.*, and a proposal to transfer this to the depreciation and contingencies account aroused considerable discussion at the meeting of the Town Council.

## TRADE NOTES.

ST. ANDREW'S CHURCH, Colyton, has lately been fitted with the well-known "Small Tube" hot-water heating apparatus Messrs. John King, Limited, engineers, Liverpool, employing their economical coil heater with waterway firebars.

THE directors of Messrs. John Oakey & Sons, Ltd., propose a final dividend upon the ordinary shares of 5 per cent. for the half-year ending December 31 last, together with a bonus of 2½ per cent., making 12 per cent. for the year.

MESSRS. WM. POTTS & SONS, clock manufacturers, Lee and Newcastle-on-Tyne, have a large illuminated turret-clock now in progress for the Post Office Savings Bank, Kensington, for H.M. Government, which is to be erected at an early date. They have also a large illuminated turret-clock with two dials for the City of London.

IN connection with the structural alterations and extensions just commencing by Messrs. Waring at Rushton Park, Rotherbridge, Sussex, for Mr. T. G. Ashton, M.P., Messrs. G. Jennings Ltd., have been entrusted by the architects, Messrs. Hesketh Stokes, with the new sanitary work, water-supply and heating arrangements, which are of considerable magnitude.

THE heating of Todwick Church, near Sheffield, has just been completed on the low-pressure hot-water system by Messrs. Alfred Grindrod & Co., heating and ventilating engineers, West Street, Sheffield. The same firm have also recently heated the Old Chapel at Fulwood, near Sheffield, by the latest improved high-pressure hot-water apparatus, and Victoria Buildings, Derby, for Mr. R. S. Elliott, they have installed both a high-pressure hot-water heating apparatus and also a low-pressure steam-heating apparatus.

## ELECTRIC NOTES.

EXPERIMENTS are being made in Salisbury with a view to test the comparative value for lighting purposes of electricity and the Welsbach self-intensifying gas burners.

LIEUTENANT-COLONEL A. C. SMITH held a Local Government Board inquiry at Elland last week into the application for sanction to borrow 16,000*l.* for purposes of electric lighting and the provision of a refuse destructor.

THE accounts for the year's working of the Worcester Corporation Electricity Works show a profit of 1,385*l.* 6*s.* 2

Length, Fourteen-Foot Seven Inches by Fifteen Inches deep.

A Splendid Example of COLOUR-WORK in Permanent Ink Photo. by M. PAUL AUBERT BAUDOUIN.

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

In consequence of the almost daily demand for these plates, they have been reproduced by Subscription at Half a Guinea the Set, and are ready for issuing. Free by Post, carefully Packed inside Patent Roller.

GILBERT WOOD &amp; CO. Ltd., 6-11 IMPERIAL BUILDINGS, LUDGATE CIRCUS, LONDON,

y far the largest yet realised. During the first four years the  
tation was worked at considerable loss, reaching in the first  
ear 1,977*l.*, and showing a gradual reduction in subsequent  
ears. These losses fell upon the rates of the city, and will be  
apaid from time to time as the profits accrue. In view of the  
profits expected, 5*co*l. was appropriated by the finance com-  
mittee to assist the rates, and the remaining 88*5*l. 6*s.* 2*d.* the  
ectricity committee desire should remain in their hands for  
nergencies.

A LOCAL GOVERNMENT BOARD inquiry has been held at  
unbridge Wells with reference to an application by the Cor-  
poration to borrow a further sum of 15,000*l.* for the purpose of  
extending the Municipal telephone system. Mr. W. C. Cripps,  
ie town clerk, stated that six months ago the Corporation  
plied for a loan of 10,000*l.* to commence the system, and it  
as calculated that that would enable them to provide tele-  
onic communication for 319 subscribers. So rapid had been  
e progress, and so successfully had the Corporation managed  
e undertaking, that there were at the present moment 535  
venue-bearing lines in existence, and 283 persons were  
aiting to be connected, making a total of 816 subscribers.

### VARIETIES.

is reported from Warsaw that negotiations have been  
ened there by some English capitalists for the construction  
a harbour, docks and boulevards on the Vistula, and the  
ilding of a slaughter-house, from which beef would be for-  
rarded to England. A company with a capital of from  
00,000*l.* to 4,000,000*l.* is being formed in order to carry out  
e necessary works. An hotel on a considerable scale is also  
e erected.

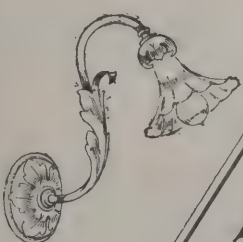

A NEW library, designed to serve the Kilburn district, has  
en opened at Coteleigh Road, Hampstead, without any public  
emony. The library has been erected by the Hampstead  
orough Council to replace a temporary one at Priory Road.  
ily the reading and reference-rooms are at present open, as  
e 6,000 books in the lending department have not yet been  
atalogued. This is the fifth of the libraries and reading-  
oms now under the control of the Hampstead Borough  
ouncil

THE adjourned annual meeting of the Manchester Associa-  
on of Engineers was held at the Grand Hotel, Manchester,

on the 8th inst., the president (Mr. E. J. Constantine) in the  
chair. There was a large attendance. Mr. Nasmith was  
elected a trustee in the place of the late Mr. Dixon. The meet-  
ing adopted several important alterations in the rules. It was  
resolved that the objects of the Association were to be the  
bringing together of those engaged in the direction and super-  
intendence of engineering works for mutual improvement and  
assistance. Mr. Ingham introduced a discussion on "Portable  
Machine Tools," and various members took part in it.

IN the course of the past year considerable progress was  
made in the extension of Ayr as regards the erection of public  
buildings, public works and dwelling-houses, as is shown by  
the number of warrants granted at the Dean of Guild Court.  
The number of warrants granted was 126, including that for  
the reconstruction of the town hall at a cost of 10,500*l.* The  
total estimated amount of money involved was approximately  
over 90,000*l.*, the larger proportion of which has been, or is  
being, expended in the erection of middle class houses and  
workmen's houses of a superior kind, chiefly on new leases, par-  
ticularly in Newton and Wallacetown districts. The building  
has been for the most part speculative, but the houses com-  
pleted have been readily taken up as soon as ready for  
occupation.

THE town hall, Stone, Staffs., having been closed for some  
months for alterations, was reopened on the 6th inst. The  
hall, which originally cost 3,200*l.*, was opened in 1870. The  
only noticeable alteration to the exterior of the front has been  
the addition of a glazed canopy extending over the pavement.  
The vestibule has been widened by the removal of the brick  
walls on either side, and the substitution of massive, bold wood  
panelling, the weight of the upper part of the building being  
supported by newly inserted iron girders. At this end of the  
hall a new balcony has been built to accommodate about ninety  
persons. The main hall itself has been enlarged by removing  
the old stage and putting that space into its length. The  
former most inadequate anterooms have been removed, and a  
new stage, 30 feet by 24 feet, has been provided, off which and  
on the same level are two commodious retiring-rooms, and  
again below these and below a part of the stage are arranged  
a set of three good rooms. The lavatory and sanitary  
arrangements throughout have been entirely revised and  
improved, and the basement rooms at the front have been  
altered and made habitable for the caretaker's use. The  
whole of the new and altered portions of the hall have been

--	---	---

redecorated throughout, and the scheme of decoration is very tasteful. The lighting and ventilation of the main hall have been revised and greatly improved. The building contractor was Mr. J. Wilcox; Mr. H. Turner has carried out the contract for the decorations, and the plans were prepared by Mr. R. Arrowsmith.

THE restoration of Brechin Cathedral is now completed. The task at which the tradesmen have so assiduously worked is now accomplished, and their labours have resulted in an addition to the architectural features of the country. The edifice forms a striking picture, perched on its rocky knoll. From the north-east corner the new Queen's aisle is prominent, and the general effect of the building is thus somewhat lost; but from the south and east the graceful proportions of the building are better seen the square and round towers fittingly completing the picture. The work required of the builders was to restore the aisles and part of the chancel, and the work carried out harmonises well with the general scheme of the building. No attempt at any ornate work has been made, the quiet simplicity which characterises the nave being maintained throughout. In the south aisle there are three lancet windows in keeping with those left in the ruins of the chancel, while the north aisle is similarly treated, the only artistic work being under the eaves, where from end to end a number of masks have been sculptured. In restoring the chancel, great pains have been taken, but here also simplicity has been aimed at and maintained. The interior alterations have been very great, but the work has been carried out with striking good taste, as was to be expected with Mr. Honeyman, R.S.A., as architect. The cost of the restoration amounted to 12,000*l.*, of which 1,000*l.* has yet to be subscribed.

THE Blackburn Road Congregational schools, Bolton, were opened on Wednesday by Mrs. W. H. Lever. They occupy a commanding position on Blackburn Road, at the junction of Draycott Street and nearly opposite the church. The building has a frontage to Blackburn Road of 138 feet and a depth of 81 feet, and consists of a large central hall with two wings joined to the main building with spacious corridors. The hall is 64 feet 6 inches long by 40 feet wide and 34 feet high, with gallery on three sides, will provide seating accommodation for about 1,000 people, and is intended to be used for concerts, lectures, &c. The principal entrance to the hall is from Blackburn Road, but access to it can also be obtained from each of the wings, and three staircases communicate with the gallery. The wings are each two storeys high, and contain the

classrooms, twenty-nine in number; and also on the ground floor an infants'-room, 34 feet long by 20 feet wide, with separate entrance from Draycott Street, secretary's-room, kitchen, cloakroom and lavatories, &c., and in the north wing on the first floor, a small assembly-room is provided, 46 feet long by 20 feet wide. The buildings will be warmed throughout by hot water on the low-pressure system, and lighted by electricity. The schools have been designed to harmonise with the church (in the Late Gothic style), and will be built of Accrington red plastic bricks with Denis's Ruabon terra-cotta for the dressings, the roofs being covered with Elterwater green slates. Internally the walls of the rooms and corridors will be wainscotted to a height of 4 feet 6 inches, and finished above with plaster. The central hall and small assembly-room will have open timber roofs of pitch-pine, whilst the joinery work throughout will be executed in Kauri pine, slightly stained and varnished. Mr. R. W. Kenyon carried out the works from the designs and under the supervision of Mr. John Simpson, of Bolton.

### BUILDING AND BUILDERS.

THE Glasgow Water Commissioners have been empowered to borrow half a million sterling towards carrying out a scheme for obtaining a water supply from Loch Arklet.

THE proposed new parish church for Skelmersdale, which is estimated to cost about 8,000*l.*, is to be erected in the vicarage ground adjoining the old burial-place.

WORK will shortly be commenced in connection with the new lighthouse to be erected on the island of Hyes Kier, one of the lesser of the Hebridean group, adjacent to the island of Canna. The contractors for the work are Messrs. D. & Macdougall, Oban.

THE arbitrator in the Maidstone building trade dispute has decided a vital point to carpenters and joiners, namely, that the rate of pay for overtime should commence after an ordinary day's work, instead of after a ten-hours' day, as proposed by the Master Builders' Association.

THE designs submitted by Messrs. George Baines & Palmer Baines have been accepted for the Baptist church at schools, South Bank, Yorkshire. The accommodation provided in the church is for 542 adults. The estimated cost is 4,380*l.* A bold tower forms a feature of the design.

competitive designs for the Isle of Wight Queen's Memorial to the number of fifty received by the committee are being publicly exhibited at the Town Hall, Newport, Wight, until Monday next, the 24th inst., from 10 A.M.

J. GOODACRE, architect, and Mr. Cartwright, of the parish church, Diseworth, in order to decide what measures should be taken to the walls of the old edifice. Mr. Goodacre states that the walls ought to be cleared of the plaster and repointed. The cost of repairing the walls will be between £400 and £500. The work is to be commenced at once.

E. A. SANDFORD FAWCETT, inspector of the Local Government Board, held an inquiry at Burslem on the 12th inst., with respect to an application of the Corporation for power to borrow £24,000 for sewage disposal purposes. The Council adopted the bacterial system, and the necessary works and an outlay of the sum sought to be borrowed, including the cost of land and extra construction. The scheme having been generally approved, there was no opposition, and the Corporation intimated that he would report in the usual way.

An inquiry into an application by the West Riding County Council to borrow £23,744 for the erection of a hospital for diseases other than small-pox, by the Colne and Wharfedale joint isolation hospital committee, at Meltham was held by Mr. F. St. George Stuart, Local Government Board inspector, at the Union Offices, Huddersfield, on the 12th inst. The townships prepared to be served by the hospital are Golcar, Holme, Holmfirth, Honley, Linthwaite, Meltham, Netherthong, Newmill, Scammonden, South Crosland and Thurstonsland. The rateable value of the whole area is 182,831 $\frac{1}{2}$ l., and the population 54,100. It has been decided to construct a new bridge over the river, near Bournbrook Road, Worcester, on the Bristol side. The old structure was of brick and arched, but only 12 feet wide, and no footpath was provided over either side. For a long time it has been regarded as not only too small for the traffic, but as being unsafe. Now it is to be replaced by a new girder bridge 42 feet wide, with an 8-foot footpath on each side of the road. The improvement will be a most important one in the interest of pedestrian and vehicular traffic. The bridge forms the dividing line between the city and the suburbs of Worcester, the cost will be borne by the two authorities, but the County Council have left the whole of the work to be carried out by the Corporation.

COL. A. C. SMITH, C.E., an inspector of the Local Government Board, held an inquiry recently at Mirfield into the application of the Mirfield District Council for sanction to borrow £2,600 for the purpose of purchasing Fold Head estate, in Easthorpe, Mirfield, for council offices. The property consists of a large block of buildings, all of which the Council propose to use for offices, but they contemplate erecting a council chamber, at an estimated cost of 500 $\frac{1}{2}$ l. The present meetings of the Council are held at the town hall, which belongs to a private company. The clerk to the Council (Mr. E. B. Wilson) and the surveyor (Mr. F. H. Hare) explained the plans of the Council to the inspector, who subsequently visited the estate.

THE annual dinner of the Bath Master Builders' Association was held on the 14th inst. at Messrs. Fort's restaurant, Milsom Street, Bath. The dinner was the first which had been held since 1899, the war in 1900 and the death of Queen Victoria in 1901 being the cause of the lapsing of the fixture. The president, Mr. A. Wills, occupied the chair, and was supported by the mayor (Mr. E. E. Phillips), the ex-mayor (Mr. T. B. Silcock), the town clerk (Mr. B. H. Watts), Alderman R. H. Moore, Councillors Knight and Stone, Major C. E. Davis, Messrs. G. J. Long (president of the South-Western Federation of Building Trades Employers), C. H. Long (ex-president of the Bath Association), E. J. B. Mercer (hon. sec.), E. W. Wooster and John Howard (past presidents), &c., the company numbering seventy-four in all.

ARRANGEMENTS have now been made for restoring the Iona Cathedral to its pristine proportions and appearance, from the designs of Messrs. MacGibbon & Ross, of Edinburgh. Messrs. Mitchell & Sons, of Edinburgh, have, we understand, received the contract for this important work, which, it is hoped, will be entered upon early in spring. The cathedral or St. Mary's Church is believed to have been built in the early part of the thirteenth century. It has a choir with a sacristy on the north side and chapels on the south side, north and south transepts, a central tower 70 feet high and a nave. An inscription, now defaced, on one of the columns of the choir seemed to denote that it was the work of an Irish ecclesiastic, who died in 1203. This venerable pile forms part of the estate of the Duke of Argyll, who, shortly before his death, formally transferred it to the Established Church of Scotland.

THE old building known as the Archers' Hall, which for long has in a way been a conspicuous figure standing back from the thoroughfare in Buccleuch Street, Edinburgh, has

been reconstructed in substantial and elaborate style, from plans prepared by Dr. R. Rowand Anderson. The original structure formed a square of about 40 feet. All that remains of it now are the outer walls. An addition has been made at the south end, and the piece of ground which stood open in front has been enclosed with ornamental wrought-iron railings and gates. As reconstructed the hall of the Royal Company of Archers consists of three floors. The basement is given up to kitchen and scullery, housekeeper's rooms, &c. The first flat includes a large entrance hall, having a black and white marble floor and being panelled in white, with ample cloakroom and lavatory accommodation running off it. Occupying the entire length of the old building on the west side is the reception-room, 40 feet long by 20 feet wide, a spacious apartment, partly panelled and partly lined with tapestry. One of the features of the remodelled building is the principal staircase. It has two broad flights of stone steps, the walls are panelled in white, the ceiling is lofty and is tastefully decorated in plaster-work, and admirable light is secured by means of a beautiful three-light window. This staircase leads to the dining-hall on the upper floor, which also fills the whole area of the old building, and, like the reception-room, is exceedingly handsome in every way. It has a high and richly-decorated plaster ceiling, and has depending from the centre a specially made electrolier of chaste design, the gift of an Archer. Throughout the building is lighted by electricity, and the internal fittings and furnishings generally are beautiful and most attractive. The alterations, which have been made solely at the expense of the members of the Company, were described and exhibited by Dr. Rowand Anderson on Saturday afternoon to a large party of gentlemen representing the Edinburgh Architectural Association.

#### NEW TOWN HALL, LLANDUDNO.

LLANDUDNO rejoiced on the 10th inst. at the opening of its new town hall, a handsome building which has been erected at a cost of about 20,000*l*. The new building, which is the latest monument to the enterprising spirit which animates the rulers of this popular watering-place, stands in Lloyd Street, and occupies a site which was presented to the town by Lord Mostyn, who laid the memorial-stone more than two years ago. The absence of suitable accommodation for the Council and

its officials, and the holding of courts, has been regarded as a serious drawback in a town which has kept with the times in other respects. Hitherto the meetings have been held in a small, dingy room, situated at one extreme end of the town, while the magistrates and court judges have had to hold their sittings in a mere room for a court-house; but all these difficulties are vanquished by the present building, which, as regards appearance and convenience which it will afford for the transaction of municipal and public business of the town, is undoubtedly credit to Llandudno. It was designed by Messrs. S. Ray, Bath, the plans being selected out of fifty submitted in competition, and the carrying out of the work reflecting the greatest credit upon Mr. Luther Roberts, a local contractor. The design is described as a free treatment of the Renaissance. The walls are built of Portland stone with brick. A feature of the design is the large porch on the ground floor. It is placed at the rear of the building, and enclosed by the two wings. It is lighted by ten semicircular side windows and a large arched window at the end. The walls are panelled, and the roof is covered by a large ornamental timber roof, ceiled with oak. Ample means of exit are provided, so that the hall may be cleared instantly. This hall will be let for court and police court work, and adjoining it are retiring-rooms for magistrates and solicitors. It is also so arranged as to be used for entertainments and such gatherings entirely apart from the municipal portion of the building. The main attraction of the building is the Council-chamber, which occupies the whole of the first floor in the centre block. It is lighted by three large windows, and the interior is elaborately treated with columns and arcading supporting a coved ceiling. The furniture of oak is massive and elegant, and adds to the dignity to the general appearance of the chamber. Immediately adjoining this room are the committee-rooms and clerks' offices. One wing of the building is devoted to a suite of offices for the Council, and they are provided with a separate staircase, and are entirely cut off from the municipal offices. The lighting of the entire building is by electricity, and the Council-chamber, the assembly-hall, the spacious vestibule, and the grand staircase are provided with richly designed brass eleb. These parts of the edifice are also warmed by a system of hot-water radiators, and the whole of the office is fitted with apparatus for gas fires.

## ACCIDENTS ON BUILDINGS.

subjoined memorandum on the causes of common accidents that occur on buildings in course of construction or repair, and hints for their prevention, has been issued from the Office. The modifications introduced have been made in accordance with the suggestions of leading experts who have been consulted:—

In the following memorandum an attempt is made to explain and illustrate those accidents, the causes of which may be considered controllable by the builders and workmen.

The dangerous conditions in building operations may be divided into two classes—(a) those arising from imperfect scaffolding, and (b) those arising from the lifting and carrying of material.

### Scaffolding

The two principal methods are known respectively as the north and south country systems. The northern, as the name indicates, is principally used in Scotland and the North of England, although of late years it has also found favour in the south; the other method (see fig. 1) is essentially the south country system.

The first method is invariably used in conjunction with a steam crane. When one crane only is used, it is fixed upon a triangular platform built upon three legs at each angle, and is raised to such a height as to be over the building to be erected. The crane stands over the principal or king leg. Owing to the guys it cannot make a complete revolution; if power is required that can be utilised on all parts of the building, the erection has a square platform with a leg at each angle, two cranes are then fixed, being diametrically opposite to each other.

The three or four legs, as the case may be, are of framed iron, bolted, and are weighted to the ground by masses of brickwork. The whole is so well built that accidents occurring from faults of construction are extremely rare.

The greatest dangers arise when the crane is imperfectly fixed, and when the weight of the crane engine and load is too great for the king leg on which it rests, and when the legs are not sufficiently far from the king.

With regard to the first point, the guys of the crane should always be carried to the centre of the secondary legs and chained down to the masses of brickwork which weight

these legs at their feet. This chain requires frequent examination, especially when a heavy load is being raised, as, owing to the vibration of the scaffold, it becomes loose, and if not tightened the crane would lose its rigidity and accidents would be likely to occur.

6. In the second case, where the weight is great, the king leg should have an additional centre upright running from top to bottom. (See fig. 2, which is a plan of a king leg.)

7. The second form of scaffolding presents many points of interest. In order to render this report more intelligible, notes are given on the sketch (fig. 1) which explain the technical terms used. There are two varieties, again, of this form of scaffolding, and their use depends upon the material of which the building is being constructed, viz. either of brick or stone.

8. Where bricks are in use one row of standards and ledgers only are necessary, the putlogs resting outwardly on the ledgers and inwardly on the wall (where header bricks have been left out for their reception).

9. On stone buildings, and more especially when ashlar fronted and where an opening in the wall would leave a permanent disfigurement, a double set of standards, &c., are necessary to carry the putlogs. (See fig. 3, which is a section of what is known as a mason's scaffold.)

10. A few points with regard to these erections.

11. The different marryings, tyings, &c., should be carefully watched, as scaffolds have been known to come down owing to the cords slipping. This happens more especially when the cords have been used damp, the influence of a hot sun causing them to relax considerably. Wedge driving between cords and posts is the usual method of tightening.

12. The boards on which the men work should be carefully kept in position. Fig. 4 shows the usual position of the boards. Carelessness may and does result in these losing their place, and if by so doing they take the position shown on fig. 5, what is known as a trap is formed. Fig. 6 illustrates the working of a trap. It will be noticed that when on the boards it is not easy to tell where the putlogs are. This creates to a great extent the danger. A certain preventive would be for the putlogs to be used in pairs, the boards then instead of overlapping could be placed end to end (see fig. 7); in overlapping boards get out of place, and a second man of two may catch his toe against the end raised.

13. Two of the commonest forms of accidents occur on these scaffolds, the falling of the workmen, and the dropping of the material from the upper floors of the erection. On the

A. DREW WILSON writes as follows:—"The 'Tubor' Filters sold by the Berkefeld Filter Co., Limited, London, W., remove all germs from water. They therefore represent ideal filters, giving pure (i.e. germless) water, and thus prevent Typhoid and many other diseases."

outside of the scaffold, also at the ends, a guard rail should be lashed to the standards about 3 feet 6 inches above the scaffold boards. This would obviate the first danger. With regard to the second the danger from falling material is much to be deplored, as though it can occur in many ways, it is, as a rule, the result of great carelessness. A board on edge running along the outside of the scaffold, but within the uprights and nailed to them, and again at the ends, would, to a great extent, prevent this class of accidents. Unfortunately, this board cannot be fixed on the inward side of the scaffold, as it would interfere with the free use of the workmen's tools. Figs. 1 and 3 show the guard rail and board on edge.

14. A mason's scaffold should be supported in such a manner that no opportunity could occur for it to fall away from the building. Fig. 3 shows the shoring, which is the usual method of preventing this where room permits; but this cannot be applied in a street, and in that case the scaffold should be tied to the inside of the buildings by poles through the openings.

15. There are other conditions of risk involved in insufficient width of runs, and in the use of centring improperly supported. A run is commonly seen only one board wide (9 inches). It is needless to say that this width is dangerous; 18 inches is the least that should be allowed. A run for continued use would be better made of two 3-inch by 11-inch planks if two planks are used. A slip of wood can be nailed across the undersides to keep them together. Fig. 8 is a plan of a working platform surrounding a courtyard or well, and gives three examples of runs which are commonly used, but which are not satisfactory.

16. Improperly supported centring is seen only in cheap work. Figs. 9 and 10 give an example of what is meant. It will be noticed that the supports to the centring of fig. 9 are kept in their position entirely by the lateral pressure exerted by the stay A. It follows that, if this pressure is eased sufficiently, say by shrinkage, it is more than probable that the centring and a large portion of the unfinished arch would fall. Fig. 10 shows the centring properly supported. All supports to centring should rise from a solid foundation.

16A. Painters' boats occasionally fall owing to the use of defective cordage and supports. Care is the only remedy that can be suggested.

16B. Gantries, especially those erected over the public way, having to carry great weights, should be effectively strutted and braced, and timber of sufficient strength used.

*The Lifting and Carrying of Material.*

7. Very little danger arises during the lifting and carrying of material so far as the power in use is concerned. The accidents generally occur owing to the defective manner by which material is secured to the crane, pulley wheels or whatever arrangement for lifting may be.

*Ironwork.*

3. Ironwork is principally used in the forms of girders or ladders. They are sometimes slung by a chain round the sides and as evenly balanced as may be. There is considerable danger of this chain slipping, however well balanced (more especially if the load when swinging is tilted, say by receiving the material through touching some part of the erection) and thus the material to fall. To prevent this a second chain may be run from each end of the column or girder to a point at a distance up the supporting chain, but the best remedy is to use a "softener," i.e. an old bag or sack put round the ironwork and the chain turned twice round it over the "softener" and knocked as close as possible, then no slipping will take place.

The same applies to timber.

*Timber.*

9. Timber in lengths can be carried in the same manner as the iron girders, but owing to the greater friction set up between wood and iron it is not so likely to slip as the former. The same precautions, however, are necessary.

*Bricks, Slates, &c.*

5. Bricks, slates, &c., in large quantities are slung in cranes, in smaller quantities in baskets, and in small work are carried in hods by labourers.

1. The crates (fig. 11) will carry as many as 350 bricks. It will be noticed that they are not fitted with sides. This is to facilitate loading. The chief danger arises from their use when they are improperly packed. When suspended the pull on the handles causes the ends to take an inward slope. If the crate is tightly packed this pull creates a pressure on the material, and tends to keep it in position, but if loosely packed the absence of sides would be a source of danger, as the material could easily fall out.

2. If a similar crate was used to carry a roll of lead, it would be necessary to place a stay (B, fig. 12) across the top to counteract and relieve the strain at the bottom.

23. When baskets are used, the danger lies in the handles. If they are hooked to chains, which is the usual method (fig. 13), the weight may and does cause them to give way. One remedy is for the chain or rope to be carried round the basket, as shown in fig. 14. The pieces of wood marked R, if fixed as shown, would give the basket a level bottom, and would also tend to prevent the rope slipping. A better course would be so to construct the basket that the material of which the handles are made should be carried down the sides and along the bottom of the baskets and well secured thereto. In any case care should be taken to see that the baskets are strong enough in the first instance, kept in proper repair and not overloaded, and that spring hooks be used on the slings.

*Stone.*

24. There are several methods of lifting stone. It can be lifted in the same manner as ironwork, or may be suspended by means of a "lewis," or again by means of nippers.

25. The first method is perhaps the safest, but is generally used for undressed work only, as the chain is apt to break up any finished edges, &c.

26. The second method—by a lewis. A hole is cut into the stone wider at the bottom than at the top, three pieces of iron, as shown on fig. 15, are fitted into it, the outside or splayed pieces first, and the rectangular centre piece last. A bolt running through the top of each fixes its position, and at the same time secures a ring into which the hook, by which it is to be lifted, is placed. This arrangement will lift a very great weight. They are made in all sizes to suit; the softer the stone the deeper they ought to be in proportion to the weight. The risk of its giving way if the stone is not free from vents, or when the lewis does not fit the hole, or again, if the weight is not evenly distributed, is considerable. Its use with perfect safety can only be left to the judgment of the mason.

27. The nippers clutch the stone on the outside. Danger may arise if the small holes picked out to receive the nippers are so near the top edges of the stone that the points drag out; or again, the centre of gravity may be above the points, causing the stone to turn over and fall.

28. It is, of course, assumed that the plant in use has been, both in point of quantity and quality (and the first is of equal importance with the second), fully sufficient. It is regrettable that often in actual practice this has been found not to be so. Inferior tackle has been and is responsible for many accidents. Many lives, again, could have been saved if a little forethought

had been used, and compliance made with those unwritten rules by which workmen should be guided. Fig. 16 will give a clear illustration of what is meant. A labourer in building a scaffold required a ledger at point A. He fetched it from point B. He carried it upon his right shoulder, and in turning the corner in the direction of the arrow the end of the pole struck against standard C. The recoil immediately knocked him off the scaffold. If the pole had been upon his left shoulder the blow would have fallen harmlessly, and his life would not have been lost.

The following suggestions, if carried out, would tend materially to reduce the number of accidents occurring on buildings in course of construction or repair:—

(1) All working platforms above the height of 10 feet taken from the adjacent ground level should, before employment takes place thereon, be provided throughout their entire length on the outside and at the ends—

(a) With a guard rail fixed at a height of 3 feet 6 inches above the scaffold boards. Openings may be left for workmen to land from the ladders and for the landing of material.

(b) With boards fixed so that their bottom edges are resting on or abutting to the scaffold boards. The boards so fixed should rise above the working platform not less than 7 inches. Openings may be left for the landing of the workmen from the ladders.

(3) All "runs" or similar means of communication between different portions of a scaffold or building should be not less than 18 inches wide. If composed of two or more boards they should be fastened together in such a manner as to prevent unequal sagging.

(4) Scaffold boards forming part of a working platform should be supported at each end by a putlog, and should not project more than 6 inches beyond it unless lapped by another board, which should rest partly on or over the same putlog and partly upon putlogs other than those upon which the supported board rests.

In such cases where the scaffold boards rest upon brackets, the foregoing suggestion should read as if the word bracket replaced the word putlog.

N.B.—Experiments have shown that a board with not more than a 6-inch projection over a putlog can be considered safe from trapping or tilting.

(5) All supports to centreing should be carried from a solid foundation.

(6) In places where the scaffolding has been sublet to a

contractor, the employer should satisfy himself, before allowing work to proceed thereon, that the foregoing suggestions have been complied with and that the material used in the construction of the scaffold is sound.

## BRISTOL CLERKS OF WORKS AT DINNER

THE ninth annual dinner of the Bristol Clerks of Works Builders' Foremen Association was held in the Royal College Green, on the 15th inst., Mr. P. Addie presiding, a large attendance, and there were also present Capt. Thompson, I.V.B., Messrs. A. Lee (president of the Chamber of Commerce), W. J. Steele (deputy city engineer), V. Woodland, H. Wills, F. Wills, A. S. Scully, W. S. Skidwell, G. Wilkins, E. Turner, J. N. Pike and J. Rees.

After the loyal toasts had been proposed, Mr. W. A. W. land submitted the "Army, Navy and Auxiliary Forces," said that they were justly fond of their Navy. The Army proved that they possessed the same pluck of endurance as those of olden times, while the Volunteers had shown themselves as good as regulars.

Captain C. Thompson, 1st V.B., responded, remarking their Navy, coupled with that of Japan, was equal to any Powers.

Mr. H. Wills also replied.

Mr. R. Slaughter gave "Trade and Commerce of Bristol."

Mr. Arthur Lee acknowledged, and said that trade and commerce was only another term for means of livelihood, if they increased trade and commerce anywhere they increased—and they could not help it—the means of livelihood for those in the neighbourhood. Increased trade and commerce meant increased means of livelihood, and that not for those who laboured by hands or by brains, but even for the capitalist, because it had been well said that money was manure, which was no good unless well spread. Those in the building trade knew that it was in the centres of population and trade and commerce that the building trade flourished. They would find that in every case a great increase of population had arisen simply because of the facilities for carrying on some particular trade or industry, the number of trades and industries. The existence of a city was due to the natural facilities for the trade.

goods in days gone by. In the old days it was facilities alone which was the reason for those great nations of humankind; but of recent years they had at artificial facilities had the same effect. There was a case not many miles from Bristol. Take the case of Barry. Twenty years ago the land around Barry provided of livelihood for a population of 100 souls. A great town has been built there. There were increased facilities for trade and commerce, and that gave immediately largely increased of livelihood, and to-day, in less than twenty years, there are means of livelihood for over 300,000 people. Under new conditions, and the natural facilities good for the old days must be supplemented by artificial ones. Depend upon it, as in the old days when they followed those places where there were natural so they would find trade would follow and in those places where people were far-sighted to provide artificial facilities. Those artificial facilities not be provided for nothing. Some timid souls would be about running into debt. If the capital put down to be productive he did not mind in the least about into debt. If it meant increased livelihood they must be too timid at the bugbear. Of course they must run risks. They knew nothing could be done without hard and consistent effort. For the future of the great under- which they had put their hands, he had less fear day because he saw the spirit and temper of the citizens of the town. He believed they had a body of citizens who were determined to make their city great, and to begrudge neither effort to bring about that desirable object. Mr. A. S. Scully in a capital speech proposed "Architects, Surveyors and Surveyors." Mr. F. Wills, responding, spoke of the good feeling existing between the masters and their men. Mr. W. S. Skinner also

Mr. W. Kidwell and W. J. Steele submitted "The Master Builders," and said there was no town in the Kingdom where there were such amicable relations between master builders and their men as in Bristol. Mr. G. Wilkins (president of the Bristol Association of Builders) acknowledged. The Chairman proposed "The Bristol Association of Clerks and Builders' Foremen," and said that their society was going in the right direction. The clerk of works stood in the position as an umpire at cricket. They held a position

which was no sinecure, as they had to know everything connected with the engineering and building trades, and he had to be a man of rectitude. Their responsibilities were enormous.

Mr. W. F. Read and Mr. E. Turner replied.

An admirable programme of music was carried out by Mrs. Percy Smith, Messrs P. Smith, G. Maxwell and Stanley Williams; while Mr. H. D'Arby contributed some violin solos in fine style.

#### WALSALL NEW MUNICIPAL BUILDINGS.

In view of the interest aroused by the impending Royal visits to South Staffordshire—that of the Duke of Connaught to Wolverhampton to open the exhibition, and of Prince Christian to Walsall to lay the foundation-stone of the new municipal buildings—the *Birmingham Post* gives the following details of the scheme in which the Walsall municipality is particularly interested. The project for the erection in one block of a new town hall and offices for all the various Corporation departments is an undertaking which perhaps surpasses in magnitude anything Walsall has undertaken, for although the tramway municipalisation scheme, which is also being carried out at the present time, involves a much greater expenditure, there is the important distinction that in the latter instance the outlay may be expected to bring in some return, which will lighten the burden on the ratepayer occasioned by the necessity of repaying the loan or loans which will have to be obtained, with interest, in annual instalments. In the case of the municipal buildings, however, the town has to face a capital outlay of probably 80,000l., with the prospect of the expenses of maintenance being responsible for a further annual and permanent addition to the rates. Having resolved that the provision of public buildings on a scale befitting the importance of the town had become a necessity, the Town Council acted wisely in securing a site which, for accessibility from all parts of the town, could scarcely have been surpassed. Future requirements were also not overlooked, as sufficient land was secured to enable the buildings to be added to when necessary. In an open competition the design which gained acceptance was that submitted by Mr. J. Glenn Gibson, of Gray's Inn, London, who, it may be mentioned, was the architect for, among other public buildings, a new hall for the West Riding of Yorkshire County Council, costing 120,000l., and a technical institute for the Corporation of West Ham, costing

60,000l. The principal frontage of the public building which Walsall hopes soon to possess will be to Lichfield Street, which is rapidly becoming recognised as one of the principal thoroughfares in the borough, and, as already indicated, the position is such that it is within a stone's throw of the centre of the town. It is understood that stonework will be freely introduced into all Lichfield Street front, which is to be about 170 feet in length and divided into two wings, with a central gable containing the entrance doorway and large enriched columns extending to the height of the building. A tower about 140 feet high will be placed at the right-hand end of this frontage, and it is proposed that this should consist of a square mass of masonry to a height of about 60 feet, above which level it will develop into a rich belfry stage, having seated figures carved in stone, and above this a delicate open-work lantern surmounted by a crown. There will be another front, which will face the Corporation baths between Lichfield Street and Darwall Street, and this will be treated in the same style as the principal front, but with less elaboration of detail. The chief features will be the tower and a fine central pavilion. The whole of this part of the building will be utilised for offices for the Corporation officials. The entrance to the town hall will be from Leicester Street, but it can be used in conjunction with the entrance to the municipal offices. In this front there will be a central doorway with a tower on either side, containing the gallery stairs. The plans provide for the completion of the edifice by an extension to Darwall Street, and it is an open secret that it is hoped that the buildings to be added will be for use as a picture gallery and museum, with an entrance from Darwall Street. It will be seen from the above description that the block will form one large square with a street on either side, and this will no doubt prove a matter of considerable convenience.

As regards the internal arrangements and the accommodation which will be provided, it may be mentioned that the town hall will be about 120 feet long by 58 feet wide and 45 feet high, lighted by large windows at each side, and with a vaulted roof. A good deal of enrichment in colouring with heraldry and figures will be introduced, and a pretty effect is promised. The platform will be semicircular, and will have accommodation for 200 persons, with an orchestra stage. At the back will be placed an organ, a fund for the purchase of which is being publicly raised, and which is intended as a memorial of Queen Victoria's reign. The hall, it is stated, will seat 1,700 persons, and there will be the usual retiring and

other rooms in addition. The municipal buildings will be reached from the principal entrance in Lichfield Street. There will be a spacious vestibule, which will lead to an columned hall in stone, with stairs at each side, giving access to the first floor, where the council chamber will be situated. The council chamber will, apparently, be of a character sufficiently elaborate to satisfy even the most fastidious councillor or alderman. The dimensions will be 50 feet by 35 feet, and there is to be a dome with a ceiling carried on four large marble columns. It is proposed to have stained-glass windows, the subjects for which are not yet decided. There will also be a domed light in the ceiling. The members of the council will be arranged in the centre of the floor, and there will be a gallery for the public. In proximity to the council chamber will be a suite of committee rooms capable of being thrown into one large room 80 feet long by 20 feet wide. These rooms practically take up the whole of the Lichfield Street front.

The general style of the building may be described as English Renaissance, but it will be sufficiently modernised to adequately meet the need for plenty of light and air, and the convenience of arrangement of the various apartments. The character of the decorative sculpture employed will also be in accordance with present-day tastes. It may be mentioned that the excavations for the foundations of the buildings are now in course of construction, and the contract for the whole of the work is to be completed in about two years' time.

A SPECIAL meeting of the general purposes committee of the Middlesbrough Corporation was held at Middlesbrough on the 4th inst., Alderman W. J. Bruce presiding, for the purpose of considering the resignation of the town clerk (Mr. C. Bainbridge), which has become necessary consequent upon long and protracted illness. Mr. Bainbridge was appointed town clerk twenty-five years ago and has done excellent service for the town. The committee recommended that Mr. Bainbridge should be relieved from his responsibilities, and he be so relieved at the end of the financial year, March next. They also recommended that he receive from the corporation a sum equal to six months' salary. These recommendations, on the proposition of Colonel Sadler, seconded by Alderman Hinton, were carried.

# The Architect.

## THE WEEK.

By the death of DAVID MACGIBBON on Thursday in last week, architecture and architectural literature have suffered a grievous loss. But Scotland has still more reason than any other part of Great Britain to lament the loss of a son who went beyond any of his predecessors to prove to the world the interest of the ecclesiastical and domestic architecture of the North. With the aid of his loyal partner, Mr. THOMAS ROSS, he produced the eight admired volumes which contain all that has survived of the architecture of his country. Scotsmen might well be proud of so enthusiastic a work, which was a testimony to the ability of their forefathers. Mr. MACGIBBON also was the author of a large work on the "Abbeys of Galloway," which was intended for private circulation. DAVID MACGIBBON, who at his death was in his seventy-first year, was a native of Edinburgh, and was educated in the high school and university of that city. As an architect he was successful. He was appointed architect to the Merchant Company, of which his father had been master, and designed their schools and laid out their property. He was also architect to the National Bank of Scotland. Among his Edinburgh buildings are the Caledonian Insurance Company's office and the Theatre Royal. Mr. MACGIBBON obtained the honorary degree of LL.D. from the University of St. Andrews, and he well merited other distinctions.

The jurymen who agreed to assess the relative importance of the façades erected in Paris during 1900 have prepared supplementary remarks to their report. It is pointed out that in almost every instance an architect is compelled by necessity to avoid the loss of the smallest space both in projection and in height. The jury desire, however, to see some slight signs of a resolve to sacrifice financial interests for the sake of the perspective of the streets. While recognising the efforts of the designers and the good results which have followed, they consider that the differences of treatment have generally resolved themselves into one of detail. The jury maintain that it would be preferable to seek variety in the composition of the ensemble, in the proportions of openings, and in the general silhouette. The jury hope that proprietors and architects will bear these principles in mind when undertaking the future buildings which are intended to demonstrate the artistic vitality of Paris and to add to its beauty.

ACCORDING to Section 125 of the Factories and Workshops Act, a district council and their officers have, without prejudice to their other powers, all such rights of entry, inspection, taking legal proceedings and so on as a factory inspector. An inspector in default may take proceedings, and shall be entitled to recover from the district council all such expenses as have been incurred. We may expect to see diverse degrees of zeal exhibited in respect to the proceedings. In some places there may be dilatoriness which should be condemned and punished. In others there may be a difficulty in dealing with all the contraventions simultaneously, and in such cases it may sometimes be more prudent to adopt a system of grappling with one defect at a time. This latter plan has been adopted in Portsmouth. It is not a town which is generally thought to contain factories on a large scale. But the standard of the Act relates to buildings of a much smaller capacity than those in the Midland districts. Any place in which more than forty persons are employed must, for instance, be provided with means of escape in case of fire, in good condition and free from obstruction. The roads and works committee of the Portsmouth Corporation have been investigating how far the means of egress are provided in the town. They have ascertained that no less than forty establishments are without the required provision. All the proprietors will be called upon at once to comply with the Act, and it will be

left to the streets committee to take the needful steps to enforce the new law. It will be found, of course, that many other defects exist in the factories and workshops of Portsmouth which will also have to be corrected. We have referred to an order by the Home Secretary about the cubical area which is necessary in one class of building. Another order has just been issued, which prescribes that the means of ventilation to be provided and maintained in every textile factory, not being a cotton cloth factory, in which atmospheric humidity is artificially produced by steaming or other mechanical appliances, and in which special rules or regulations with respect to humidity are not for the time being in force, shall be such as to supply during working hours not less than 600 cubic feet of fresh air per hour for each person employed.

IN most cities there is a desire to introduce fire-resisting materials as largely as is practicable in buildings. It is to the general interest that such an arrangement should be made compulsory, for in cases of fire, although insurance companies may pay the full amount that is agreed upon, yet there are secondary or supplementary losses for which compensation is not easily found. It is incredible that an attempt is now being made in New York to tolerate the use of flammable materials. An alteration was lately introduced before the Board of Aldermen which provides that the sections of the Building Code relative to the fireproofing of the floor surfaces and interior trimmings of buildings exceeding twelve storeys, or 150 feet in height, shall be repealed. The consequences of facilitating conflagrations in lofty buildings are almost too terrible to contemplate, and such a proposal suggests what trafficking with danger can do. It is generally understood that the main purpose of such a change in the by-laws is intended to be the condoning of offences against the building laws of New York. Where fire-resisting materials should have been employed others of a less expensive character have been substituted. As long as the organisation called "Tammany" was supreme, violations of every law were feasible. But now that "Tammany" is temporarily discredited it is feared that inquisition may be made into many deeds of darkness, and hence the eagerness to promote a new building edict which would be retrospective in its action. It is to be hoped, however, that the desire for security will overcome all those sinister attempts which imperil human life.

THE examination of builders' accounts is often a more onerous task than public authorities imagine. One sent in two months ago in connection with the new workhouse in Steyning is still in the hands of Messrs. CLAYTON & BLACK. According to a letter sent by the architects to one of the guardians, it contained 40 sheets and 379 items, but without any details. Their principal assistants, other clerks, and themselves had already spent eighteen days on the account, and several long evening conferences had taken place. They differed from the contractors in about 200 items, and these had to be gone into. It was not to the advantage of the Board, they said, that they should be hurried or interfered with in their consideration of the account. In such a case the architects could get over a difficulty by a perfunctory examination, but as they have preferred to scrutinise all the items in the interests of the Guardians, it is not fair to urge expedition in order that the Guardians may not be troubled with applications for a settlement.

THE ancient "velum" served many purposes, for the word denoted a curtain, a screen, a veil, a sail, and much else. But to architects it is most interesting as a substitute for a roof. It protected spectators in open arenas from the heat and rain. The arrangements which were adopted in Athens and Rome are not clear. On that account much interest will be attached to the velum or awning which M. THOMAS, the architect of the Grand Palais in the Champs-Élysées, is to use over the court during the Salon and other exhibitions. It will have an area of 22,000 square metres, which is nearly equal to 26,000 square yards. In the centre will be the initials of the Society of French Artists surrounded by a garland of laurel, oak and other leaves.

### THE ROYAL SOCIETY AND THE BRITISH ACADEMY.

WE have already referred to the effort which is in progress for the establishment of a British Academy. The aims of the new institution are not fully defined, but it may be presumed to deal with the intermediate province which lies between the Royal Society on one side and an academy or society of literature on the other. In such a case there would inevitably be an encroachment on both sides. Literature is without any representative body, and cannot therefore offer an official protest, but the Royal Society has long held a secure position, and it was to be expected that it would not approve of any rival near its throne. Accordingly a petition to the KING, signed by a great many of the Fellows and other prominent men who are not yet Fellows, has appeared. The document states that the Royal Society was established by charters granted by King CHARLES II.; that the progress of learning and philosophic studies has since been great, and scientific methods of inquiry have been applied to many new fields of knowledge; that it is desirable that all the intellectual forces of the realm should be organised so as to promote the greatest advancement of scientific studies; and that instead of being embodied in a new academy, studies of history, philosophy and philology can most efficiently be provided for in some relation to the Royal Society. The petitioners, therefore, humbly pray that HIS MAJESTY may be graciously pleased to cause an inquiry to be made with a view of instituting a general and formal organisation of all the studies depending upon scientific method now carried on, similar to that inaugurated for the philosophical studies of the seventeenth century by the charters of His Majesty King CHARLES II.

We must regard the petition as being entirely inspired by a desire to extend knowledge, but fortunately it cannot be considered as official, for the President and Council of the Royal Society have sent a petition to the KING praying that the grant to the British Academy for the promotion of Historical, Philosophical, and Philological studies be granted. It is well, however, to use the occasion to consider the position of the Society of which CHARLES II. was the first patron.

There is no doubt that the Royal Society is the supreme organisation of its class in England, and it possesses also a universal reputation. We may also assume that it represents the most advanced scientific methods. They are applicable not only to the particular subjects which the Royal Society has fostered during two centuries, but to others which have not been recognised by the Society, including history, philosophy and philology. The questions should not, however, be overlooked whether the Society, after so many years' experience and practice, has not acquired a bias towards certain classes of investigation and knowledge, and whether it is not now too late to begin a reformation. In order to answer these questions, it will be necessary to consider the foundation of the Society, and to dwell upon the part taken in it by an illustrious architect, Sir CHRISTOPHER WREN.

In the old days, prior to the appearance of BACON, a great many of the followers of science were alchemists or solitary inquirers. Co-operation involved dangers. BACON, on the contrary, made it plain that if science was to be studied adequately the services of a great many labourers were indispensable. He sought after universality by making man the interpreter of all nature. Hence he proposed the collecting of a most perfect and general library, a spacious botanical and zoological garden, a goodly cabinet in which whatsoever the hand of man by art or engine hath made, and "a still house so furnished with mills, instruments, furnaces and vessels as may be a place fit for the philosopher's stone." On account of his aspirations for a combination of scientific labourers, BACON has been declared to be the true founder of the Royal Society. One effect of his suggestions was the establishment of a little society in London about 1645 to study the new philosophy, which was BACON'S. Some of the members afterwards obtained office in the University of Oxford, and there they formed a similar society. The London society was in some way connected with Gresham College. CHRISTOPHER WREN was associated with the members both in Oxford and London. In his fifteenth year he invented a diplomatic instrument or manifold writer, which enabled,

as he said, any ordinary penman "to write two several copies of any deeds or evidences, from the shortest to the longest length of lines, in the very same compass of time, and with as much ease and beauty, without any dividing or ruling, as without the help of the instrument he could have despatched but one." Unfortunately for WREN, a similar instrument was invented about the same time in France, and was brought over and patented in England. WREN invented other appliances, and "as a miracle of youth and a rare and early prodigy of universal science" he was well received by the men forming the club which was the precursor of the Royal Society. He became professor of astronomy at Gresham College, and it was after one of his lectures that he, with a few fellow-lovers of science, discussed in his room the foundation of a college for physico-mathematical and experimental learning.

CHARLES II. was favourable to the project, for he anticipated novel spectacles that would amuse him. He therefore issued a decree, which was drawn up by WREN, in which HIS MAJESTY said:—"Whereas we are well-informed that a competent number of persons of eminent learning, ingenuity and honour, concurring in their inclinations and studies towards this employment, have for some time accustomed themselves to meet weekly, and orderly to confer about the hidden causes of things, with a design to establish certain, and correct uncertain theories in philosophy; and by their labours in the disquisition of nature to prove themselves real benefactors to mankind; and that they have already made a considerable progress by divers useful and remarkable discoveries, inventions and experiments in the improvement of mathematics, mechanics, astronomy, navigation, physic and chemistry, we have determined to grant our royal favour, patronage and all due encouragement to this illustrious assembly, and so beneficial and laudable an enterprise." In these words we have a revelation of the aims of the founders of the Royal Society, and it will be seen that there is nothing that is suggestive of history, philosophy and philology. SPRAT records that the club in Oxford chiefly attended to trials in chemistry or mechanics; they had no rules or fixed method, and in London there was as little formality.

At the first meetings of the Society WREN displayed his productiveness by reading scientific papers. But system was not observed. WREN'S papers were not entered in the Transactions, and copies of them were sent abroad and published as originals by foreigners. WALLIS, who was one of the leading mathematical spirits, used also to steal WREN'S ideas. SPRAT asserts that WREN was the first to demonstrate the doctrine of motion, for DESCARTES had based his theory only on conjectures. "Give me extension and motion," said the latter, "and I construct the world." Whether he or WREN has the better claim to have first demonstrated the importance of motion as a cosmic force will be probably always a subject of dispute. The metaphysicians will, of course, side with DESCARTES. WREN was also applauded for theories of the seasons, the moon's libration, and much else of an astronomical and mathematical nature. There is no doubt he imparted a character to the Royal Society which it still retains. We can obtain a notion in another way of what WREN thought about the Society. He had already written in Oxford about "certain new designs tending to strength, beauty and convenience in building;" "embroidery for beds;" "new ways for engraving and etching;" "a new pavement, harder, fairer and cheaper than marble." But there is no evidence that he ever discussed those subjects before the Royal Society or remotely treated of the art which afterwards was to gain him renown. The method which WREN initiated was followed and developed. The members resembled him. Fellows of the Royal College of Physicians—for WREN experimented in anatomy—mathematicians and professors of natural philosophy from the first enjoyed special privileges. We may now smile at the desire to know where the wood grew which attracted fishes, or why a spider was afraid of a powder derived from grinding the horn of a unicorn; but the pursuit of knowledge in the seventeenth century was excited by these means, which were assumed to be Baconian. To possess a gallery containing philosophical instruments and a museum of natural curiosities or freaks of nature was the first ambition of the

members. After the Great Fire the Society met in Arundel House, and the owner of the mansion presented them with a library of books and manuscripts which formerly belonged to a king of Hungary. The books treated of various subjects, but it is not indicated that they were accepted as more than a token of goodwill on the part of the donor, and as a decoration of a hall where the erudite assembled. Twelve years after the foundation of the Society ISAAC NEWTON was elected a member. There was a fear at the time that a knowledge of any discoveries which might be made would get abroad, and care was taken to prevent any anticipation of the Transactions. The Society continued until the end of the seventeenth century to meet in Gresham College, then there was a removal to Crane Court in Fleet Street. Much importance continued to be attached to the museum, but when the Society went to Somerset House the collection was sold.

We have a further illustration of the spirit which animated the Society when we find the "Principia," by NEWTON, was first brought out at its expense. Through the generosity of GODFREY COPLEY a medal was presented annually to the author of the best paper on experimental philosophy. The Rumford prize was to be awarded for discoveries in heat or light. In fact, all the honours given by the Society have been bestowed on representatives of science. We cannot by any ingenuity make the patronage of the Society appear as an aid for the promotion of studies connected with history, philosophy and philology.

As we have said, the Society is Baconian in spirit. Lord VERULAM was not infatuated with the past, and its philosophy was little valued by him in comparison with his own. At the same time, like the early members of the Royal Society, he had a weakness for wonders so long as he believed they were to be found existing somewhere in the world. Now the past with all its defects, although out of place in the Society, may have extreme interest for whoever is investigating the history of philosophy or of languages. The maxim, "On earth there is nothing great but man, in man there is nothing great but mind," might be adopted as a motto of a British academy. The words would be without the least significance if applied to the works on which the Royal Society rests its reputation. We might even suppose that archæology, if taken in a broad sense, would not be out of place in the Academy, but under no possible circumstances could it be expected that any paper relating to ancient man or his work would gain a tithe of the attention of the Royal Society which would be bestowed on a communication, especially if it came from a physician, relating to a nerve of some species of the gasteropoda.

With such facts before us we see little to justify the action of the Royal Society in protesting against the grant of a charter to the British Academy. It would, of course, be well if all varieties of science could be brought into such a compass that they would become of mutual avail, but we must realise that students have only human capacities which are most limited in power, whilst the boundaries of science are expanding from year to year. Students have little chance of success unless they make themselves specialists. There are a great many classes of specialists in the ranks of the Royal Society, but they are mainly occupied with what, for the want of a better term, is called physical science. It is not difficult to conclude that the structure of a particular part of the earth has had an influence on its inhabitants, and eventually upon its language and philosophy. But speculations of that kind are rarely tolerated at the Royal Society, and it would take a long time before philologists or psychologists would accept the conclusions of geologists. Science is more likely to be extended when the students have not far to travel in order to find a common ground, and that is more likely to come to pass under an arrangement like that of the French Institut, with its academies of literature, morals, fine arts, inscriptions and sciences, rather than in a single monopolising body, although it may bear the distinguished name of the Royal Society.

An Inquiry was held at Brighton on Tuesday, the Corporation having asked leave to borrow 30,267*l.* for rebuilding the borough sanatorium. The plans were explained by Mr. May, and have been approved by the Local Government Board.

## THE CENTENARY OF VICTOR HUGO.

HAMLET was sceptical about a great man's memory outliving his life half a year unless he erected churches. It might be thought that with a volatile people like the French the Dane's words would be constantly exemplified. The number of celebrities who have passed into oblivion in spite of statues and other memorials is abundantly illustrated in the streets of Paris. Seventeen years have elapsed since VICTOR HUGO died in that city, and at his own desire his remains were carried to the Panthéon in a pauper's hearse. But the manner in which the centenary of his birth was celebrated on Wednesday is sufficient evidence that his memory is likely to have an enduring place in the French mind.

This is the more remarkable because VICTOR HUGO was not always a favourite with his countrymen. Sixty-five years ago HEINE was able to declare that the poet's worth was not recognised at its true value. According to the critic he was more truly appreciated in Germany than in France. The reason given was that although he took part in public affairs, not one of the numerous political parties could claim VICTOR HUGO as a trustworthy adherent. He had flattered the King of PRUSSIA, he had ministered to Napoleonism, he accepted honours from the Orleanist court, he professed to be sympathetic with the poor and yet posed as an aristocrat. He praised Catholicism and appeared to be eager to see a new and more socialistic Church founded. He drew inspiration from English literature, and yet might be supposed to be willing to lead an invasion of our country. In fact, there was so much that was contradictory about him, no one who desired to see a correspondence between acts and words took him for an example to be imitated or admired.

Yet regardless of all those drawbacks there could be no doubt that VICTOR HUGO was long honoured as the greatest of French poets, and, what is more, was a force whose strength was felt in contemporary art as well as in contemporary literature. In spite of the want of unity in his conduct, or it may be through that defect, he made an epoch of which some traces still survive. The truth was, VICTOR HUGO was a sporadic development of the Great Revolution. That upheaval displayed itself in war, in policy and in law. There was also revolutionary art, which was little more than a lifeless imitation of forms that were believed to be antique. But after the death of MIRABEAU there was nothing in the form of literature forthcoming that could be considered as characteristic of the period and representative of men's minds. Policy was inimical to the expression of thought. NAPOLEON at the height of his power had to confess that his mighty armies would not be able to resist the songs of Paris, and he took care that the song-writers should be inspired by fear of Imperialism. Not until VICTOR HUGO appeared was there a successor to MIRABEAU. But the condition of things had changed, and the poet's volcanic power was therefore regarded by his enemies as only an outbreak of intellectual epilepsy. Forty years earlier HUGO might have been the most dangerous of all NAPOLEON'S enemies.

In one of his poems VICTOR HUGO represents himself as a child of the revolutionary army. The first sounds with which he was familiar were drums and trumpets; he had the tricolor for a coverlet and his little head often reposed in a helmet. But it cannot be said that in any of his books he was successful in creating a soldier that we must always remember or that corresponded with a child's notions of a warrior. There are no characters which will live as long or be as universally admired as the Uncle TOBY and Corporal TRIM of another writer whose early days were passed in soldiers' quarters. We get a better idea of the revolutionary troops from the songs of BÉRANGER than from the more ambitious efforts of HUGO. In his old age he attempted a most elaborate account of the Battle of Waterloo, but the individual is of no account in it, and as he knew less of military strategy than a vivandière, he committed the most ridiculous blunders. But in all his works we see the revolutionary ardour, the desire to overthrow without much regard to the consequences.

With so much force within him it was not to be expected that HUGO would walk in the footsteps of the calm classic writers of France. But where was he to seek for models

which corresponded with his turbulence? There was only one country in the world which could offer those which he sought. In the Elizabethan drama were the opposites of the stately big-wigged *dramatis personæ* of CORNEILLE, RACINE and their followers, and from them he was able to draw immediate inspiration. For him SHAKESPEARE became the "Poeta sovrano," as DANTE called HOMER. The three greatest personages in the dramatic world were, in his opinion, HAMLET, MACBETH, OTHELLO, and the three principal sources of poetry were the Bible, HOMER and SHAKESPEARE. But it will generally be admitted that HUGO seems more akin to some of the contemporaries and predecessors of SHAKESPEARE than to the creator of TITANIA, IMOGEN, CORDELIA and ROSALIND.

There was, however, a newer source of inspiration. WALTER SCOTT revealed to HUGO that another age could be made more attractive than the siècle of LOUIS XIV. SCOTT, like SHAKESPEARE, did not believe that every character in a drama or a novel was to be dignified. HUGO had a weakness for the grotesque. He admired THERSITES and VULCAN, POLYPHEMUS and SILENUS, Satyrs and Cyclops. The witches of "Macbeth" he considered to be more true than the Eumenides of the Greeks. He insisted not only that the grotesque was inseparable from the best works in literature and in countries outside France, but it was imprinted especially on that marvellous architecture which in Mediæval times took the place of all arts. The grotesque, he said, placed its stigmata on the front of cathedrals, it framed its hells and purgatories in the arches of the portals, it appeared in flames upon the windows, and it unrolled its monsters and demons in the capitals, friezes and gargoyles. It was displayed in innumerable forms on the timber façades of houses and the marble façades of palaces.

Accordingly, in the early and most remarkable work of HUGO, "Notre-Dame," we have the Paris cathedral assuming the importance of the principal character. The building is more than a background; it combines the principal personages and brings them into relationship with one another. What is more, the novel recalls to us the profuse shedding of blood and the countless tortures which were familiar to the theatre-goers in the Elizabethan age. For many people the novel was a punishment which they were too infatuated to escape. The vivid descriptions made readers feel as if they were spectators of the tortures which were inflicted on QUASIMODO, ESMERALDA and the rest. GOETHE, who was not easily moved, declared that he suffered anguish from reading the pages. He looked on it as an offence to have introduced so much unnecessary suffering in order to exhibit the power of the writer.

That power could not, however, be resisted by the most susceptible of HUGO's countrymen. Immediately a party was formed of Romantics, consisting of the young and ardent writers and artists, and to be a classicist or an admirer of CORNEILLE and RACINE was taken to be a sign of decrepitude. "Notre-Dame" served instead of an oriflamme. The Mediæval buildings which had been neglected were at once prized as treasures which were available for romances, and steps were taken to restore them, or, in other words, to make them more romantic than the builders had left them. Any new churches that were required were, of course, made Gothic in style, and for a time it seemed as if France had at last found her right position by going back to the age of Saint Louis, and forgetting the intervening centuries as if they were nightmares.

In painting there was also a return to the same period by the selection of subjects. Mediæval history supplied innumerable incidents, and the artists sought not only opportunities to display beautiful costume, but to prove their possession of tragic power. THACKERAY, who was a correspondent in Paris when the Romantic movement had lost many of its characteristics, turned statistician in order to count the number of scenes of bloodshed that were visible on the walls of the Salon. The man who is reckoned as the greatest painter of that period was EUGÈNE DELACROIX, and he was more akin to VICTOR HUGO than any of his contemporaries. DELAROCHE in his historical paintings tried to be tragic and refined, and therefore failed.

Anyone who will have any doubts about the influence of VICTOR HUGO on the preservation of Gothic buildings

and their imitation need only glance at a collection of French architectural books which appeared prior to the advent of Romanticism. He will find they were very few in number. The lithographs or engravings were produced in a style which made it evident that the execution was of more importance than the subjects. The descriptions were of the briefest, for nobody cared about the history of the buildings. The works of English travellers prepared the way for admiration of Gothic, but it was not until HUGO and his followers became influential in France that the old buildings were prized as they merited. The Romantic movement, like all other forms of enthusiasm, could not go on for ever, and when its originators turned to other fields for the exercise of their gifts the love of Gothic grew cold. At the present time it has ceased to be the popular style for adoption in new churches, and the variations of late years correspond with the waning of Romanticism.

HUGO was willing to admit his indebtedness to English literature, and his volume on SHAKESPEARE reveals more idolatry than is to be found in any English work on the dramatist. But it could not be said that he became enamoured of modern Englishmen, if taken as a whole, although when he met individuals he appeared to be gracious and grateful. We are so accustomed to adverse criticism from foreigners of all degrees, it is likely to be true that not one English reader has forsaken HUGO's stories, poems and dramas because he was severe in judging English ways. But it would have been more pleasant if a man whose influence with his countrymen was so general could have done us justice. This view of HUGO and his criticism was well expressed by TENNYSON when addressing his brother poet. He wrote:—

Victor in Drama, Victor in Romance,  
Cloud-weaver of phantasmal hopes and fears,  
French of the French, and Lord of human tears;  
Child-lover; Bard whose fame-lit laurels glance  
Darkening the wreaths of all that would advance,  
Beyond our strait, their claim to be thy peers;  
Weird Titan by thy winter weight of years  
As yet unbroken, Stormy voice of France!  
Who dost not love our England—so they say;  
I know not—England, France, all man to be  
Will make one people ere man's race be run;  
And I, desiring that diviner day,  
Yield thee full thanks for thy full courtesy  
To younger England in the boy my son.

However long it may be before Englishmen and Frenchmen are one people, they can still unite in admiration for that old architecture in the creation of which their forefathers bore a part. For aiding in the revival of Gothic, VICTOR HUGO deserves to be always associated with WALTER SCOTT. The French poet, indeed, loved the style not wisely, but too well. It could easily be imagined that he was of opinion it was possible to be inspired by the same spirit which once animated the ancient architects. He cared little for repose, and was always straining after novel effects. He seemed to go to extremes in everything, and, like some of the French builders, sought after difficulties as if for the purpose of compelling surprise and wonder. He imitated Gothic exuberance throughout, forgetting it was only a foil to Gothic severity. He also failed to remember that gloom was an occasional effect, not the prevailing power of the architecture. As a consequence he did not care for simple details, but magnified them beyond their due proportion, and gave them an emphasis which was unnecessary. In fact, much of what is said by opponents of Gothic could be adapted and applied to VICTOR HUGO's writings. But the reader must agree he is dealing with a power that is colossal, although he may often wish it was amenable to discipline, and was less disposed to be wilful in order to display its strength and freedom.

The *Tablet* announces that the "Dupplin Carvings," consisting of 54 cathedral stalls, have been purchased from the Earl of Kinnoull and presented to Cardinal Vaughan for the Westminster Cathedral. The donor has also intimated his intention of bearing the whole expense of fitting the carvings into their place. They originally formed the interior of the chapel of the monastery of St. Urban, near Lucerne.

## NOTES FROM NAPLES.

THE British Consul at Naples writes:—The question of the desirability of the investment of foreign capital in a country may be open to argument, but in the case of South Italy there ought to be no doubt that the influx of foreign capital is an unmixed benefit. The stamp duty on foreign capital shows that in 1881 4,375,000% were taxed, whereas in 1900 the much larger amount of 18,950,000% came under contribution. This capital is largely Belgian, French and German, though a certain amount of it is British, and it is represented by tramways, waterworks, ironworks, gas and electric works, shipbuilding and other enterprises which have been started by foreign capitalists. Some of these enterprises have been extremely successful, and have excited the envy of the natives to such an extent that they are now crying out that the country is being despoiled by the foreigner, who is making money at their expense. No account seems to be taken by these objectors of the fact that these industries all go towards the employment of a teeming population, which, if labour were lacking, might at once become a source of danger to the community.

It will interest intending excavators to know that for purposes of excavation South Italy has been divided into three zones, having their centres at Naples, Taranto and Potenza. This decentralisation will not prove an unmixed boon to the public, though perhaps it will tend to greater care of the relics of the past. That a great deal of excavation might be profitably done in Italy there is little doubt, but it is not work which inexperienced people should take up, or they will certainly find themselves involved in loss and disappointment.

It is strange that with all the interest taken in these provinces, and especially near Naples, in archaeology and exploration no definite chart should ever have been made of the important Roman remains beneath the sea which stretch almost without interruption from Naples to Baia. It has been left to the spirited intervention of the Land and Sea-level Section of the British Association to undertake this, and under their auspices Mr. T. R. Günther, of Magdalen College, Oxford, has been engaged for some months in making a detailed survey of the Roman structures beneath the sea, from which it would appear that the sea-level has risen some 20 feet since those days, and has covered many villas and piers, and probably also a road which seems to have existed along the coast of Posilipo.

It would be manifestly unfair to anticipate the monograph which will no doubt be shortly published by Mr. Günther, and it is enough to say that his survey will be found of great practical value, apart from its scientific interest, because many boats run upon these old foundations annually, and only last year a steam vessel of the Italian Royal Navy struck on the uttermost one. The danger in question is felt mainly by pleasure navigation, and owners of yachts need to be especially careful when running along the coast in steam launches, no fewer than three of these craft having had narrow escapes in recent years. A careful record of the tides was scientifically kept throughout the entire summer, observations being made several times a day. A table of these observations will be published, which will show the rise and fall to be greater than has been usually supposed, and also that the level of the Mediterranean is less influenced by the action of the wind than has been thought by many observers.

The discovery of the bronze statue of a torch-bearer near Pompeii, though made some time ago, has not been noticed in former reports because the Government held back the statue from public exhibition for several months. It is now exhibited in the National Museum and represents a youth holding a bracket for a lamp. The bracket is in a glass case near the statue. The statue is what is known as "boy size," and appears to have been coated with silver, which has in the main perished. A good deal of discussion has arisen as to its period, but in all probability it does not date back further than the first century B.C.

In the disused monastery at Donna Regina, in the heart of Naples, which has now been placed under the control of the municipality on account of the splendid frescoes found on the walls, a number of interesting pictures and works of art have been found which were apparently stowed away there about the time of the taking of Naples by Garibaldi in 1859. All those of historical interest are to be removed to the Museum at San Martino, where the Bourbon relics and many interesting specimens of the arts of Neapolitan provinces, chiefly of the sixteenth and seventeenth centuries, are exhibited.

Amongst the new finds in modern pictures are:—A picture of the Masaniello Riots, by Cammarano, and the Entry of Cardinal Ruffo, by Marinelli. Also a very fine portrait of Garibaldi, with a long autograph and the inscription, "Con amore filiale." There is also a bronze statue of Ferdinand II. in Roman dress, by Pietrarsa, and a plaster cast of Carlo Marconi, who, it will be remembered, was visited by the late Mr. Gladstone when in the political prisons of Naples in 1848.

There are also pictures of local scenes and places, by Giganti and Mancini, of considerable historical value.

The complete modernising of the fine marine palace (Palazzo Donn' Anna) which was begun 300 years ago by Donn' Anna Carafa and never finished, will cause great regret to the lovers of the many romances belonging to the Bay of Naples. The ruin had become the dwelling of several fishermen and other poor people, while three restaurants had established open-air dining-places within its precincts. At one time the tramway horses were stabled there, but in spite of all its many degradations it still stood a magnificent ruin, the delight of artists, with the bright waves washing into its deserted arches, and the spot round which many writers on Naples, and notably Dumas père, had hung many of their most thrilling episodes. It has now become the property of a French gentleman, who is renovating it throughout and will make it into residential flats.

A notable expansion in the direction of new hotels is apparent at Naples. Although nothing further than a reservation of the site seems to have occurred in the case of the Hotel Splendide, which was to have been completed in 1900, an adjoining site has been taken up by Signor Campione, upon which he has erected the Hotel Santa Lucia, the shell of which was completed in August last. There is every probability of its being opened next summer. Its situation opposite the Castello dell' Ovo is very fine.

The Brothers Bertolini, whose hotels in various parts of Italy have earned them a well-deserved reputation, have purchased a large building recently erected by Mr. Lamont Young at the top of the hill overlooking the west end of the city, and have joined it to the Corso Vittorio Emanuele by a lift, thus minimising the inconvenience of its extreme altitude. The lift is reached by a tunnel from the street about 50 yards long into the heart of the mountain, whence the lift rises straight up through a shaft cut in the tufa rock to a height of some 300 feet, occupying about two minutes in the ascent. The lift is a very large one, capable of holding sixteen people at a time, and is driven by electricity.

The Eden Hotel, just built by a French gentleman, is in the Piazza Balsorano at the west end of the town. It is a lofty and commodious structure, and has a pretty garden in front of it. It will be under the same management as the Hotel Bristol on the Corso Vittorio Emanuele.

The Savoy has also recently been opened by Signor Rossanigo on the Caracciolo Embankment. This is a very complete building, facing due south, and having the attraction of a spacious winter garden is sure to be a favourite.

A considerable number of pensions have also sprung up to cater for the wants of economical travellers, and against this vast increase of accommodation only one important hotel, the West End, has been closed. This hotel had its view built out and consequently declined in popularity.

## CHRIST'S HOSPITAL.

THE award of Lord Balfour of Burleigh has been announced in the case of the "Governors of Christ's Hospital and the Governors of St. Bartholomew's Hospital," heard by him as the sole arbitrator in January last at the Surveyors' Institution, Westminster. This was a claim for compensation in respect of 67,680 square feet of land adjacent to St. Bartholomew's Hospital, and forming the back portion of the well-known Newgate Street estate, which covers approximately five acres altogether. His Lordship heard the evidence of Alderman Sir John Whittaker Ellis, Mr. W. H. Elwell, Mr. E. H. Bousfield and Mr. A. R. Stenning for the claimants, and of Mr. Samuel Walker, Mr. C. A. Lang, Mr. Robert Vigers and Mr. Edward Tewson for the promoters. His award is that the Governors of Christ's Hospital are to be paid the sum of 238,781%.

## SUBURBAN LIVERPOOL.

BETWEEN Hoyslake and West Kirby, which together form one of the newest suburbs of Liverpool, says a correspondent of the *Liverpool Post*, there is a long road bordered by suburban houses which forms a remarkable object-lesson. All the way along, from the older end to the newer, there is a steady improvement in design. Some of the newer houses in this neighbourhood have been designed by our fellow-townsmen, Mr. Edmund Rathbone, who has from the point of view, not of an aesthete, but of a practical, businesslike architect, made this matter of home-planning a special study. He has achieved marked success. Houses, externally without exaggeration or pretence, which form pictures of bright cheerfulness and homelike charm, equally presentable from any aspect, back or front, the walls beginning to be tapestried with flowering creepers, the windows cosily curtained, the warm-tiled roofs harmonising with the grey English sky, are approached

through trim and elegant formal gardens, which extend all round the dwelling, terminating, perhaps, with a tennis court at the rear. Each house has its individuality, honestly and well built as the permanent residence of a family moderately well-to-do. One of the most recently designed of these houses affords an excellent illustration of that interior architectural treatment already spoken of. The house, being detached, has no back and front in the ordinary sense, since each side of it is a presentable front of itself, but the entrance, approached by a tree-bordered drive, is on the side of the house furthest from the road, both as being most sheltered and as not interrupting the views of the Dee and the Welsh hills. The access leads through inner doors to a cosy hall, which has a fireplace, and opposite to it a fixed seat. In this hall is placed the staircase—the house being one of two storeys only—lighted by three windows. The hall and staircase are panelled right away to the roof, with wood stained and varnished a beautiful dark tone, something between green and blue. The pillars supporting the staircase are used as pedestals for electric chandeliers, bearing shaded lamps designed to shed a warm and grateful glow. The architectural effect is achieved not merely by the panelling, but by symmetry. On the ground floor are four doors. Those on either side of the fireplace, which is finished with beaten copper and has above it a coloured panel in relief on the subject of "Spring," lead respectively to the drawing-room and dining-room; the doors at either end of the hall give access, one to a breakfast-room, with a pleasant south-eastern aspect, and the other to the offices. The doors are panelled and stained to correspond with the wall panelling. The dining-room and drawing-room are each treated individually, the wall-panelling leading to a cornice which supports the ceiling, slightly arched at the edges so as to give an effect of convexity and avoid harsh lines. In the centre of the ceiling in each apartment is a group of electric lights under a reflector of burnished copper, which imparts a warm quality to the illumination. The panelling of the dining-room has been treated in a tone of myrtle, which shows the graining of the wood, and that of the drawing-room in a delicate shade of mauve. Each room has a wide bow window, not of the square or half-hexagon, but of the arc shape. In that in the drawing-room there is, for the whole width, a cosy window-seat. Between the rooms are doors which fold back on hinges, and fit into recessed spaces, so that when opened the apartment appears to be one. The dining-room has a fitted sideboard in an arched recess, and there is provision for service and communication with the kitchen without bringing in food and crockery through the door. Each room has a slow combustion well fireplace, with beaten copper furnishings, to obviate the necessity of relighting fires. One feature of a modern artistic house is the absence of unnecessary furniture, which involves unnecessary labour. As a rule people overcrowd their rooms and destroy that effect of cheerful repose which is the object of all domestic arrangement. Both these apartments, though of moderate size, are light, beautiful and important-looking. The varnished panelling is not only remarkably warm and cheerful, but cleanly and economical, there being no necessity for painting and repapering. On the contrary, the panelling improves with age. The same treatment of wood-panelling is carried throughout the sleeping rooms, each being treated in an appropriate tone of some light scheme of colour. These sleeping-rooms, seven in number, all open off one well-lighted landing, panelled in the same manner as the staircase and hall. That great desideratum, complete separation of the domestic offices from the rest of the house, is here successfully attained. There is a fully-equipped working kitchen, with the usual scullery adjuncts, and opening off it a cosy servants' sitting-room. Altogether both plan and treatment are a marked advance toward the ideal of unostentatious refinement, combined with substantial comfort, which reflects the best English taste; fitted, as far as art and skill can make it, to be the place of refreshing beauty, quietness and rest, which vindicates the name and fulfils the praise of home.

#### LEIGHTON AND MILLAIS.

A CORRESPONDENT of the *Times* writes:—  
Lord Leighton was honoured by the unveiling of a magnificent memorial, placed in a most distinguished position on the floor of St. Paul's, where it rivals that to Wellington, and dwarfs that to Gordon in the adjoining bay of the nave.

The grave of Millais, the greatest artist of the Victorian era, is recognised only by an inconspicuous slab on the floor of the ill-lighted crypt, to which admission can only be obtained on payment of a fee. He has not even been accorded the distinction such as has been given to minor artists of his time—for instance, Frank Holl or Randolph Caldecott—in the form of a memorial on the walls by a sculptor of note.

What is the reason for this? What has the Royal Academy, of which he was president, the artists who learnt so much from his example, the multitude of his friends, the sitters who were

immortalised by him, and the world-wide public which derived more pleasure from the enjoyment of his pictures than from those of any of his contemporaries, to say to this?

Perhaps some worthy memorial to his genius may be in course of construction, but if so it is strange that its being so should have been unknown to so many who attended the ceremony, and who, like myself, had the privilege of being a friend of both.

To this letter Sir E. J. Poynter replies, and suggests that the "friend" should send a subscription to the Millais memorial.

#### LECTURES ON SCULPTURE.

IN his opening lecture on sculpture to Academy students on the 17th inst., Mr. A. Gilbert, R.A., said that last session he dwelt on achievement. He had figured it by a flowering tree, believing that this would hold their attention, as he had promised at a future time to begin at the root, for in a short course it was difficult to give practical teaching. He wished to put before them what they should attempt to do. Their individual feeling would tell them what they ought to do. And by laying stress on endeavour he could make the best use of technical points, eschewing didactic ones, for guidance was the only weapon with which a professor could attack his hearers. He referred, says the *Standard*, to the loss of two great artists, either of whom would be fitting punctuation of his text—"Endeavour." One an old man who, perhaps, could recollect Trafalgar, steadfast to his own ideal, a perfect artist according to his own lights—Sidney Cooper. The other his work finished yet still achieving, a man loving and beloved, in whose work they would find all that was meant in the title word of the lecture—Onslow Ford. The title word did not signify mere plodding, but was that curious faculty in human nature which "waits upon"—i.e. the hand maiden of—success. Achievement was what, after all, one might never live to see. Rembrandt was asked when a picture was finished, and he answered, "An artist's work is finished when he has done with it." Cooper was contemporary with Turner and others, before whose works the students would go on their knees, but sculpture of the period was pseudo-Classical evidence of great learning was deemed all important, and the nearest imitation of Græco-Roman art was thought the best. By Gibson's example a kind of school was created with a creed that the Classic should be accepted without question, and was sad that this style would be known as Victorian sculpture. Gibson broke out, it is true, by bringing forward polychrome sculpture, which he brought from abroad, for he was not the inventor of it, and in regard to this the students must remember that art is free, and they might do what they pleased. Sculpture was in a parlous state when Onslow Ford set out, and, not knowing what road to follow, he went to Antwerp, then thought the best school, but Mr. Gilbert earnestly asked his hearers to accept his word that the Academy schools are more up to date than anything abroad, and he warned them not to go and study in a country quite foreign to their own natures. Antwerp professors had but one idea, namely, that nothing was to be regarded that was not actually seen, and everything was built on blind tradition, any who broke from it being looked on as black sheep. Ford rebelled against such teaching, and went to Munich, where he found quite a different element, for although there was study of reality, there was also that ting of hidden poetry inherent in true Teutons, but lacking in the mixed race of Belgium. Wagnmüller's sculpture, surprising examples of surprising things, were something more than realistic, for they had *esprit*, observation and character. Ford, seeing them, was influenced thereby, and his career could be traced by them. Ford had said his last say, but that say would be echoed by posterity if not by the present generation. Contrasting the two lately deceased Academicians, Mr. Gilbert said the sculptor's nature was lamb-like, and he made giants; the painter painted lambs, but was a giant. By future lectures dealing with creation, and showing the difference between chance composition and will composition, he should prove that the words he had uttered were not empty ones, and he wrote on the blackboard a line of Homer which would act as the basis for those lectures. A free translation of the line was, "Always strive after the best," but the characters of the original would show the Greeks were artists not only in sculpture but in writing. Sculpture, he reminded them, was a very exacting art, its disappointments were great; the ladder of success was narrow, though there was plenty of room at the top, but when this is reached they might come to the bottom again, and again have to begin the scramble. Nevertheless, though the British school was young, it was going ahead and was full of vivacity.

In his second lecture Mr. Gilbert said to accomplish was the outcome of industry, perseverance and self-control. Study was the A B C of their art, by which they learnt to attempt to accomplish, but he took it they would not be there at all unless

n intellectual birthright gave them a calling towards the sculptor's art. By delving they would in time accomplish. To aid his precepts he made a diagram of a tree whose roots were romance and poetry; the greatest girth of its stem represented intellectual accomplishment, which merged into idealism. Above this was a label that stood for schools, on either side of which were boughs weighted with realism and mannerism; branching above this were individuality and self-control united by a seed vessel called style, and this bore the opening bud of achievement which, when more fully expanded, became creation. Realism and mannerism would give mere mountebank results, and true sculpture was essentially an expression of individuality. Above all must the students be true to themselves and to nature, but regard her intellectually, remembering that she had poetry. An ugly model should be accepted as an exercise only, and in studying one with some uglinesses they should note all, but dismiss from their minds everything but the beautiful points. Mannerism or fashion was a great stumbling-block, for it was natural to be struck with what at exhibitions won public applause, and to copy it without remembering that they had neither the art nor the heart of the original artist. He had done so himself in his youth. When mannerism once seized a man it was very difficult to shake off. Mr. Gilbert had noted the expert manipulation, the limbleness of finger in the schools, but as he was speaking as a guider rather than as a teacher, he felt bound to say he did not see similar attention given to subject and design. Blake, he said, was in essence more of a sculptor than any man had ever been, except Flaxman, for the great mind was always bringing forth something. Choice of subject was very wide, and could be a primary object, or the work would be like a poor actor speaking indifferent lines of an inconsiderable author. Technique was more imperative than to a painter, as he could always change his colours, but a sculptor's colours were confined to light and shade, his only other aids being line and form. Mere imitation of ornament by undercutting, such as vases, flowers, &c., of modern Italian work had none of the solid, majestic quality true sculpture demanded. Goldsmithery as different; its license was unlimited, its mission was to please; it was a toy. The first thing to consider in designing sculpture was whether it was for indoors or outdoors, monumental or ideal, as this would determine its treatment. There were two kinds of design, accidental and willed, and he would insist that they should give most of their love to the willed, as he saw work in the schools that smacked of flukes such as evolved on the blackboard after flinging a sponge of colour against it and using the accidental mark as basis of a design. On the next occasion he would say much about creation, for to create was not the same as to make something. And in this connection he alluded to the remarkable creative powers of Claude Lorraine. Nothing was chanced, nothing fluked, everything was filtered out of his observation, and he never pandered to fashion and commerce—he was not a mannerist. Flaxman certainly was a mannerist, but not commercial; he had not the advantage of studying the Elgin marbles, and the Roman-Græco things by which he was trained, though admirable in their way, were not the highest expression of sculpture. Study of the antique was good training, because it was approached as being the beautiful ideal of great artists, and unconsciously, intuitively, the student absorbed effect-of-will-design, beauty of line and proportion. The really true was nearly always ugly, and as the students grew older they would find truth was most disagreeable. If truth was ugly they must lie for all they were worth, and thus give truth the lie. They must leave nothing behind them of which it could be said the artist was a great sculptor with ugly ideas.

### NEWPORT VICTORIA MEMORIAL.

A MEETING of the Queen Victoria memorial committee of the Isle of Wight was held at Newport on Saturday afternoon under the presidency of the mayor (Alderman F. T. Hew, J.P.), to consider designs for the erection of a memorial at St. James's Square, Newport, at a cost not to exceed 1,000£. A premium of 25£ was offered for the accepted design. About 15 drawings were sent in, and the committee's recommendation that "Vectis I." be adopted was agreed to. The Mayor stated that the Royal Governor, Princess Henry of Battenberg, who had inspected the designs, entirely agreed with the selection. The author of the plans was Mr. Percy Stone, F.S.A., of London, who wrote:—"In submitting a design for an I.W. Memorial to Her late Majesty the Queen, I would suggest that such a memorial should be graceful rather than substantial, that as a monument to the memory of a great Queen and as an appropriate form for the site it is to occupy. Any bulky superstructure would block the general view of the market place and fail to group with the surrounding buildings. My idea has been to design what may be appropriately called a Victoria Cross. The figures at the base of the column represent the great virtues of Dignity, Fortitude and Sympathy upholding

the crown and guarded by the lions of England." It was stated that the height of the monument would be 36 feet. The carrying out the work was left to a sub-committee.

### CAERWENT EXPLORATION.

THE excavation committee have produced a report of the work carried on at Caerwent in 1901. The work of the year has consisted mainly in the excavation of the west wing of House II. and of the whole of a large house, and in opening out the North Gate and in excavating the field to the south of it. A curious passage or culvert of massive stone slabs leading down to the gate has been uncovered. The field adjoining the gate contains several buildings, the excavation of which is nearly completed. The two houses (II. and VII.), of which complete plans and detailed reports have been presented to the Society of Antiquaries, were of unusual interest. They were both large houses of the courtyard type, but they differed from the type commonly found at Silchester in having suites of rooms arranged round all four sides of the central court, whereas at Silchester the courtyard type of house usually has rooms on three sides only. In House II. a large hypocaust was found in which the pilæ, each formed of a single stone, actually rested on a tessellated pavement (still intact) of the earlier house. A portion of the hypocaust has been removed and re-erected in the temporary museum. The other most important features in this house were a channelled hypocaust and a series of small baths, in one of which the leaden drain-pipe was still to be seen as it passed through the wall. In House VII. the chief features of interest in the house itself were a small, partially-detached building, which may have been a shrine, and two rooms which contained a fine tessellated pavement, in which were busts of the seasons and figures of animals and of cupids. Underlying this pavement, which was of late and inferior workmanship, was another (of the earlier house), constructed with far more care as to detail and finish. In both these rooms the walls were standing to a height of nearly 3 feet above the floor-level, and the plaster on the walls, was nearly intact. It was therefore fortunately possible to recover to a considerable extent the colour and design of the wall decoration. Among the various objects found, perhaps the most interesting was a small plaque of thin bronze, containing in high relief a female head. It is hoped to resume work early in this summer, but the funds raised last year have all been expended, and it will be necessary to raise a large sum—at least 300£.—to enable the committee to complete the excavation of the nine acres already in their occupation. Subscriptions for this year should be sent to the hon. treasurer, Mr. A. E. Hudd, F.S.A., 94 Pembroke Road, Clifton, Bristol.

### EDINBURGH ARCHITECTURAL SOCIETY.

At a meeting of the above Society, held on the 19th inst. in the rooms of the Association at 117 George Street, Mr. H. F. Kerr, president, in the chair, a lecture was delivered by Mr. W. G. Burn-Murdoch on Scottish history from early times to the Union of Scotland and England. The principal historical figures during that period were touched upon, and notice taken of the changes in the arms and costumes used in the times of the various monarchs who reigned over Scotland, as well as many of the outstanding events which had occurred. The limelight views took the form of the historical design proposed for the new municipal buildings in Edinburgh. Previous to the lecture it was, on the motion of the Chairman, remitted to the committee of management to consider and report as to the desirableness of affiliation with the Royal Institute of British Architects. Mr. James Bruce, W.S., gave notice of the following motion:—"That the Association should approach the Carnegie Trust with a view to establishing a chair of architecture in the University of Edinburgh."

### RENAISSANCE ARCHITECTURE OF SCOTLAND.

A MEETING of the Glasgow Technical College Architectural Craftsmen's Society was held on Friday evening, 21st inst., when Mr. Thos. S. Fraser, architect, read a paper entitled "The Renaissance Architecture of Scotland." Beginning with the various causes which led to the Renaissance movement in Italy at the end of the fifteenth century, the lecturer traced its progress through the different countries of Europe. By numerous lantern views he showed its gradually increasing influence on the castellated architecture of Scotland and its final ascendancy over that style in the eighteenth century. He then referred to the literary and artistic eclecticism at the beginning of the nineteenth century, and concluded with more favourable opinions of the tendencies of modern architecture and its advancement along with present-day requirements and inventions. A hearty vote of thanks was accorded the lecturer.

### NOTES AND COMMENTS.

THE Wolverhampton Exhibition which is to open on May 1 will be of peculiar interest for all who are connected with practical engineering in any form. The scale on which the exhibition is planned is creditable to the enterprising town. But the people realised that it was incumbent on them to uphold their reputation in the Midland district. The grounds and buildings will have an area of over 30 acres. The main buildings will occupy 127,215 square feet, and in addition there will be other buildings which will cover about 30,000 square feet. These figures are exclusive of the area required for side shows. There will be seven groups, all having some relation to the Midlands. They will comprise raw materials, agricultural machinery, mining, industrial design and manufactures, motive powers, electricity, labour-saving appliances, lighting, heating and sanitary appliances, locomotion and transport by land and sea, science and scientific instruments, education and music, sport and sporting appliances. The names of the firms who have already sought for space are all prominent representatives of the manufacturing world. There will also be attractions for sightseers, but the principal interest of the Exhibition will arise from the value of its industrial exhibits.

THE question of restoration is a many-sided one in Scotland. There are several rights of heritors and other classes of parishioners which have to be taken into account. As the law in the North as well as in England is no respecter of archæology, the suits which arise are not always easily settled. One late example is the cathedral of Brechin, which was lately restored under the direction of Mr. HONEYMAN, R.S.A., at a cost of about 12,000/. The building was used as a parish church, and the seatholders profess to be aggrieved by the alterations. They say that the restoration was not required because the building was out of repair, but on archæological, æsthetic or sentimental grounds. A committee of subscribers had taken up the work, and had guaranteed that the church should be restored to at least as fit a condition for the conduct of public worship as it was then in, except as regards sitting accommodation; that thereafter the roofs and whole interior fittings of the church were completely removed, and with the exception of the nave arcading and gables, which formed part of the fabric of the ancient cathedral, the entire masonry of the church was dilapidated and removed, and the church was re-erected on an entirely different plan; that the church as thus reconstructed is now ready for occupation, and that it contains a considerably less number of sittings than were allocated or possessed in the former building. The last allocation of seats took place in 1807, and so long a term gives the holders or their representatives a right to the accommodation then obtained. The Sheriff of Forfar who heard the case has come to the conclusion that the church in September 1899, when the restoration was agreed on, was then in a state of good repair, and cannot now be considered as a new structure, and that the rights of the parties to the same proportion of the area of the church continue unchanged. His Lordship therefore has expressed disapproval of the scheme of division which became necessary in consequence of the restoration, and has ordered that a scheme or table should be prepared of the sittings, allowing 18 lineal inches for each sitting, and, after setting aside seats for the ministers and officiating elders and for the poor, setting forth the number of sittings to which the heritors or others are entitled, the apportionment of said sittings being regulated by the division and apportionment thereof in the former parish church. No one cares to see an invasion of rights even in a church, but under the circumstances the congregation, and especially the representatives of the people belonging to the church in 1807, might have accommodated themselves to the new arrangements in which the convenience of the congregation was studied as well as archæology, æsthetics and sentiment.

A GREAT many excellent people believe they have a mission which can only be accomplished at the expense of their neighbours. The Housing of the Working Classes Act has given to them an unequalled opportunity for the display of their fervour. They want wholesale clearances

in towns, and so long as they are satisfied it matters little to them where the money for the purchase of property, the preparation of sites, and the erection of mansions with modern conveniences is to be found. The borrowing power of municipalities are presumed to be inexhaustible, and can be paid back by levies of small fractions of a penny. Mr. A. J. BALFOUR was therefore right when he said: "There is some danger at the present moment that the housing question will fall into the hands of emotive rhetoricians, whose well-meant advice can by no possible benefit those whom they desire to serve. There is nothing in the world so easy as to string together harrowing descriptions of overcrowded rooms, and insanitary surroundings, and there is nothing in the world so useless. Indeed, the public conscience required to be stirred on the great subject appeals like these might be useful and even necessary; but the world has moved far beyond the state of indifference, and what we now require is not sentiment but science, the unbiassed investigation into the economic and social facts from which evils of overcrowding spring into the remedies which have been already tried, and into any new ones which seem likely to be effective." An instance of the kind is at the present time under the consideration of the City Council of Birmingham. A dozen people who, like the three tailors of Tooley Street, claim to represent all Birmingham, have denounced an area in St. Laurence's and demand an improvement scheme. The housing committee of the Council have visited the area so condemned, and they report that it comprises one church, one chapel, one Board school, one voluntary school, eleven works, 589 dwelling houses and eight public-houses. The streets on the area vary from 30 to 60 feet wide; the Birmingham Canal which is about 35 feet wide, passes through the area for a distance of 172 yards. The Board school playground is 1,328 square yards in extent, and the open spaces in the courts amount to nearly 2½ acres. A calculation put forward by the committee shows that out of the 14½ acres there are about 8 acres not built upon. To realise the aspirations of the philanthropists would need an outlay of nearly a quarter of a million sterling, and would involve the destruction of many houses that are thoroughly fit for human habitation. In this case, if instead of wholesale demolition imperfect houses were removed, a great sanitary improvement would be attained. But so long as people who are supposed to have the monopoly of sympathy for the poor cannot apply the principle of the clean slate in a city or town, it will be believed that public authorities have failed to do their duty.

### ILLUSTRATIONS.

ALL SAINTS CHURCH, WEST BROMWICH: MARBLE MOSAIC PAVEMENT.

DURING the last few years the chancel of All Saints West Bromwich, has received important additions. In December 1898 an organ was introduced. Afterwards a carved oak case was added. It contains much elaborate work, including figures of angels with trumpets, besides delicate tracery. The carving and other work was executed by Mr. ADSENT HANSTONE. The oak chancel screen measures 26 feet 3 inches by 15 feet, and, like the building, is Late Perpendicular in style. Figures of angels are introduced on detached pedestals. The screen is the gift of Mr. CHARLES LEES, and is the work of Mr. BRIDGEMAN, of Lichfield. The iron gates, which are an important feature, were wrought by Messrs. HART, SCOTCHPEARD & Co., LTD., of London and Birmingham. The groups of figures in the stall ends are intended to illustrate the saintly life as set forth in some of the occasional offices of the Book of Common Prayer. The subjects are suggestive of Home Catechising, Worship, Public Catechising, the Ministry, the Kingly Office, Ministering to the Sick, Churching of Women, the Lord's Supper, Matrimony, Confirmation, Baptism, Prayer, Ministration of Angels. The designs were prepared by Mr. ENOCH WOOD, of WOOD KENRICK, architects, West Bromwich and Birmingham.

NEW PREMISES, LEICESTER, FOR MESSRS. FAIRBROS.

FOOT'S CRAY PLACE, FOOT'S CRAY, KENT.

THE QUINTA, ALDERLEY EDGE, CHESHIRE.

# THE HISTORY OF THE ROSARY.\*

THOUGH at the present day some justification will seem necessary for inviting the attention of the members of Society of Arts to such a topic as the History of the Rosary, I think, in the Middle Ages, have been taken as a matter of course that there was no organisation to which subject so naturally belonged as that which dealt with application of the arts to matters utilitarian. As we learn from the elaborate work on the art and craft associations of the compiled by one, Stephen Boyleau, as early as the year 1370, the *patenôtriers*, the makers of paternosters or rosaries, constituted a most thriving industry, which, even at that date, was divided into four different guilds or companies, distinguished seemingly according to the material in which they worked. The first were artists in bone and horn, the second in coral and mother-o'-pearl, the third confined themselves to amber and jet, while the fourth were a more miscellaneous association engaged largely in metalwork and the manufacture of buttons, buckles and rings.

In England the rosary makers do not seem to have been so specialised; and yet in the London municipal records of the same period we not unfrequently find citizens described as "patenosterers," and there can be no doubt that their trade principally consisted in the turning, polishing, perforating and stringing of beads for devotional purposes. We have record, for instance, of an inquest held in 1278, in the reign of Edward I., in the ward corresponding to that now called Argon Street Within, at which three of the witnesses were "patenosterers." They were evidently neighbours, and it seems probable that they all resided in Paternoster Lane, as it has been called, which, you will notice, lay just under the shadow of the great cathedral, and in the devotional centre of London. The craftsmen themselves lived in Paternoster Lane, but I am inclined to think that their wares were largely sold by the persons called "stationers," so styled from the fact that they were allowed to occupy certain "stations," or "stalls," as a modern itinerant vendor would say, around St. Dunstons Cross and the cross in the Chepe. The stationers did not content themselves with selling objects of piety; they dealt in all things that were needed by the "clerks" or ecclesiastics, and also naturally congregated around the great cathedral, where, in want of the pens, parchment, ink, copies and *etc.* manuscripts, which formed part of the stationer's trade. The stationers have clung to their old position, and still predominate in the Row, along with the dealers of pious statuary, holy-water stoups, and other objects. There was also another Paternoster Lane in the thirteenth century. It lay beside the Thames in the Vintry, and close to the church thence called the Paternoster Church, or St. Michael's the Royal. This was the quarter inhabited by Gascon vintners, who shipped their wines from the town of Bordeaux, near Bordeaux. It was natural that they should have objects of devotion in forms familiar to them, and we may assume that French paternosterers settled there to supply the demand. We find the same industry flourishing in all great cities. In Rome there is still a street near St. Peter's called the Via dei Coronari—a *corona* is only a variety of paternoster or rosary—and we have abundant references in documents of the fourteenth century to the "patenosterrari," who established their booths in the region of the Vatican. Of these the *patenosterrari* sold many other miscellaneous wares, but devotional, besides rosaries, but the very existence of the industry in so many different countries shows that the production of these *fila* or *numeralia de Pater Noster*, strings of beads to count the repetitions of the "Our Father" upon, was of commercial importance. Furthermore, as we shall see, the artistic skill spent in the manufacture of some of these objects of piety, and in furthering the spread of the devotion, was of a very high order. But before we can deal with the artistic aspects of the subject we have to travel a long way back to times and places far remote, for it would be a great mistake to suppose that the use of beads for reciting prayers was peculiar to the Catholic Church, or was of comparatively modern date.

More than one of the French cathedrals, as, for instance, Amiens and at Limoges, we may find representations of the Virgin Mary, in which she is shown reciting her beads as the angel salutes her. To the present day the people who only use beads to help them in reciting their Aves, that is to say, "Hail Marys," the rosary in the hand seems a grotesque example of the Mediæval legend of historical verisimilitude, but the detail is not so without excuse as might appear at first sight. After the use of rosaries was a practice common to many races long before the coming of Our Lord, and although there is no evidence of its occurrence among the Jewish people, it seems to be, at least, a trace of its appearance in the East, with which, of course, since the Captivity, the Jews

came in contact. A paper by the Rev. Herbert Thurston, S.J., read before the Art Section of the Society of Arts.

maintained considerable intercourse. Sir Austin Layard, in his "Monuments of Nineveh," has figured a bas-relief which, according to the description appended to the plate, represents "two winged females standing before the sacred tree in an attitude of worship; they raise the extended right hand, and carry a garland or rosary in their left." My friend, Father Strassmaier, who speaks with authority on such matters, tells me that he is not entirely satisfied as to the meaning of the circlet seen in the picture, and that he is not acquainted with any confirmatory evidence which would establish the use of prayer-beads among the Assyrians; but the details of the bas-relief are highly suggestive of an attempt to represent some act of devotion, and the interpretation of the chaplet as a rosary is at least probable. Without attempting to settle the matter, it may be noted that the carving probably belongs to the eighth or ninth century before Christ.

Passing to the Far East, we come across a number of representations of different deities, many of whom, like Brahma, Siva, the Japanese Amida and the Chinese Kwan Yin, are commonly represented with rosaries in their hands.

It is possible that some of these can claim a more venerable antiquity than 900 B.C.; but it is, I understand, by no means easy to determine with any certainty the dates of Brahmanist and Buddhist antiques, and there is also difficulty in distinguishing the necklaces or strings of jewels often looped around the arms, wrists and shoulders of these statues, and the rosaries proper intended for instruments of devotion. There seems to be no mention of the rosary in the Vedas, and, indeed, the traces of its first appearance, whether in Brahmanist or Buddhist literature, are said to be vague and unsatisfactory. It was stated by Mr. Taylor, when lecturing here on Oriental rosaries in 1873, that the rosary was obviously in use among the Hindoos long before the introduction of the Buddhist religion, and we admit that, on the whole, the theory is plausible.

And now, coming to the rosary as used in the Catholic Church, I must begin by expressing my disagreement with the view adopted by Mr. E. B. Tylor and many others, that the devotional exercise was simply imitated from the Mohammedans and introduced into Western Europe through the Crusades. That the suggestion could not possibly have come to Western Europe through the Crusaders, who had, no doubt, many opportunities of watching their Moslem foes piously using their *subha*, would be too much to say. But it is certainly most important to note that the first undoubted mention of the use of beads for counting prayers in the West, to wit, in the instance of the Lady Godiva of Coventry, the wife of Earl Leofric, is anterior by several years to the preaching of the Crusades. The lady bequeathed to the monastery founded by her "a circlet of gems which she had threaded on a string, in order that by fingering them one by one as she successively recited her prayers she might not fall short of the exact number." Lady Godiva died before 1070, and this clear and specific statement rests upon what is practically speaking contemporary authority.

But besides this definite evidence of fact, it seems to me that the duty of repeating the same prayer a large number of times, often amounting to more than 100, must inevitably have led spontaneously to the adoption of some contrivance for keeping an accurate record. Not to speak of certain early monks of the desert, it is recorded of St. Godric, an English saint who died in 1172, that he used pebbles to count his prayers, though we have not the same clear evidence in his case that he strung them on a string as we have for Lady Godiva. In all the early religious orders, which, like the Carthusians and Cistercians, admitted lay-brothers, the duty of reciting the psalms and lessons of the Divine Office in choir was replaced for the illiterate by that of saying the Lord's Prayer a definite number of times. The number 150, which is that of the Psalms, was regarded in some sense as specially consecrated by tradition. Just as the Psalms were divided into fifties—so much so that the recitation of two fifties or three fifties in Latin or Irish or Anglo Saxon was a common form of penance—so it was natural that fifty "Our Fathers," or twice or thrice fifty, should be enjoined as a penance or exacted as a suffrage for the dead from those who could not read. The constitution of the Knights of St. John, founded in the twelfth century, required as we learn from a bull of Pope Lucius III. in 1185, that the knights who were not clerks should say 150 "Our Fathers" each day. Their paternoster, which, in this case, was literally employed for the saying of the Lord's Prayer only, remained always a part of their equipment. It may be seen in the hands of their Grand Master on the title-page of Caoursin's "History of Rhodes," and it is lavishly used as an ornament upon the tombs of the Knights in St. John's, Valetta.

This duty of reciting the "Our Father" a considerable number of times, and nothing else, in place of the daily office, was practically universal for all monks and religious who had not sufficient education to learn the Latin psalms. Even in the case of the Dominican and Franciscan friars, who were

founded at the beginning of the thirteenth century, we hear nothing in their primitive rule about the "Ave Maria," or Hail Mary. The Dominican lay brothers repeated the "Our Father" alone, as their daily prayer of obligation, until the year 1266. It is easy to understand, then, how the strings of beads used for counting came to be called "paternosters." The name still survives in English in the vocabulary of fishermen to denote a number of hooks set at regular intervals along a line, and it seems also to be known in architecture and heraldry. In the sense of prayer-beads it existed in every European language during the Middle Ages; neither does the primitive signification connecting it with the Lord's Prayer seem to have been entirely lost sight of. I hope to show you a lantern slide of a curious woodcut in the "Speygel der Dogede," a book printed at Lübeck in 1485, in which Our Lord is represented teaching His disciples the "Our Father," and holding in His hands a pair of rosary beads.\* These paternosters were, no doubt, of very various length, consisting sometimes of ten, sometimes of fifty, sometimes of 150 beads, but for the longer varieties it must obviously have been found a convenience to divide the beads by markers, as is the case in the Oriental rosaries, notably those used by the Mohammedans. This might be done either by introducing a new bead or knot, or token of some kind, at the end of each ten, or by making each tenth bead larger.

One of the earliest representations of a rosary which I am able to cite is taken from the incised tombstone of a knight-templar, dated 1273. There can be little doubt that the paternoster he carries was used to count the "Our Fathers," which he was required to say by rule. We find it accurately divided into nines, each tenth bead being a big bead. Other early paternosters are divided by big beads inserted after every five—again, as I believe, for convenience of counting, and the fact that these larger beads were called in French *seigneux* (markers) seems to indicate the purpose for which they were introduced.

And now we pass from the paternoster, properly so-called and used only for saying the Lord's Prayer, to the Rosary of our Lady, the only rosary, practically speaking, now used by Catholics, and the one which, by a widely received tradition, is connected with the founder of the Dominican order. Of the controversy regarding the origin of this devotion, this would not be the place to speak. I am only attempting here to treat the archaeological and artistic side of the subject; but it will be well perhaps to explain that in this form of prayer, which has also from a very early period been called our Lady's Psalter, the Hail Mary is repeated 150 times—the number of the psalms—though for convenience sake this number is divided into three sets of fifty.

So far as my researches enable me to judge, all these arrangements of fifteen definite mysteries are comparatively late, and do not occur at an earlier date than the last quarter of the fifteenth century. The earlier and more widely accepted practice was to assign an incident of Our Lord's life to each of the fifty Hail Marys, and to add some little clause commemorating the incident to the words of the Hail Mary itself. This practice, I venture to think, must have had a considerable influence upon the art of the wood-engraver at the time of the Renaissance. With the introduction of printing a very large number of rosary books were produced, meant for the most part as aids to the devout to help them in their meditations. In the more sumptuous of these a different woodcut is provided for each of the fifty, or, as the case may be, for each of the 150 Hail Marys. The range of subjects extended from the conception of Mary to her death and coronation, and included, of course, the whole of the life of Christ. In this way a number of gospel scenes came to be treated which are of very rare occurrence in art at an earlier epoch, and the variety thus introduced must have done something towards the deformalising and deconventionalising of the treatment of gospel subjects. One of the most elaborate of such rosary-books is probably that of Herman Nitzschewitz, which was undertaken at the command of the Emperor Frederick III., was printed at the Cistercian monastery of Zenna, in the diocese of Magdeburg, and dedicated after Frederick's death to the young Maximilian. The woodcuts, of which there are a large number, are often grotesque and extravagant, but they are decidedly interesting to the student of religious art and symbolism. Each Hail Mary is illustrated by a scene from the gospel, in which is inset a very minute cut, duly described in the letterpress, and referring to some Old Testament "type." Those who are acquainted with the Mediæval mystery

plays, or with the survival of this ancient in still to be witnessed at Ober Ammergau, will remember prominence everywhere given to these Old Testament types. No one who habitually recited his rosary after the suggested by Nitzschewitz could fail in a short time to acquire a wide acquaintance with all the most striking episodes of the Old and New Testaments.

It would take a great deal too long to give details of the many pictorial rosary-books produced in the Netherlands between 1478 and 1535. I will only refer to one of the earliest, which appeared with the same series of fifty woodcuts, only in Latin and Flemish, but also in English, called "The Mystik Sweet Rosary of the Faithful," and was published at Antwerp in 1533 by Keyser, or, as his name appeared in a gallicised form, Martin Lempour. The woodcuts, though small, are of a high order of merit. But the most famous of rosary-books, one which appeared in a very large number of editions, which, as I gather from a recent catalogue of Quaritch, commands high prices, was probably that of the Don Alberto de Castello which was printed at Venice in 1521. The others I have mentioned, it supplies a picture for each of the fifty Hail Marys, but being later in date, it reconciles this with the earlier books do not, with the division of the whole rosary into the modern fifteen mysteries. I am at a loss to account for the value set upon the book, the engravings are not very remarkable, but it went through a number of editions, and when the blocks became too worn for further use, a completely new set were engraved on new lines.

There were many more such books, but we must hurry, and I have barely time to mention the large one destined to commemorate the rosary by Erhart Schöner, or other artists, or the picture painted by Albert Dürer representing our Lady of the Rosary with the Pope and Emperor St. Dominic, a picture destined originally for a confraternity of German merchants residing in Venice, but which is preserved at Prague. A word, however, must be said of the famous Rosary Tablet at Nuremberg, carved by Veit Stoss, which a plaster cast is to be found at the South Kensington Museum. With the kind permission of the director, I have taken for me an admirable photograph of this. I hope to show on the screen. Unfortunately neither the original at Nuremberg nor the South Kensington reproduction represent the complete work. The cross within a circle, fifty roses, which forms the centre, was originally surrounded by a series of small bas-reliefs corresponding to the fifty mysteries which the faithful were to meditate successively as they repeated the fifty Hail Marys. The cross begins with the creation of Adam and Eve, and it ends with the Last Judgment. Unfortunately six of the bas-reliefs have been removed, and are now at Berlin. Let me add here, however, even older and more widely spread subject of meditation, saying the five decades of Hail Marys belonging to the five Sacred Wounds. I say more widely spread because the pictorial representations of these in connection with the rosary are extremely common, whether in large sculptures and altar-pieces or small engravings. The most frequent type represents a garland of flowers divided into tens by five larger roses, upon which are embossed the right and left hand, the right and left foot, and finally the pierced heart of Christ representing the five wounds. German examples are plentiful, and for instance I may refer to a quarrel of stained glass at the Castle, which is supposed formerly to have belonged to the Abbey. Numerous little woodcuts, containing the five wounds, are met with in rosary books, and sometimes we find a rose in the centre, with a wounded heart upon it and the hands and feet in the corners.

I have been amused lately to find that a very fine block of this kind, which has somehow been used as a piece in one of the works of Francis Bacon, has been taken as a proof that the printing of his books was in the hands of the Rosicrucian brethren, familiar with his cipher. These ciphers, says Mrs. Pott, the foundress of the Bacon Society, the printers, banded together in a society, go on using to this day. It may interest some present hearers to learn that on the cover of the *Journal of the Society of Arts*, June 28, 1895, we may read (in a sumably) the following words, "Francis Bacon, Viscount of Albans, Lord Verulam, Shakespeare, instituted the Society of Arts in London for the good of English Commerce." At least Mrs. Pott informed the Bacon Society in a paper before that body and published in their journal shortly afterwards.

But to return from this digression, the garlands of roses which are a conspicuous feature of nearly all these pictorial tablets of the fifteenth century imply of course a rosary, the now generally accepted name of the devotion, the *rosenkranz*, as to which name I have as yet said nothing. To determine at what date it was introduced seems

\* The phrase "a pair of beads," meaning a rosary, is one of the few terms which, being lost to the language at large, have survived among English Catholics. It is used by Chaucer, and in old English wills it occurs again and again. Formerly a set of anything, whether the number were two or more, was commonly called a pair. We still retain the expression two pair of stairs, meaning two flights of stairs. The biographer of St. Hugh of Lincoln speaks of his receiving *duodecim paria literarum*, meaning twelve separate missives.

No clear example of it as a name seems to occur in the fifteenth century. The beads themselves bore many names, "paternoster" being the commonest, but they were called rosaries. Rosarium is no doubt rosarium (*sertum*), of roses, the corresponding words "chapelet," "corona," "ranz," "capellina," all convey the idea of garland. At which it was common to an extent which we have now difficulty in realising, for both men and women in ordinary wear garlands of flowers, and to place such garlands as of respect upon the heads of persons and statues. It is easy to illustrate this from Chaucer, and the metrical writers, whether English or French, but the strongest comes from quite prosaic sources.

*chappelliers* or makers of head-gear of Paris, as we find Boyleau,\* included not only workers in felt and wool but also *chappelliers de fleurs*, whose business it was to make garlands for actual wear. Amongst their statutes, we are drawn up as formally as those of any other trade, it being forbidden, under a heavy penalty, to wear garlands on Sundays, except that while the rose was in season they might occupy themselves on that day in making rose wreaths, though they were not free to make any other. So we find St. Louis, King of France at the same time passing an ordinance that rose garlands were not to be worn on Fridays. The idea of rose garlands was, therefore, familiar, and although I am aware that rosarium was not only used in the sense of what we should call an array or collection of choice extracts, I am strongly tempted to believe that its application to the particular devotion of the Virgin Mary was mainly due to the wide prevalence of the particular story of a garland which we can trace very much earlier than the word itself in almost every part of the world. The name, it seems to me, must have come from the story, and the story was not, as we should at first be tempted to think, evolved out of the name already pre-

legend in question, which occurs with slight variations in some of those quaint collections of "Miracles of our Lady" which were so popular in the Middle Ages, is briefly this:—A man was accustomed to make a wreath of roses or other flowers every day, and to place it upon the head of our Lady's image. He became a monk, and in the cloister his occupations were not permitted him to observe this pious practice. Being distressed, he asked counsel of an aged priest, who advised him to say fifty Aves every evening (in some versions 150, in others 25), which would be accepted by our Lady in lieu of the garland. This the young man faithfully did, until one day, being upon a journey, he had to pass through a lonely wood where robbers were lying in wait. They were employed in watching him, feeling sure of their prey, and, unsuspecting of their presence, remembered that his robes were not yet said, and forthwith stopped to say them. To their surprise, the robbers saw a most glorious lady appear before him, and take one after another from the lips of the monk fifty beautiful roses, which she wove into a garland and placed upon her head. The robbers, so the story tells, conscience stricken at the vision, were all converted to a better life, and themselves soon after entered the monastery.

This story meets us in every part of Europe at a very early date. Perhaps the earliest clear instance is in a collection of German popular poetry assigned to about the year 1236. At the end of the same century we find it told by King Alfonso the Wise, King of Castile, in his "Cantigas de Santa Maria." It occurs also in several thirteenth-century Latin versions of the miracles. Then in the fourteenth century we find it in Mielot's French prose narrations, and it was also dramatically included amongst the interesting French miracle plays of the fifteenth century. In the fifteenth century we meet it again, with slight variations of detail, told both in France and in Spain as the history of the true origin of the rosary, the most curious of all, we find that it has by that time spread into far off Abyssinia, almost as remote a spot, one might think, as it was then possible for any Christian legend to reach. Amongst the spoils brought back by Lord Napier's expedition from Magdala in 1867 were some extremely valuable Ethiopian manuscripts, now in the possession of Lady Meux. Some of these are illustrated with miniatures and coloured gorgeously, but with a somewhat barbaric taste. These codices supply abundant evidence regarding the art of Ethiopia in the early stages of its development. But the contents of the manuscripts are also interesting. They preserve collections of the miracles of our Lady, so well known in the East for many centuries before, and amongst these we meet the story of the rose garland, unchanged in substance, though told of a cleric of Rome named Zacharias, the leading authority of whose history are elaborately illustrated in the miniatures. Whether the use of the rosary itself was familiar in Abyssinia in the fifteenth century I am unable to say, but the

Meux manuscripts prove that it was regarded as a conspicuous adjunct of religious life there a century or two later.

Taking the term rosary, as is usually done, in its wider acceptance so as to include all forms of praying beads—need I say that the word "bead" itself originally meant a prayer?—it is remarkable what very great variety we observe in Mediaeval rosaries. The rosaries themselves have not been preserved to us. I know of no specimen certainly older than the year 1500, and at an exhibition at Limoges some few years back in which an attempt was made to bring together some ancient examples, nothing could be procured which was of earlier date than the sixteenth century. None the less we know them from pictures, and especially from the careful and elaborate representations on tombs, as well as from the details given in inventories and wills. Before 1450 sepulchral effigies with rosaries are distinctly scarce. There are many hundreds of drawings of early Mediaeval tombs in the Gaignières collection at the Bodleian, a collection of drawings made in France long before the havoc wrought by the Revolution. I have found amongst them only one fourteenth-century tomb with a rosary. But in the few extant early examples, whether in this country or abroad, there is the greatest possible variety. Two fourteenth-century examples of effigies—one at Bangor and the other at Worcester—show rosaries divided into sevens or sixes. A figure of a mourner at Warwick (c. 1430) exhibits a rosary in nines. Some early French and German examples are carefully and intentionally divided into fives or sevens, and elsewhere we count seventy-five beads or eighty beads, or forty or thirty-three often without divisions of any kind. One type of arrangement, consisting of six decades, with a pendant of three extra beads, appears in the fifteenth century, and became very common in the sixteenth and seventeenth, especially in France and at Rome. It was distinctively called the corona and was probably intended to honour the sixty-three years assigned by legend as the years of our Lady's mortal life. I attribute to this form the prevalence of the pendant of three small and one large bead seen in nearly all modern specimens. One of the earliest examples I know of a pair of beads exactly agreeing with the modern type is the Duke of Norfolk's magnificent golden rosary which belonged to Mary Queen of Scots, and which at the present moment is being exhibited at the New Gallery. In the Bangor effigy, which shows eighty-four small beads divided into sevens by larger beads, three large brooches and what seem to be two rings are also attached to the rosary. One is reminded of Chaucer's Prioress:—

Of smal coral aboute hir arme she bar,  
A peire of bedes, gauded all with grene,  
And theron heng a broche of gold ful shene,  
On which ther was first write a crowned A,  
And after: *Amor vincit omnia*.

It is dangerous to begin to quote inventories, the series would be endless. But I note that in the inventory of plate and jewels of Charles V., King of France, in 1380, there are entered nineteen rosaries (patenostres). These, as regards material, were made of rose-tinted amber, jet, coral with pearls for markers (seignaulx), gold beads, rings of gold, blue and white enamel, jet beads with eleven gold croizettes, black amber and pearls, coral alternating with beads of silver-gilt, and two instances of gold beads of Damascus work which were filled with musk. Various objects are also mentioned as suspended from the beads themselves, e.g. cameos, brooches, a stud (bouton) or pendant of pearls, five frezettes (ruffs?), a little lozenge set with pearls, and on the same rosary a croizette of coral and a crucifix of gold. As regards the number of the beads, which is not always mentioned, there are one or two instances in which the normal type, as we should now consider it, of 50 smaller beads, with 5 larger beads or 5 seignaulx, is specified; but in other cases we find rosaries of 200 gold beads, one of 50 beads with 11 seignaulx, one of 62 beads in all, one of 75 beads and other smaller ones of twelve or less. So, again, in the inventory of the Princes of Orléans-Valois in 1408 we have one rosary of amethysts and jasper, with a bouton or stud of pearls, another of jet, with nine little bells (dandins) of gold, and a jewel with nine pearls as a pendant, and another again of jet, with nine gold seignaulx and a gold figure of St. Christopher attached.

There can, of course, be no doubt that such rosaries were quite as much used for personal adornment as for purposes of devotion, with the result that these objects of piety were not overlooked in the sumptuary laws which strove to check the unbecoming extravagance of the burgher class, especially in Germany. The Police Ordinances of Nuremberg, for instance, in the thirteenth and fourteenth century, forbid the using of "patenosters" of above a certain value, and give curious and minute instructions as to the manner in which they should be worn. Similarly the Municipal Council of Regensburg, in 1485, amongst other attempted restrictions on habits of luxury, decreed that no one should possess more than three

\* Boyleau, *Livre des Métiers*, p. 198.

or four rosaries, and that these should not be of the value of more than 10 gulden. As three fat oxen could then be purchased for 12 gulden, this seems a pretty generous allowance.

One would like to know a little more about the workmanship expended upon these articles of luxury, but the objects themselves have disappeared, and the guild statutes collected by Boyleau tell us very little on this head. The beads do not seem to have been wired, but simply perforated and strung upon a cord. This, no doubt, accounts in large measure for their complete disappearance. The jewels have simply been released from their cord, and used for necklaces, bracelets and other purposes. An incident in Rabelais lets us know that it was an easy thing for a malicious person to cut the string of a lady's rosary and to pocket the beads which came tumbling down. The only objects belonging to these Mediaeval rosaries which have been at all extensively preserved, and which we can now recognise as having served for this purpose, are the marvellous spherical boxwood carvings, which at the end of the fifteenth and the beginning of the sixteenth century were used as pendants to hang from the more sumptuous kind of bead chaplet. These pendants or nuts vary in diameter from one to three or four inches, and the carvings also, though such scenes as the Crucifixion or the Nativity often recur, show much diversity, and are by no means always connected with the "mysteries" of the rosary. Several fine specimens belonged to the Spitzer collection, and M. Arthur Pabst, in a detailed notice of this section, speaks as follows:—"A special place in the history of sculpture ought to be reserved for these tiny objects, which are called in French *grains de chapellet*, and which are known in Germany as 'prayer nuts' and 'pater-nosters.' They belong to that section of devotional art which was so earnestly cultivated by artists at the close of the Middle Ages. These rosary beads, carved in boxwood and spherical in shape, are often enclosed in an open work-case, or sometimes with two such cases, one outside the other. The bead opens with a hinge and displays two hemispheres, in the hollow of which are carved two scenes, generally composed of a large number of figures."

Often we find a flat movable disc separating the two halves, itself covered on both sides with delicate carving. Executed as they are with extraordinary skill, these groups, which are often cut in high relief and completely detached from the background, are no doubt *tours de force*, and are not free from a certain exaggeration; but for all that there is much in the attitude and pose of the figures which betrays the hand of the true artist. These carvings are probably of Flemish origin, but they may have been wrought under the influence of masters of North Germany in the fifteenth century. It is quite likely that they all come from a very small number of workshops, and the fashion certainly did not last for more than 100 years. To judge by the architectural details in the carvings and from other indications, all that are now in existence were probably produced in Flanders between 1475 and 1530. Flemish portraits (there is one, for instance, in the museum at Brussels) of this period sometimes show a decade of beads, at the end of which may be recognised one of these large spherical boxwood nuts. The most magnificent specimen now in existence is probably that in the possession of the Duke of Devonshire, which is said to have belonged to Cardinal Wolsey, and to have been given by him to Henry VIII. In the terminal bead, 4 inches in diameter, twenty-four different scenes are elaborately carved. Three or four fine specimens are in the Waddesdon collection lately presented to the British Museum, and by the kindness of Mr. Read I have been able to obtain photographs of two, which will be shown on the screen.

There are many other aspects of the subject which invite further discussion, but my paper is already too long, and I will take my leave here.

### BIRMINGHAM WATERWORKS.

A REPORT has been prepared for the water committee by Mr. Mansergh, the engineer, which shows that, whereas the Parliamentary estimate for the first instalment of the Elan water was 3,755,350*l.*, the present estimate is 5,884,918*l.*, showing an excess of 2,129,568*l.*, but of this amount 750,000*l.* is stated to represent the cost of works not included in the original estimates for the first instalment.

Mr. Mansergh first separates from the cost of the works that of land, easements, &c. He says:—"The 1891 estimate for the land of the watershed, the easements for aqueduct and local works, and the land for Frankley reservoirs and filters and the whole of the railways, was 485,257*l.*, made up as follows:—Watershed, 300,000*l.*; easements, aqueduct, 97,680*l.*; Frankley reservoirs, &c., 18,000*l.*; local works, 5,000*l.*; add 15 per cent. contingencies, 63,102*l.*; railways, net, 1,475*l.*; total, 485,257*l.* The present estimate of the final total cost under these headings is 542,768*l.*, which is something under 12 per cent.

more than the Parliamentary estimate. This figure only has been arrived at by the town clerk and secretary, carefully considered the details of each uncompleted item in the light of the experience of previous purchases, and each item to the best of their ability; but they wish to be understood that the figure is given with all reserve, and may be exceeded when the ultimate cost is known."

Mr. Mansergh next submits a tabular statement of original and ultimate estimates of the cost of the works for the first instalment. From this we extract the following figures, including the addition of 7½ per cent. for contingencies, and the 15 per cent. provided for contingencies, and part of the cost of the Dol-y-mynach dam transferred to the second instalment of works:—

Description of Work.	Total Original Estimate. £	Ultimate Estimate. £	Excess £
Railways, &c.	48,375	53,378	5,003
Reservoirs and all works other than railways on watershed.	761,550	1,517,975	756,425
Aqueduct—Careg-ddu to Frankley.	1,825,350	2,336,316	510,966
Frankley reservoir and filters.	273,292	440,612	167,320
Mains to Monument Lane and city boundary, cost of reservoirs at Northfield and Warley, and mains from city boundary to service reservoirs.	228,259	372,140	143,881
Totals for works	3,136,826	4,720,421	1,583,595

The first item in the table consists of the railways authorised by the Act of 1892 and the extensions of the main line to the valley required to get the plant and materials to the works. "The line from the junction with the Cambrian to Caban was the earliest of all contracts let, and was completed below the estimate. The extensions have been longer, heavier and more difficult than was anticipated, and parts of them were done after the general rise in the prices of materials and labour had made itself felt; but I need not say more, as with this item we may all be very well satisfied. With regard to item No. 2 Mr. Mansergh says the estimate of 99·3 per cent. "calls of course for some extra, which it is not difficult to give."

### Foundations of the Dams and Haulage of Stone.

1. At all the dams we have had to go either deep into the bottom of the valley or deeper and longer than at first could reasonably be anticipated. It was the unanimous opinion of the very experienced engineers and geologists who gave me the opportunity of examining with me all the sites before they were deposited, that I had provided sufficiently for the foundations. It has turned out differently. At the Caban, for instance, we came upon broken and open-bedded rock on the bottom of the valley in the up-stream half of the dam site, which took deeper than was expected, and on the Radnor side with an extraordinary fissure, which had to be excavated to a depth very much greater. Wherever this extra was needed the "hole" had of course to be filled with watertight masonry or concrete at five or six times the cost of the digging.

2. Another great disappointment was the fact that we did not find any stone good enough to build with near the bottom of any of the dams but the Caban. From the first I thought that we should have to obtain all the stone for the foundations of the dams from near the Caban, as it was only at that spot that the silurian grit beds and conglomerates were visible, and so did all the geologists and engineers. Higher up the valley we should find, after removing the weathered slate, sound blocks of that material good enough for "heating." From a small quarry near Dol-y-mynach I obtained in 1891 samples of sound slate which I tested and found to be a weight carrier almost equal to granite. The lack of this material has rendered it necessary to take every ounce of building stone, both for foundations, concrete material, and sand (crushed out of the stone) from the lowest point in the valley right up to all the dams, increasing very greatly the cost of haulage.

3. It has also involved us in the expense of importing stone from Pontypridd and other places facing stone which we have to procure from our own quarries on account of our reliance on them for getting the rough heating material for the dams.

### Workmen's Wages.

4. Another very important cause of increased cost that applies to this and every other part of the works is the prevalence all over the country, viz. that the wages of all

ve been constantly increasing without a corresponding increase in output.

operating in every branch of work, so that it has not only our own labour costs in the valley, but has the price of all manufactured goods, such as iron-works, cement, &c., and of costly plant like cranes, and air-compressing machines, which we have had to

possible to say how much of the extra cost of these due to this cause, but it is undoubtedly a very big only in what has been done by administration, but t which has been let to contractors.

#### *Extras on the Aqueduct.*

To. 3 Aqueduct.—The "original" estimate for the was 1,825,350*l.*, and the "ultimate" is 2,336,316*l.*, excess of 28 per cent. As I have already informed tee, it soon became manifest, when we got out the drawings of the bridges, that these had been originally nated. Then an obligation was put upon us in to build one important bridge (important because syphon, and had to be made wide enough to carry pipes) in stone and brick instead of steel, which increased the cost. We were also compelled to river Severn with one span of 150 feet, and the Canal with one of not less than 100 feet, and in the e cases the bridge was in such a position that it bent on us to put up a structure that would not be but worthy of the great undertaking of which it of the few exposed features. We have not met with erious difficulties on the aqueduct considering its varied character, but we had to go deep with some foundations at the Ithon Bridge, to line all the oughout and to make a complete alteration in the e crossing of the Severn Valley Railway and on the of the Severn Valley, on account of a very serious had necessitated the shifting of the railway from its sition and which was only discovered when we began pipe trench. These extras on the bridges and the al works added to the excess cost of labour before fully account for the 28 per cent. increase over the estimate.

#### *Works at Frankley and Mains to the City.*

ard to these items, Mr. Mansergh says:—I must in fairness to myself to make some explanation, ould have preferred to do so without referring to colleague, Mr. Gray, but this is impossible. The : this part of the works (which it was originally r. Gray should design and carry out) was made by : most perfect good faith and to the best of his : I never had a free hand in the matter after certain : "estimate figures had been submitted to the : the report by the committee, dated October 13, : is certain from the outset that Mr. Gray's estimate : too low, and I was ultimately allowed by the then : of the committee to add 75,000*l.* to the reservoir : at this was only about half the addition which I then : make. Another material point to be taken into : Mr. Gray's under-estimation of the water require- : the high level districts, which cannot be supplied by : from Frankley. Mr. Gray was not a prophet, : doubt he did his best to forecast the future; but : matter came to be fully investigated in 1896 the : on the high levels was found to be so great and : rapidly that the whole arrangement for supplying : had to be altered, the pumping plant for the North- : Warley districts to be enlarged, and additional : power will also have to be installed at Monument

going under-estimations account for some part of s but there are other reasons which I will shortly t. A railway has been made from Rubery station l to enable us to utilise for concrete the stone of a e to the railway; to facilitate the getting up of all ks, dressed stone, sand and other materials and o shorten the time of construction; and to give a s of access in the future when extensions of the are required. 2nd. Originally the quantity of p to be obtained from the Elan was 67½ million y, and the first instalment was put down at two millions, and all the pipe connections about the reservoir and filters and the distributing mains (to h later) were originally intended to deal with that subsequent observation of the rainfall between 1891 ed me to expect that we could rely upon 72 to 75 day, and on mature consideration it was decided r Frankley drawings were being got out to put in all connections and fittings for half of the 75 millions, as avoid much trouble and effect a material saving of ture. The filters are also set out to do more than

was originally intended. The extra outlay now incurred may therefore be looked upon as an anticipation of works beyond the first instalment and accounts for another part of the excess, the rest being due to the enhanced cost of labour, as already explained.

Item No. 5. Local works, consisting principally of the trunk distributing mains from Frankley into and through the city. "Original" estimate 228,259*l.*; "ultimate" estimate 372,140*l.*—As in the case of the Frankley reservoir, filters and high-level works, I am not responsible for the major part of the original estimate. Mr. Gray's intimate acquaintance with the whole system of distribution entitled him at that time to a dominant opinion on the subject, and I had no occasion to go into the matter until the report on distribution was prepared in 1896, excepting to a very limited extent when reporting jointly with Mr. Davey on the "existing works" in February 1895. The distributing mains as now being laid are designed to deal with half the water, as I have already described in respect to Frankley. I am sure this is the best thing to do, as it will postpone for a long time the necessity of breaking up the roads, reduce the number of pipes in the ground, and ultimately result in a saving of expense and a minimum of inconvenience in the city. When all the cost thus involved is set against the "original" estimate it shows a large excess, but much of this should really be regarded as a prudent and justifiable anticipation of outlay on subsequent instalments. Contracts (15 and 17) for "local works," and in fact most of the others, have necessarily had to be let whilst the prices of iron were abnormally high, and all the labour charges, represented in the prices tendered by the contractors, have been affected for the reasons hereinbefore stated. The special works needed to deal with the many obstructions in the shape of gas and water pipes, sewers, &c., underground, are of course troublesome and necessarily costly, and the contractors have had to provide for the contingencies connected with them by covering prices.

#### NEW LAW COURTS IN SYDNEY.

THE Minister for Works of New South Wales intends, in consequence of representations submitted to him through the Department of Justice, regarding the necessity for the erection of new law court buildings in Sydney, to submit the matter to the Cabinet for consideration during the present year. It appears that the State Minister for Works has received through the Department of Justice a letter addressed by the Chief Justice and the judges of the Supreme Court to the Attorney-General on the subject, pointing out that successive Governments have for many years past recognised the need for taking steps in the direction indicated, but despite the fact that much information has been collected and plans put in hand, nothing definite has yet been done. Attention is directed to the dilapidated state and unsuitability of the existing buildings in the city, which have been serving as law courts for so long, and to the opportunity there is now offering of placing upon what is termed "a really magnificent site" (the area extending from the Mint to near St. Mary's Cathedral) a pile of buildings worthy of the State. This project should also offer a splendid opportunity for one of those competitions in connection with the design of public buildings, respecting which the Institute of Architects of N.S.W. recently visited the Department of Public Works.

#### TESSERÆ.

##### Constable's Cloud Studies.

JOHN CONSTABLE, R.A., spent entire summers in painting skies from nature. In a letter to a friend, dated October 1821, he says:—"I have done a good deal of skying, for I am determined to conquer all difficulties, and that among the rest. That landscape-painter who does not make his sky a very material part of his composition neglects to avail himself of one of his greatest aids. I have often been advised to consider my sky as 'a white sheet thrown behind the objects.' Certainly if the sky is obtrusive, as mine are, it is bad; but if it is evaded, as mine are not, it is worse; it must, and always shall with me, make an effectual part of the composition. It will be difficult to name a class of landscape in which the sky is not the keynote, the standard of scale and the chief organ of sentiment. You may conceive, then, what a white sheet would do for me, impressed as I am with these notions, and they cannot be erroneous. The sky is the source of light in nature, and governs everything; even our common observations on the weather of every day are altogether suggested by it. The difficulty of skies in painting is very great, both as to composition and execution, because, with all their brilliancy, they ought not to come forward, or, indeed, be hardly thought of, any more than extreme distances are; but this does not apply to phenomena or accidental effects of sky, because they always

attract particularly. I may say all this to you, though you do not want to be told that I know very well what I am about, and that my skies have not been neglected, though they have often failed in execution, no doubt from an over-anxiety about them, which will alone destroy that easy appearance which nature always has in all her movements." The studies Constable made of skies were in oil, on large sheets of stiff paper, and on the back of every one are memoranda of the date, the time of day, the direction of the wind and other remarks, for instance, "September 6, 1822, looking S.E.; 12 to 1 o'clock; fresh and bright between showers; much the look of rain all the morning, but very fine and grand all the afternoon and evening."

#### The "Zodiacs" of Denderah.

The portico in front of the temple of Denderah is formed of twenty-four columns arranged in four rows with quadrangular capitals, having a colossal head of Isis, or, as some say, of Athor, on each side, surmounted by another quadrangular member, each face of which contains a temple doorway with two winged globes above and other decorations. The shafts of the columns are perfectly cylindrical and of equal diameter all through, and the whole height, including the base, the quadrangular capital and dé above that is 46.10 English feet. The front is adorned with a beautiful cornice and a frieze covered with figures and hieroglyphics, over the centre of which the winged globe is predominant. The ceiling of the portico is occupied by a number of mythological figures, among which the French savants thought they recognised the signs of the zodiac; but Dr. Richardson observes that the number is incomplete, as the Crab is wanting, and he with other recent travellers and archæologists is of opinion that it is no zodiac but a collection of mythological emblems without any reference to astronomy. On the east side of the temple there are some apartments both on the ground floor and upper storey. On the ceiling of one of the latter under the roof of the temple there was another assemblage of mythological figures resembling those on the ceiling of the portico, though fewer in number and differently arranged. This was called a planisphere or zodiac, because in the middle of it figures similar to the signs usually adopted to represent the twelve constellations were observed. The ceiling is encompassed with three broad circular lines, and it is only the central space that is occupied with this mythological table, which appears as if supported by twelve figures, four females, one above each angle of the room and the other eight distributed in pairs between, and having hawks' heads. In the middle of this assemblage of emblems are certain figures which have been taken for the signs of the zodiac, ranged in a sort of circular order, but without any regularity of distance. The lion, the bull and the vase-carrier are exactly above three of the female figures that extend from three of the corners of the room to support the tablet with their heads; Scorpio, for the sake of regularity, should have been above the head of the fourth female figure, but it is not, neither is Libra. Capricornus, Sagittarius, Scorpio and Libra are all crowded without any regularity into one division, and instead of the Crab we have a broad-backed spider. Richardson observes that he compared the figures of the temple of Denderah with the engravings in the French work on Egypt, and found the latter a very incorrect representation. His opinion with respect to this pretended zodiac is the same as that concerning the one in the portico, namely, that it is not meant for a zodiac, but is a congregation of gods and goddesses and religious processions.

#### The Purpose of Sculpture.

Sculpture may be simply defined as the art of conveying ideas by means of form; its object is generally considered to be imitation; but properly speaking, its aim or purpose may be defined as suggestive rather than imitative. So far from imitation being its ulterior aim or purpose, it is only one of the means it uses to work out its intentions. Sculpture attempts in no way to deceive the eye; it, in fact, rejects many things which, were that its object, would tend much to accomplish it. Colour, for instance, that would render it a much nearer approach to nature than it is has, by the general consent of ages, been excluded from it. It is true that in the best days of the art colour was used, and there are even now persons who venture to advocate the re-adoption of it; still, it is but fair, finding it as we do thrown aside for so long a time, to infer that its rejection has arisen from a general feeling of the inutility or impropriety of it; from a more mature consideration of the real capabilities and purposes of sculpture, and consequent understanding that colour does not in any degree contribute towards them. No one, in looking at the celebrated antique statues, is for a moment deceived into the idea that he is really gazing at a living being; he neither expects it to move nor speak; on the contrary, his mind is directed to a higher train of thought. The "Apollo Belvedere" is like nothing that we have ever seen or met with in nature; it is only so far like that it in no way offends us as a physical impossibility. Such extracts or selections from the human form are taken in it only

as serve to give a perfect semblance to youthful god as help to embody the subdued self-dependent energy whom all things are alike easy; who has only to accomplish. The sculptor has omitted in it all that to the one expression he has wished to convey the absence of a too servile or literal imitation of nature the form, lifts it into the supernatural, keeps the respectful distance and separates him from it as far from God. Take, for example, again the magnificent "Niobe." Does the eye delight in any curious approximation to life? does the beholder's senses deceived, and seek to know how this is accomplished? Every part is true to nature, but it is only so true that the thoughts free from any impression to the contrary it is in all its parts, for without beauty it would attract us towards it nor gain for itself our permanent consideration; but the lesson which the artist intended to convey in it is of a high and instructive object for which he has wrought has been to create a deep sympathising sorrow for the awful trial which that strongest of all human feelings, maternal affection, have succeeded in this—and who will deny it?—humanity, at, and attained, one of the highest purposes of sculpture that commands for the art the public respect, and it to be classed among the instructors of mankind.

#### Backgrounds in Paintings.

The importance of some secondary points of scenery, background, drapery, ornament, is frequently that, independent of the want of more essentially possessed in a very eminent degree, they have singly insignificance to esteem names that had few other considerations; and neglected, in spite of superior position in the choice or conception of a subject, in style, and perhaps of colour of expression, and composition, often have left little but apathy to the eye of works produced by men of superior grasp and excellence. Fewer would admire Poussin were it not for his scenery, though Mengs has asserted that in his subject is more frequently the appendix than the background. What right could the greater painter del Sarto's historic compositions claim to our deprived of the parallelism, the repose and space figures are arranged; or the ample draperies that and hide with solemn simplicity their vulgarity and limbs? It often requires no inconsiderable mental power and technic discrimination to the sublimity of Michel Angelo and the pathos of Fra the total neglect or the incongruities of scenery ground which frequently involve or clog their composition add by fancy the place on which their figures occupy the horizon that ought to elevate or surround the masses of light and shade indolently neglected or higher principles. How deeply the importance of situation, with their proper degree of finish, were before and after his emancipation from the shackles Bellini, every work of his during the course of his tenary practice proves. To select two from all, that of the *Dominican Peter*, that summary of his powers, and the *Presentation of the Virgin*, on historic essays owe, if not all, their greatest effect. Loftiness and solitude of site assist the sublimely descending vision to consecrate the actors beyond characters and style of limbs could claim, and render an object of submissive admiration, whilst its simplicity renders the second one of cheerful and indulgent; and reconciles us to a detail of portrait-painting propriety of associating domestic and vulgar in a consecrated subject. It is for these reasons that the of scenery and background has been so much praised Reynolds, who frequently declared that whatever assistance he might admit in the draperies or other figures, he always made it a point to keep the art of the scenery, the disposition and ultimate finish of the ground to himself.

#### Colour in Stained Glass.

The assertion that colour is the primary object of glass will, we are aware, appear a truism; yet it has been always fully felt, as witness the miserable designs of West, at Windsor, and the utter failure of a window at Oxford, after Sir Joshua Reynolds. However, the bare assertion that we wish to make, should draw consideration to the kind of colour most suitable and to give reasons for the peculiarities of that suitable with common sense, and, at the same time, the purposes of the art. No one will venture to propose a system of colour adopted in stained glass a natural too splendid to be so termed; besides, in nature, secondary instead of primary; but why should it be natural? Because, in the first place, stained glass

architecture, which is in itself not an imitative art; in the next place, it treats of things apart from common life; the staining of church windows is not intended alone for the building, but to separate the thoughts of the people from all association with the affairs of this life; to direct them from everything outside the building or to that devotion for which they are assembled. For the supernatural beings, saints and allegorical personages introduced; parables of Scripture, visions of a future life represented; subjects are chosen which tend to lead the mind from that which is and to connect it with that which is to be. Even in halls where aristocratic pride and splendour are fostered by the art, natural forms are replaced by the monsters of heraldry substituted in their stead; apparent then to reason that such things as these should be coloured with the everyday tint of common life, this would but weaken their effect—but rather enhance their earthly splendour more properly belonging to them than to supernatural beings. Stained glass fell into decay in this country with the decline of the Roman Catholic Church, and the pictures handed down to us are all of an early age when the drawing and knowledge of chiaroscuro were in their infancy; the consequence is that though powerful in their effect, they are otherwise deficient as works of art, and when they are used now, when the art is reviving, to justify this premature quaintness, as if in its ancient days it had reached perfection and nothing was left to us but to imitate the copies of what has gone before. Attempts have been made to depreciate modern glass under pretence that the pictures are neither so brilliant nor so durable as in the days of the system now practised of shading on the surface of the glass by colours burnt into the body of the glass is illegitimate and leads to decay. All these arguments are, however, in our view, unavailing. As well might we go back to the pre-Raphaelite school of painting as imitate the defects in the old glass, or to the ignorance of the times. No art must be judged on the contrary, all means within reach must be employed to reach excellence, and that excellence must be sought by sound reasoning, not by following quaint antique precedents. The prevailing weakness in modern stained glass is not in the colour, where most people fancy. As far as regards the properties of colours, we have succeeded almost to perfection; but in drawing and in light and shade we are beginners. Like all symbolical art, stained glass is of the purest style of outline, and, owing to mechanical processes of its own, only a very powerful chiaroscuro will give it its proper effect.

#### Florentine Duomo and the Versailles Palace.

The Republic of the Florentine Republic, which in the thirteenth century ordered the construction of Santa Maria del Fiore, could not be surpassed by any edict of ancient Rome. Whereas the chief aim of a people of great origin is to be great in a way that, from its outward works, every one can recognise both its wise and magnanimous manner of government, we order Arnolfo, chief architect of our city, to design and to execute the complete rebuilding of Santa Maria del Fiore with the greatest possible magnificence that the Republic is capable of conceiving, since it has been decreed that both public and private, by the most able men of the Republic, nothing should be undertaken for the community that does not correspond entirely to the ideas of its most noble citizens united together to decide on such subjects. Contrast this with the pride and fear of Louis XIV.—who, in view of the sepulchre of his race—which led to the construction of the Palace of Versailles, and we have the difference of the difference between the nobility of a people, whose imaginations are exalted by art, and the ambition of a ruler who makes art the mere instrument of his glory. The relative magnanimity of the two is strongly shown in the disregard of expense on each side. The king forced a powerful and wealthy people to the brink of ruin to gratify his selfishness, for the Palace of Versailles has been said to have cost from twelve to forty millions of francs. The Republic of Florence contributed their money to the construction of edifices with a proud alacrity which would astonish modern economists. In 1334 they commenced building the Campanile, passing a decree that it should be the most magnificent, height and excellence of which it could achieve in that kind had been achieved by the Romans in the time of their utmost power and splendour. The first stone was laid accordingly with great pomp on July 18 following, and the work prosecuted with such costliness and utter disregard of expense that the citizens of Verona, looking on, exclaimed that the Republic was taxing her strength too far, that the united efforts of two great monarchs would be insufficient to complete the Campanile, which the signoria resented by confining the architect for months in prison, and afterwards conducting him to the public treasury, to teach him that the Florentines build their whole city of marble, and not one poor steeple

only, were they so inclined. This "one poor steeple" is the most beautiful specimen of tower architecture the world has to show, costing at the rate of about sixty pounds per superficial foot, making an entire expenditure of five millions old currency, which, by taking the present value of wheat and comparing it with the price of the fourteenth century, would augment its cost fivefold.

#### Obelisks and Spires.

An obelisk is a lofty monumental four-sided shaft diminishing upwards with the sides gently inclined, but not so as to terminate in an apex at the top; neither is it merely truncated or cut off at the summit, but the sides are sloped off so as to form a flattish pyramidal figure, by which the whole is suitably finished off and brought to a point, without the upper part being so contracted as to appear insignificant. Herein, as well as in their purpose and application, besides other circumstances, obelisks differ from spires, which are carried up from their base to a point, and which nevertheless are beautiful on that very account. It may be asked why the same form that pleases the eye in the one case would be disagreeable in the other. To answer this question we must consider not only wherein they agree, but wherein they differ. Whether perfectly square or not, obelisks are uniformly quadrilateral, whereas spires are polygonal, and consequently the bases of their sides are much narrower in proportion to their entire diameter, so that the diminution is not so sudden as it would be in a four-sided mass of the same bulk and height. Secondly, a spire is generally terminated by a pinnacle, cross, or some other ornament at its summit, whereby sufficient importance is given to it; and thirdly, a spire neither is nor is intended to look like a solid mass of stone, but requires to have a certain expression of lightness, both in itself and so as to bring it into harmony with the rest of the building. An obelisk, on the contrary, either is or is intended to appear not only a solid mass but a single stone, standing upon a massive pedestal, and that pedestal resting on the ground. Hence it is obvious that so far from being attended with any beauty, the reducing it to a mere point would greatly impair its character, and in a measure destroy all nobleness of appearance towards its summit, because it would be of inconsiderable bulk for a considerable length downwards. Though the mere form of the obelisk has no particular beauty to recommend it, as is proved by the meanness and pettiness of little obelisks employed merely as decorations in *catafalchi*, and also in many buildings of the time of James I., yet when wrought out of "time-defying material," and of colossal dimensions, it produces a most imposing effect. As a monument an obelisk is greatly preferable to a column, inasmuch as it possesses all that recommends the latter without being open to the objection of being a mere imitation of what was designed for a totally different purpose, and never intended to be insulated or considered as complete in itself. The greater diameter of the capital and abacus, which is both a beauty and propriety in a column supporting a superincumbent mass, ceases to be so, or rather becomes quite the contrary, when the column supports nothing. The abacus, forming in fact a square platform on its summit, overhanging the structure itself at its angles, gives the whole a top-heavy appearance, which is still further increased by a railing upon it.

#### Classic Dies.

The orders are sometimes set on pedestals consisting of a square shaft, called the die, with a moulded base set on a deep plinth. The die is surmounted with mouldings forming a capital, but in reality resembling more the cornice of an entablature. Chambers allows, for the proportion of the die of the Tuscan pedestal, 2 modules 24 minutes; for the Doric, 3 modules 6 minutes; the Ionic, 3 modules 18 minutes; and the Corinthian and Composite, 4 modules. The bases and capitals are respectively—Tuscan, base 28 minutes, capital 14 minutes; Doric, base 32, and capital 16 minutes; Ionic, base 36, and capital 18 minutes; and Corinthian, base 40, and capital 20 minutes.

[The Editor does not hold himself responsible for opinions expressed by the writers.]

#### Berkeley and Smibert.

SIR,—The short article in your last number on John Smibert is interesting on account of the (1) subject, for that artist's name is almost forgotten in this country; (2) for the link which he formed between English and American art; and (3) on account of his connection with Berkeley's project. The last, to my mind, is the most important. Berkeley had resolved to

civilise the planters and other Englishmen who lived in Bermuda, and who on account of the remoteness of the island were approaching the condition of the natives around them. Berkeley intended to accomplish his end by setting up a college in which the arts and sciences as well as the principles of religion and morals should be taught. It was the first occasion in which the fine arts were recognised as a civilising agency, and much credit is due to Berkeley for so noble a proposal, and to Smibert for co-operating with him. It is evident that the educational utility of art is not yet fully recognised, for not so many years have elapsed since the Slade professorships were founded, and it cannot yet be said that the fine arts are recognised officially as having a place in the curriculum of an English university. It is not to be wondered at that nearly two centuries ago many statesmen were opposed to Berkeley's experiment.

It is, however, an error to say "the king's death dispelled the vision." George I. died of apoplexy in Osnaburg in 1727, but it was not until a year afterwards that Berkeley sailed from the Thames. He had resolved to spend all his resources on the enterprise, and he had been promised, in addition to several subscriptions, a sum of 20,000*l* from the Government for the endowment of the college in Bermuda. Instead of going to the island directly, he landed first at Newport, Rhode Island. We may assume that John Smibert was with him. After a short time Berkeley went to reside in the interior of the island, where he built a house which he called Whitehall, while his friends went on to Boston, where Smibert gained success as an artist. Berkeley came to the conclusion that the contemplated college would be more successful if placed in Rhode Island instead of in Bermuda, but he found that he was so hampered it was impossible to set about the work in either place. Sir Robert Walpole, who was in power, repeated the promise that the 20,000*l* should undoubtedly be paid, but he advised Berkeley to abandon the project and return to Europe. Conduct so contradictory was not unknown at the time, and was looked upon as statecraft. Berkeley was therefore compelled, after three years' waiting, to return to London, and the downfall of his project should be ascribed to Sir Robert Walpole.

Educationists must always regret that the Bermuda experiment was never carried out. Berkeley was a man of undoubted genius, and it was well said of him that he possessed every virtue under heaven. But although in philosophy he could be considered as an idealist, his "Querist" is enough to show that in dealing with affairs he was remarkable for shrewdness and common sense. A college in which the arts would hold a place, and which would be started in a new country, free from the antiquated prejudices of the European universities, might have accomplished an intellectual revolution.—Yours obediently,

J. C. D.

### GENERAL.

**Mr. Thomas Gordon**, architect, died on Friday last at Eastbourne.

**The Alexandra Palace**, which has been conducted as a municipal place of entertainment for eight months, up to the end of last quarter shows a loss on revenue of 2,006*l*., and this deficit Mr. Henry Burt, to whom the public are indebted for the acquisition of the place, has offered to make good.

**M. Dalou** has completed the models of the memorial of Gambetta which is to be erected in Bordeaux. M. Formige is associated with him as architect.

**Sir John Aird & Sons** have been entrusted with the works of the new ocean dock at Avonmouth, Bristol. The total cost of the dock is estimated at close upon 2,000,000*l*.. The amount of the tender of Sir John Aird's firm will not be published until the contract is signed.

**The Artists** who will form the committee of direction for the exhibition of French art which will shortly be held in London will consist of MM. Paul Tiliier, president; Albert Maignan, vice-president; François Flameng, Gosselin, Guignard, A. Léonard, Marqueste, Mongin, T. Robert-Flcury, Weerts; L. Prétet, commissary; F. Philippon, secretary.

**Mr. Justice Buckley** has caused a series of transverse wires to be fitted beneath the roof of his Chancery Court, with a view to improving its acoustic properties.

**M. Denys Puech**, the sculptor, has completed the medallions of Victor Hugo, Corneille, Racine and Molière, which are to be placed under the peristyle of the Théâtre-Français.

**The Tender** of Messrs. Pethick Brothers, of Plymouth, has been accepted for the contract for widening London Bridge for the sum of 95,484*l*., which would be paid for out of the funds of the Bridge House Estates. It was stated that Devonshire granite would be used. The work will probably be commenced in April. The Act of Parliament allows five years for its completion.

**A Protest** has been signed by several German in Rome declaring that the bust of Goethe, which a gift by the German Emperor, is not a fitting representation of German art, inasmuch as it was rejected by the exhibition in Strasburg.

**Professor T. McKenny Hughes, F.R.S.**, has been elected to the Cambridge Antiquarian Society the investigations of the unearthing of another Roman villa along the river terraces north of Cambridge. He said, a good many human remains, and they were graves of irregular occurrence over the area. There have been those of well-built people of large stature, mesocephalic skulls. The pottery and the remains of animals were found chiefly in pits, such as were so common and around every Roman settlement; as, for example, at Chesterton, but also to some extent scattered over the site. The scarcity of Samian pottery might indicate that the inhabitants, or the late date of the settlement, was distinctly Roman element. It was probably a village of Romanised Britons.

**The Court of Common Council** have declined to grant towards the scheme for the preservation of the Palace of Richmond Hill.

**The Prussian Minister of Public Works** has announced prizes of 5,000, 3,000 and 2,000 marks for the best design for measuring wind pressure. The competition will close on April 1, 1903. A further prize of 1,000 marks will be paid for the instrument which has the best design of a long trial.

**The Subject** for the design in the Rougemont competition of the Ecole des Beaux-Arts was this year a free design for a collection of the designs by the late Charles Garnier.

**Mr. Arthur Evans** has resumed the series of excavations near Candia which have yielded such remarkable results during the past two years. The completion of this important work, which has thrown a lustre on British research, is endangered owing to want of funds. Mr. Hogarth's proposed excavations at Mycenae, already stated, Mr. Hogarth's proposed excavations at Mycenae, abandoned. The promising sites reserved by the British Museum for British exploration will, no doubt, be claimed by French or German archaeologists. Liberal support from their respective Governments, whom will fall the credit of the great discoveries, is every reason to anticipate, will be made in the future.

**Mr. B. M. Ward** will read a paper on "Victorian Windows" before the Liverpool Architectural Association Monday next.

**Mr. A. W. Rich**, a member of the New English Club, will hold in the beginning of March an exhibition of colour drawings at the Egyptian Hall, Piccadilly. The drawings are chiefly of English landscape, and especially subjects in Sussex, Suffolk, Surrey, Gloucestershire and other southern counties. The exhibition opens on Monday and will continue for twelve days.

**A Private View** of pictures and studies of the Lake of Galilee, by Mr. John R. I., will be open to-morrow at 148 New Bond Street.

**Mr. B. H. Thwaite, C.E.**, will read a paper on "The American Patent Law Practice and Engineering" at a meeting of the Society of Engineers to be held at the United Service Institution, Whitehall, on Monday. It will be an opportunity for those interested to discuss the various and important amendments to the new Bill now before the House.

**The Examinations** in Science and Art fixed for the week ending June 28 by the Board of Education will be held during the week ending July 5.

**Mr. Arthur Pye-Smith**, managing director of the known St. Pancras Ironwork Company, Ltd., has been appointed a Justice of the Peace in the county of London.

**The Following Architects** have entered their names as candidates for the associateships of the Royal Academy, to which there will be an election on June 1. T. Duncan Rhind, 10A George Street, Edinburgh; J. Macintyre Henry, 7 South Charlotte Street, Glasgow; R. S. Lorimer, 1 Bruntsfield Crescent, Edinburgh; A. Hunter Crawford, Rutland Square, Edinburgh; James B. Dunn, Frederick Street, Edinburgh; T. 14 Saxe-Coburg Place, Edinburgh; John Keppel Street, Glasgow; John A. Campbell, 44 West George Street, Glasgow; Alexander N. Paterson, 136 Wellington Street, Glasgow. There are also forty-eight painters and sculptors.

**A Book** will soon be published containing a history of about national, municipal and endowed theatres in England. William Archer and E. O. Sachs. It will enable the architect to see what is the experience in continental cities.

# The Architect.

## THE WEEK.

history of the Eastbourne Technical Institute is s. When the sanction of the Town Council was to the scheme it was believed that the work would cost more than 20,000 $\text{\pounds}$ . Plans were prepared by Mr. ROBSON, and then various suggestions were offered. Tenders were introduced at the desire of the committee. Tenders were sought for carrying out the amended and it was decided to recommend the acceptance of G. MINTER'S, the amount being 34,730 $\text{\pounds}$ . or 2,000 $\text{\pounds}$ . some reductions were made. It was also proposed at a fire station, but the committee advised that no for that work should be accepted. The discussion subject took place on Monday last, and it was then there was a stronger opposition than had been anticipated. One Alderman suggested that a different architect be appointed, a local man who was acquainted with requirements of Eastbourne. Another speaker said the work would cost 40,000 $\text{\pounds}$ , and advocated the conversion of the town hall into a technical institute, and the erection of a new town hall. A third councillor contended that the fire-station was the more important building. It was decided to refer the subject back to the committee, or, in other words, to shelve it for an indefinite time. It seems to us that what the Council desire is the erection of a technical institute by the Duke of DEVON. His Grace has given one of the most valuable sites for the building, and it may be thought that his generosity could be extended. It is also evident that the site offered for a town hall, in which local authorities would be at more advantage than in the existing building.

The statue of *Liberty Enlightening the World*, which stands at the entrance to New York Harbour, was the first which brought M. EIFFEL into notice. When several Americans in France resolved to present it with a statue that would be symbolic, M. BARTHOLDI, the sculptor, was invited to prepare the model. After many deliberations it was determined that the figure should consist of a large number of plates of copper, which were to be riveted together so as to form an exterior covering for a structure consisting of lattice girders. The designing of the interior structure was left to M. EIFFEL, and his connection with the Eiffel Tower and his subsequent prosperity. But for some unknown reason the statue was no great welcome for poor Liberty when she crossed the Atlantic. She was treated as if she were a circus elephant, and was made a *casus belli* between various nations. At present, we believe, the War Department is in charge of the gift. Mariners do not care for lights of any kind, and the flaming torch of Liberty is said to be a hindrance. Orders have therefore been given for the statue to be extinguished. The copper wants cleaning, and the air may have injured some of the plates. It will be complimentary to Frenchmen if their offering, which is the biggest statue in the world, should become a ruin.

The Manchester Corporation are setting a good example by erecting several types of cottages at Blackley. They anticipated that benevolent people will be inspired by them to see such convenient houses to imitate the Corporation. As suggesting the desire which now exists in Manchester for the improvement of the humblest class of dwellings, a resolution was passed at a meeting in Manchester on Saturday last recommending that (a) the by-laws of the Corporation be so altered as to render impossible the erection of unbroken rows of dwelling-houses with their opening direct upon the common pavement and with their back-yards; (b) the encouragement in every possible way of the erection of artistic cottages and the development of suburbs with gardens and playgrounds for the recreation of the children. As much reliance is placed on whatever is done by the Manchester authorities, the Corporation statement relating to the experiment of the cottages will be regarded with interest. Working-class people may be willing to pay a higher rent for increased convenience, but the slums are not likely to be closed until

better houses are obtainable at the rents now charged. The effect of a timely gift on housing schemes has been exemplified in Port Glasgow. Two plans were proposed. The larger would cost 22,196 $\text{\pounds}$  for the purchase of the property, and impose a rate of 5 $\frac{1}{4}$  $d$ . The reduced scheme would cost 12,418 $\text{\pounds}$ , and the rate would be 3 $d$ . in the  $\text{\pounds}$ . Mr. W. T. LITHGOW, a shipbuilder, has, however, offered 10,000 $\text{\pounds}$ . if the larger scheme is adopted, and also to relieve the Council of the risks which follow dealing in land by taking over the cleared ground at a valuation. The offer has been accepted, and the inhabitants will not be required to pay more than a 3 $d$ . rate.

THE judgment of Mr. Justice JOYCE in *BAKER v. MOSS* is one which has been long desired. Everybody who is connected with building is aware that in the suburbs of London it is quite common to take away gravel and sand from fields, and then to allow rubbish to be shot into the new receptacle. After a time grass grows over the surface, and the spot becomes "eligible building land." Between 1886 and 1890 a piece of ground near Shepherd's Bush was treated in that way, but so much material was removed, and the stuff carted to it was so varied, that the hollow was never fully filled up. It became a dangerous pond, and the sanitary authority had to interfere. The water was at length removed and grass was grown instead. When it had attained the desired appearance it was advertised for sale by auction as a freehold building site in the midst of a capital letting class of property, and therefore was ripe for immediate development. A builder paid 1,500 $\text{\pounds}$ . for the ground. Then he discovered that in order to bring it up to the standard of the London County Council as a building site it would be necessary to undertake expensive operations, as the gravel and sand had been excavated to a depth varying from 7 to 20 feet. He therefore, instead, brought an action for rescission of contract on the ground of misrepresentation. The defendant contended that the property was correctly described, and if the soil were excavated and proper foundations laid the outlay would not be more than was required for building basement houses on ordinary land. Mr. Justice JOYCE, in giving his decision, said the ground was practically useless for the purpose for which it had been purchased. The plaintiff had relied on the description, which stated that the ground was a capital freehold building site, ripe for immediate development, and was, in consequence, induced to buy the property. His Lordship added that he was not sure that in a case of this sort the burden was not upon the vendor to show that the purchaser was not induced to enter into the contract by the misrepresentation. Judgment was accordingly given for the plaintiff.

GERMAN architects on Friday last were able to celebrate the centenary of the birth of ERNST FRIEDRICH ZWIRNER, who was perhaps best known as the Dombau-meister, or architect, having charge of the cathedral of Cologne. He was a native of Jacobswalde, in Silesia, and a pupil of SCHINKEL. In 1833 he obtained the inspectorship of the works connected with the restoration, or rather completion, of the Cologne Cathedral, which WORDSWORTH, the poet, considered was a task fit for angels. He succeeded so well that in 1842 the restoration of the choir was finished and the King of PRUSSIA in 1848 was able to lay the first stone of the central tower. SCHINKEL, it should be remarked, was in apprehension several years before that any addition of the kind was impracticable, and, in fact, the project had been abandoned. Originally it was contemplated to use masonry alone, but afterwards ZWIRNER advocated the employment of iron and the structure was raised. Several archaeologists were opposed to the introduction of metal in so famous a building, and, indeed, it was suggested that ZWIRNER was incompetent, as he was unfaithful to the traditions of Gothic construction. However, he held on, and as there was the majority of the union or society for restoring the building in favour of his propositions, he was able to remain in office until his death in September 1861. He erected several other buildings in Cologne, including the museum, the synagogue, the church of S. Apollinaris at Ramagen and the castle of Herdringen. His success was not without influence, and the number of buildings which exemplified the Gothic Revival may be considered as effects of ZWIRNER'S restoration of the cathedral.

## JOHN FRANCIS BENTLEY.

*(See Illustration.)*

THE loss of an able artist is always to be deplored, for even when old he may possess creative power that is sufficient to endow the world with something that will be always a public treasure. In the case of JOHN FRANCIS BENTLEY there are circumstances which make his sudden withdrawal from this world peculiarly saddening.

He was long known to his friends and acquaintances as a man who was endowed with undoubted ability. During the Gothic Revival it was anticipated that he was destined to leave a name in connection with the style. Not only in his buildings, but in his metalwork and designs for various minor classes of production, he demonstrated that he was not only a master of detail but had caught the Mediæval spirit. Some people from his manner then supposed he was over-confident; but he realised the extent of his powers, and was assured he was capable of more important commissions than he had received.

JOHN BENTLEY, however, was too proud or too sensitive to seek after any aids to success with the exception of the cultivation of his own talents. He laboured no doubt under the disadvantage of being a Roman Catholic, and he was too independent to attempt to persuade people that his religion was a gain to him as a Gothicism rather than an impediment. While, therefore, his dignity suggested that he should wait until commissions were brought to him, he saw important buildings entrusted to contemporaries who could not claim the possession of greater artistic skill. When he received commissions for churches or monasteries for his co-religionists he was generally hampered by the want of funds. Considering the conditions under which they were erected, his Seminary at Hammersmith, at least in its former state; his church of the Holy Rood at Watford; St. Mary's, Cadogan Street; and Corpus Christi, Brighton, are all skilful adaptations of means to ends under financial difficulties. At length the great prize for which JOHN BENTLEY had been hoping for several years came to him under circumstances which must have appeared as remarkable.

To the ordinary observer who takes a general interest in churches, there is no need at present of a Roman Catholic Cathedral in London. The substitute which is found at Kensington seems to be equal to all requirements of an exalted ritual, and it is sufficiently accessible to worshippers and spectators. But the rulers of the Church believed in the necessity of another building, and some years ago a site was secured on a spot where a prison stood behind the tall houses in Westminster. The proposal excited no enthusiasm among the laity, and the ground lay unused for several years. The history of church architecture shows that great ecclesiastics are willing to carry on a project of church building, and the desolate ground was accepted as a legacy from his predecessor by His Eminence Cardinal VAUGHAN. With admirable courage he resolved to make an attempt to erect a vast and costly building. He was well advised in selecting JOHN BENTLEY as the architect.

The style proposed was an incentive to an architect's enthusiasm. The Roman Church is without an official style in architecture, just as it is without authorised translations of the Scriptures, and it has often found advantage in the deficiency. For a time Gothic was approved as suitable for England, then it was suddenly superseded by Italian Classic or Renaissance, either of which modes was thought to be more in keeping with Ultramontane ideas. But no one had anticipated that inspiration would be drawn for an English cathedral from the New Rome, as it was once called, that is, Byzantium or Constantinople. The style had, however, the advantage of novelty for people in the West, and it was considered to be capable of affording a vast area which, if too extensive to allow of a preacher's voice being heard everywhere, was at least favourable for services in which music was to be an auxiliary.

For a man who was somewhat of a dreamer like JOHN BENTLEY there could be no style which was better adapted to call forth all his energies. His constructive power could be exercised in numerous domes and arches. While the style has a largeness about it, it is made up of an infinity of small parts, and for a man who had had experience with Gothic, and especially with Gothic detail, there was a field in which he could revel. When we find that the ordinary

bricks were from their dimensions considered to be too large for a Byzantine building, and it was necessary to have made at Bracknell corresponding in size with those in Sta Sophia, we can realise the delight which was afforded to the architect by so grand and novel an experience. JOHN BENTLEY also was a master in decoration, and knew that all his ideas would take several generations to carry out, but he was able to gratify himself with the conviction that whatever he contemplated would be respected, and however gorgeous the cathedral might become it would in all its parts be a manifestation of his skill. JOHN BENTLEY therefore set about the work with energy, and we suppose the time he spent in studying Byzantine examples and in preparing designs was the happiest in his life. He had also the satisfaction of seeing that the project in its new form was well supported. When it is remembered how general is the position of the Roman Catholics, it is remarkable that so much labour was forthcoming to enable so costly a building to be erected.

In his enthusiasm, however, JOHN BENTLEY had not measured his physical strength. He had scarcely completed his plans when he was warned by paralysis that he must be cautious in overtaxing his powers. He failed him, but so long as his creative power remained he was able to endure the affliction with equanimity. His pencil spoke for him. He was one of those architects who find pleasure in making drawings, and if it were possible he would have dispensed with vicarious assistance. There was no delay in the constructive arrangements through the diminution of his strength, and he directed the whole execution of so vast a work as if he retained all his vigour. The fact that an announcement could be made to open the building was a testimony to the industry which the works were superintended and the fidelity with which so many people laboured to realise his ideas. The tests of the acoustic properties of the cathedral were most satisfactory, and everything promised a joyous summation which to such a man would be the best for all his anxieties. The Westminster Cathedral, however, to afford one more illustration of MILTON'S principles which are applicable to so many artistic projects—

But the fair guerdon when we hope to find,  
And think to burst out into sudden blaze,  
Comes the blind Fury with the abhorred shears,  
And slits the thin-spun life.

In the peculiar circumstances of the case there was that is tragic. JOHN BENTLEY had, of course, rivals, but he had no enemies. Every architect who knew him was only by repute, was aware that throughout his career he upheld the highest standard of the profession, and never be alleged that to gain an end he had performed an unworthy act. He bore disappointments with fortitude, and if fortune often ignored him he accepted it philosophically. When the opportunity came to him of what was in him he set about his task courageously without the least ostentation. If he had lived long enough to see the cathedral would be a credit to him and would have demonstrated to visitors from all parts of England possesses able architects who were waiting for occasions to show that they are the successors of the unknown men who raised churches and cathedrals which no changes in taste can leave without honour.

As JOHN BENTLEY had only reached his sixtieth year, several years of happy endeavour might be expected as before him. But in our time there is no reckoning the duration of a life in which the brain and its powers are to be much exercised. A week ago he could look forward with confidence to the opening of a building which would be not only a revelation of his genius, but a proof of his existence. But even if he were able to foresee the summary disappointment which awaited him, we believe he would have accepted his fate in a manner befitting a Christian. That he may rest in peace will be the wish of all who knew him, and who must regret the loss of the ablest architects of our time.

The funeral took place on Wednesday. CARDINAL VAUGHAN delivered a brief address in St. Mary's, Clapham, and stated that there were two principles in the life of the departed—art and duty. The cathedral at Westminster would be a monument.

# THE AMAZON IN ART.

WHEN Professor KISS sent his *Amazon attacked by a Tiger* to the Hyde Park Exhibition of 1851, the not only revealed that Prussia possessed a sculptor was able to produce a work which many considered to be the noblest among those of all nations, but it exemplified an important fact that the most ancient subjects were not neglected, and could acquire a new interest at the hands of a modern genius. In the group there was in the first place a suggestion of the difference in character between man and animals, as well as the superiority of reason over brute force. The tiger appeared to express an insatiable desire by its grip of the horse. The horse, although so much larger in bulk, was helpless and writhed in agony under the teeth and claws of its energetic enemy. The Amazon, on the contrary, showed not only courage that was equal to the situation, but intellect in the employment of her strength. She had moved backward on the horse in order to bring more power to the blow, and the moment chosen for the attack was one of suspense, for every spectator felt that unless the Amazon's thrust was at once fatal to the tiger there would be no victor. An enlargement of the statue, with a more harmonious union, is now to be seen outside the Public Gallery in Berlin, and those who can recall the exhibited work consider the copy to be no less impressive. Classic themes, when treated in the spirit of the ancients and with the knowledge of modern art and love for fine lines possessed by Professor KISS, never become old.

The legend of the Amazon might have been invented by a sculptor in order to display a variety of forms such as nature had not provided for models. As in the case of Aphrodite, the Amazon was a harmonious combination of the characteristics of men and women. The legend in which girls competed under conditions similar to those laid down for manly youths would be enough to suggest a being in which vigour and grace were united. It has been asserted that one of the few subjects treated by Greek art which the Spartans condescended to admire was the Amazonian, and it is even believed that the contest, of which we give an illustration, is derived from a sarcophagus found somewhere in Lacedæmonia. It was not surprising, however, for the sculptors to create the form, for the tradition of the existence of Amazons was a very old one in Greece, and especially in Athens.

The covered legs of the women in the relief indicates that the Greek sculptor supposed the combatants were of Asiatic—i.e. of Asiatic—origin. It was related that the Amazons had fought against HERCULES and BACCHUS. Hippolyta in command they were said to have defended Attica, and to have fought with THESEUS. This Amazon has been immortalised in a manner which no Greek could rival. For in a "Midsummer Night's Dream" the festivities for the marriage of the two leaders followed the combat. We also know that OBERON, King of the fairies, suffered the tortures of jealousy when he discovered that his wife, the Queen of the Fairies, was in love with THESEUS.

Shall I not lead him through the glimmering night  
From Perigenia, whom he ravished?  
And make him with fair Egle break his faith,  
With Ariadne and Antiopa?

TITANIA was able to chide her lord about his bouncing Amazon, his buskined mistress and warrior-love, the fair Hippolyta. The serious consequences of their wrangling have been chronicled by the poet. The topsy-turvydom by which genius was able to unite Greek mythology and Northern fairyland with the carpenters, joiners, weavers, bellows-menders, tinkers and tailors of an English village was never so finely displayed as in a "Midsummer Night's Dream," in which the whole world, ancient and modern, was made kin.

The Athenians, however, believed in the legend. There were parts of the city which owed their names to the contest with the Eastern women. At the time when they were most intellectual the people had one of the walls of the Pœcile painted by MICON, the son of PHANOCUS, with the Battle of the Amazons. PAUSANIAS admired it. MICON was selected because he had acquired a reputation for representing horses, and he was judged to be unrivalled in contests between mounted and unmounted warriors, or between Centaurs and the Lapithæ. The painting was evidently on a long wall. We know, too, that the Amazons appeared to be unconquerable, owing to the number of figures who after being struck down seemed ready to revive the combat. The picture was made a subject for the wit of ARISTOPHANES. Probably MICON was only following many precedents, and in turn his painting served to suggest similar scenes to other artists. Battles of Amazons were often used for the decoration of Greek vases. They were also much in favour for the adornment of sarcophagi. There is a famous example in the Capitoline Museum, Rome, which was derived from a burial vault in 1744. On it the contest is suggested by various incidents, such as the rescue of Amazons, and the fierceness with which the battle-axes were wielded by them. On the lid seven Amazons are to be seen who were taken captive, and some of whom it was necessary to fetter, for while their hands were free they would not be subjected.

In the relief which we illustrate and which was brought from Greece to Vienna by a son of CHARLES V., it will be observed that much skill is shown in the composition. There are three groups of combatants. While there is symmetry there is also variety. On one side the Athenian sustains with some difficulty the attack of the Amazon, whilst on the other side the man is the victor, for the Amazon has lost her battle-axe. In the central group the Athenian is endeavouring to rescue a wounded companion and is unable to employ his sword; he has accordingly to ward off the attacks with his shield. Another contrast is afforded by the wounded warrior and the dead Amazons near him. The Athenians are armed with sword, helmet and shield, while the Amazons use shield and battle-axe. The woman who fights on foot evidently wore a coat or cloak with sleeves, of which the old Hussar jacket seemed to be a survival. Although they might be thought to be their enemies, the sculptors are never unjust towards the Amazons. As combatants they are shown to be equal to the Athenians. The hairdressing or corumbus corresponded with that adopted by the Greek virgins, for in Greek and Roman statuary the coiffure

follows definite arrangements, and was not left to the artist's fancy. To indicate their youthfulness, the breast of an Amazon is never fully developed, and is only partially revealed. In fact, there was much correspondence between the forms of the Amazons and of the goddesses. The cincture or belt they wear is also kept low, while in some draped figures it is close to the breast. The duality of the contest represented on the sarcophagus is suggestive of compositions which were used to fill metopes, and there may have been more or less affinity between the figures and those seen on the Parthenon and other temples. A comparison of the illustration with an engraving of RUBENS'S *Battle of the Amazons* will suggest how wide is the difference between sculptural and pictorial treatment, as well as the reserve shown by the Greeks in avoiding all maiming and degrading of the women.

It was, no doubt, considered to be proper to indicate by the costume of the Amazons that they were of a Scythian or other Eastern race. In the more complete clothing of the women there was conformity with ancient traditions. But the sculptors believed after a time it was possible to dispense with the greater part of the drapery. The single figure which we give, if compared with the relief, is evidence of a revolution in artistic thought. It will be observed that the legs are free from the *brace*, or breeks, which were supposed to be worn by Eastern races, and which in representations were employed to distinguish Greeks and Romans from other people. The arms are also bare. It might easily be imagined that the figure depicts one of DIANA'S nymphs who accompanied the goddess in hunting expeditions, but the peculiar light shield or pelta, and the helmet at foot, prove the girl was a warrior. We must also notice the strap for the spur across the instep of the left foot. The Amazons, like ancient masculine riders, did not need stirrups, and consequently the spur was placed on the foot which was not thrown over the horse's back in mounting, and thus injury was avoided.

It is sometimes difficult to say with precision in what kind of action an ancient figure is represented. For example, a statue of MERCURY appears to show with equal probability that he is engaged in taking off or putting on his winged sandal. In this case the Amazon was evidently occupied with her bow, but whether it was before or after use has caused discussion. Opinion, however, favours the conclusion that the warrior girl had ceased from combating; but as the hands have suffered from restoration it is possible that originally they were more suggestive of action.

The statue was formerly in the collection of the Villa Mattei, and was transported by CLEMENT XIV. to the Vatican. On the plinth is inscribed the words, "Translatæ de Schola Medicorum." It may be assumed that the statue was brought to the schola of the physicians from Greece.

According to PAUSANIAS and PLINY, the Temple of at Ephesus possessed at one time a large number of figures of Amazons. They were offerings which commemorated the shelter which was given to the luckless warriors in their battle with BACCHUS. One result was that emulatio was excited by a commission for an addition to the collection. At one time it was considered that the beautiful of the statues was one by POLYCLETUS. An Amazon by PHIDIAS was esteemed as holding a high place, and third was assigned to a figure by CTESIAS. Some critics hold that the "Mourning Amazon" in Rome, is likely to be a copy of the work by the sculptor.

It is remarkable in connection between ancient and modern times has been preserved by means of figures which must have appeared to be the products of imaginative legends. Gorgons, hydras, centaurs and the like have been always interesting, but little is known about the lives of the men, women and children of ancient Greece. The Amazons have been almost familiar, but we say much about the equal powers of Greek warriors. This has not been entirely disadvantageous. Wonder and admiration are admirable agents in keeping traditions. MAX MÜLLER asks why do the puerile and repulsive legends of the tribes rivet our attention and engage our thoughts? The reason he gives is that we want to know what man is worth, to know what man has done. Consequently it has been found that in a great number of myths there is conformity with our own thoughts, and it may happen that the repetition in various ways is fast becoming the characteristic of our time, and entirely unknown to the Greeks when they devised the stories of Amazons. The problem of the Weibliche in an age of

It is hardly worth considering the Amazon more than myths. In African wars female warriors are not unknown, but a difference between the element or a bodyguard and a nation of Amazons. Yet within the period of credible history was so to be written it was recorded that Amazon ALEXANDER THE GREAT. ARRIAN investigated the subject, and although

considered there was something incredible about the story, he was confident there was a race of Amazons. The writers of their region was supposed to be on the banks of the Caspian Sea. PLUTARCH relates that they fought with POMPEY.

In later times the traveller ALVAREZ, who visited America in 1520, speaks of a race of Amazons south of Darien. They were warlike, and fought with bows and arrows, and on bullocks. They were governed only by a queen. PETIT has written a long book to prove that the Amazons, in which all or most that is reported about them will be found collected.

## SCHOOL ARCHITECTURE.\*

Official reports in this country are rarely amusing.

One of the exceptions will be found in those of the Education Department. The inspectors of schools give acts occasionally from the literary exercises of the pupils. They suggest efforts to deal with subjects of which writers are ignorant. It would be well if the school in which the children studied was sometimes selected as a model to be treated. It is always useful to have the views of occupants of buildings, and the children's opinions at lead to improvements in planning. At present in all countries pupils are treated as if they were raw material to be subjected to a variety of processes. Their convenience is rarely considered.

In England the oldest schools were the so-called grammar schools. As in many places there was a connection between them and almshouses or other charities, there was no desire, unless in exceptional cases, to erect costly buildings. The income was often barely sufficient to pay instruction, and the schools were consequently allowed to fall into a poverty-stricken condition. But no matter how humble might be the buildings, there was no doubt sent out students who afterwards served the State in various ways. The success so often attained created a faith that the teacher was everything and the school itself of little importance. That, however, was a very ancient position, for the history of universities abounds in instances of great scholars holding forth in improvised lectures and of students coming long distances and braving many perils in order to receive the instruction.

About sixty years ago a couple of Chartists named J. J. and COLLINS, who were at the time imprisoned for their opinions in Warwick Gaol, were the first to propose the establishment of schools resembling the Board schools which now exist. They recommended the erection of day halls, at a cost of only 3,000*l.* each, in various parts of the kingdom. The halls were to be used during the day for infant, preparatory and day schools, in which the children should be educated on the most approved system, receiving physical, mental, moral and political instruction; and in the evening for public lectures on physical, moral and political science, for readings, discussions, musical entertainments, dancing and such other healthful and rational recreations as might serve to instruct and cheer the industrious classes after their hours of toil. The halls were to have two commodious playgrounds, and where possible a pleasure-garden attached to each; apartments for the teachers, rooms for hot and cold baths, for a little gymnasium, a laboratory and general workshop, where the children were to be taught experiments in science, as well as the first principles of the most useful trades. The small plan of building reveals the apprehension in which the scheme was put forth. The halls or schools were to be supplemented by circulating libraries, each to cost a few pounds. It was only a dream of two political economists, but it shows the difficulty at the beginning of the late QUEEN'S reign of setting up schools unless they were attached to churches or chapels. Thousands of Board schools day and evening instruction is available to an extent beyond the vision of Chartists.

When the Education Act came into operation there were a great many buildings in England which could be taken as models for imitation. This fact should be remembered in criticising the shortcomings of the early Board schools. Endowed schools consisted of large rooms, and the private schools were often small rooms in private houses. The two Chartists we have referred to do not imagine a public school in any other form than a school. According to the conservative instincts of Britons, the boards still keep up the tradition, although a considerable change is made to modern requirements by introducing movable partitions. We may say that one of the differences between English and other schools which strikes the eye when he first looks at the plans in Mr. WHEELWRIGHT'S book on "School Architecture" is that in English and foreign schools there is a more general sub-

division of area than is adopted in this country. The contrast is perhaps most remarkable, on account of the name, in the English High School, Cambridge, Mass. It possesses "forty-eight schoolrooms, twenty being on the first and second floors respectively, and eight on the third floor; twelve receive their light from the courts, the remaining thirty-six occupy the street fronts. The typical schoolroom of this building is intended for thirty-five pupils, but will accommodate forty or more, according to the mode of seating and the size of the pupils." In addition there are assembly halls, library-rooms and lecture-halls, drawing-rooms, &c.

Although much is said about English schools in Mr. WHEELWRIGHT'S volume, it is not likely that many of their peculiarities will be imitated in America. For instance, in the United States separate enclosures, or "wardrobes," for the children's clothing are provided for each classroom, but in England they are very rare. The Americans believe that large, general cloakrooms are not orderly, and there is loss of time in the use of one in common. Sanitary reasons are also against them. Instead of 140 cubic feet of air for each child, as in London, in the American primary schools there are 164 feet, and in the grammar schools over 200 cubic feet. Warmed playrooms form part of American schools, but are not adopted in England. It is, however, remarked by the author that "the plans of English schools, except in the location of the hall on the first floor, and in the arrangement of wardrobes, are tending to be similar to the types which have been developed in the United States."

The procedure for the designing of English schools has become so unlike ordinary practice, owing to the desire of the Boards to have their own way, it is rarely an unofficial architect can expect a commission. It is consequently not worth the trouble to consider what improvements have been attained in America or elsewhere. Yet the subject is interesting. In the United States evidently the influence of the old English type of one-storey school is not without effect, for Mr. WHEELWRIGHT has to point out that "the disadvantage of long flights of stairs for children to climb is one of imagination." It would be well to have that belief confirmed by children. In New York the exertion is of less account, for the use of elevators has extended to schools. The roofs of the buildings are also sometimes arranged as playgrounds, and a climb is rewarded. But with all the desire for education and the well-being of children, schools are sometimes used which would not be tolerated for a reformatory in England. The following is an instance:—

In one large Ohio city, where the authorities pride themselves upon the low cost of the schools, there is a building four storeys in height, with stud interior partitions, furred walls and no fire stops. No metal or brick ducts are provided for ventilation; the foul air is supposed to find its way through the hollow spaces in floors and walls to the space between the roof and the ceilings of the upper rooms, and from thence through ventilators to the outer air. A more imperfect system of ventilation and a more ingenious fire-trap could not well be devised. The rough surface of sawed lumber and the backs of plastered surfaces gave ready lodgment for dust, and the uncertainty of the direction of the air under such conditions gave no warrant that this dust was not breathed in by the occupants of the building.

Although labour and materials may be costly in America, the difference in outlay between a school which from its appearance will have a disagreeable effect on the minds of children and one of an opposite class is not excessive. Generally the increased cost may be taken at 5 per cent. In the most elaborate school designed by Mr. WHEELWRIGHT, the Brighton High School, Boston, which would not be out of place in Old Chelsea or Chiswick, the architectural features—and there are pilasters, arches, a deep cornice, &c.—increased the utilitarian expense by only 8 per cent.

The elementary schools of the United States are generally of two grades, viz. the primary, having sometimes a Kindergarten, and (2) grammar schools similar to our Board schools or the German Gemeindeschule. The primary classrooms are usually 24 feet by 32 feet, and the grammar classrooms 28 feet by 32 feet. Each is designed to accommodate fifty-six pupils. Latterly provision has been

*School Architecture.* A general treatise for the use of architects and engineers. By Edmund March Wheelwright, architect. With many illustrations. Boston: Rogers & Mansion.

made for manual training, cooking and sewing. One of the school inspectors recommends that all grammar schools should have rooms for those purposes. A great many examples of American schools are given. Externally there is less regard for the picturesque than in England, although Mr. SNYDER's New York school would not be out of place in any English town. Fire is an evil which has to be guarded against, and especially in New York, and that may be one of the causes of the plain exteriors. Skeleton construction is adopted in some schools for the sake of economy, and it does not lend itself to style:—

All New York schools are now of fireproof construction. The building law requires a thickness of bearing walls proportionate to window surface, so that it proves to be more economical to use steel skeleton frame than masonry construction in schools when of four storeys or more in height. Walls 16 inches thick are permissible when the steel construction is used, but 36 inches of thickness is required when the construction is of masonry only. The thinner wall is not only less expensive, but is an element to be considered in the securing of floor surface and in the lighting of the classrooms.

Sometimes the basement is utilised as a playground, but in New York there is a prejudice against the arrangement, and the first or ground floor is employed instead. The normal height of classrooms in New York is 14 feet 3½ inches. The classrooms are usually 32 feet in length, 24 feet wide and 12 feet or 13 feet in height for primary schools. Although the atmosphere is, as a rule, very clear in the United States, as may be judged by photographs, an American classroom that is 28 feet wide and 13 feet high is not adequately lighted if the windows are only on one side. The following comparison between American and European schools is drawn by Mr. WHEELWRIGHT:—

Relatively to other countries, in liberal areas and in the decorative treatment of playgrounds the American schools are deficient. In the United States, on the other hand, greater floor and cubical area for each pupil is given in the elementary classrooms than is found in those of any other country. Excepting, possibly, in the Swiss and in some of the later schools of Great Britain, an ampler supply of warmed fresh air and larger ducts for ventilation are provided in American schools than elsewhere. In the best of the American schools there is better provision for the disposal of outdoor clothing than is generally found, except in some Swiss examples and in the later schools of the principal cities in Scandinavian countries. There are better plumbing appliances in the American schools than are probably to be found in any country. The American schools have the further advantage of the most generous provision of individual desks for the pupils; they have blackboard surface for the use of the pupils—a very uncommon feature elsewhere. In one respect the schools of the United States suffer most noticeably in comparison with those of European countries where popular education has been developed: sufficient light is not provided for the classrooms, except in those on the corners of the building, and in these the light is not usually disposed in the best manner. This defect arises from the adoption in the grammar grades of the class of fifty-six pupils seated at single desks. It originates in what the writer believes to be mistaken economy in school administration. In Switzerland public education is not absolutely free, but the tuition charge is small; but in what may be called the grammar grades, a class seldom has more than forty pupils, and the width of classrooms is rarely in excess of 24 feet, while in the United States classes of fifty-six pupils and rooms 28 feet in width are usually required by school committees.

Secondary schools are comparatively modern. One at Boston, designed by Mr. G. A. CLOUGH in 1877, may be considered as the first of the class. In the Groton School, designed by Messrs. PEABODY & STEARNS, the central part, consisting of a hall measuring 80 feet 4 inches by 42 feet 4 inches, with two porches, is a single storey. It is not, however, a public school. The manual training schools would appear to be more in keeping with American tendencies; but, as in England, there are not many which have been especially erected. One late example is the Mechanic Arts High School in Boston, completed in 1900, of which Mr. WHEELWRIGHT is the architect. Judging by the illustrations this is an excellent type, and it is largely stocked with machines and tools. Woodworking, pattern-making, turning and smithwork are provided for. The photographs of the classes suggest that more attention is given during lessons and demonstrations than is common in English schools. But in England students know that

their chances of success are impeded by trades-union rules which no ability is able to overcome.

Mr. WHEELWRIGHT has had a wide experience designing schools, but he adds to it by deriving information from the works of other architects. He shows progress which has been made in France, Germany, Austria, Switzerland, Denmark, Sweden, Norway, as well as in England. The book is therefore a very valuable contribution to professional literature. The information was no doubt originally collected for the author's use, but it can be taken advantage of by others, and it will aid helping architects to deal with an important class of structures for which the demand must increase. If the modern epic does not relate to "Arms and the Man," but to "Tools and the Man," there must be places provided where the use of tools is taught at an early age. The Americans somehow know more than the English about the aid which tools can give, and hence they are gaining supremacy. They believe that "if you do not use tools, they use you," and in their schools, as in their workshops, they endeavour to attain the desired mastery which afterwards brings so much power.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS

A MEETING of the Institute of Architects was held on Monday evening last, Mr. W. Emerson, president, in the chair.

### The Royal Gold Medal.

The PRESIDENT said he had to announce the sad occurrence which had taken place in the history of the Institute. The Council some weeks ago nominated Mr. J. Bentley as the gold medallist of the year. On Saturday Mr. Bentley was seized with a paralytic stroke, and died the next day. Had it not been for that, he had not the slightest doubt that that day Mr. Bentley would have been elected gold medallist of this year. Under the circumstances, of course, the Council were placed in a peculiar position. The gold medal was the grant of the King, and they could not exactly say what the King's views would be in reference to awarding the medal to a gentleman who had passed away only the day before the election. Therefore the Council decided to let the matter stand over for a while, and to refer to His Majesty to know what his pleasure might be. Should His Majesty be willing to allow the medal to go to the family of Mr. Bentley in honour of the great work which he had done, his name would come up for election at the next meeting. Mr. Bentley at the time of his death was engaged on the Brooklyn Roman Catholic Cathedral, New York, a building in the Gothic style. He was also engaged on a new Roman Catholic Cathedral at Westminster, which was one of the members present had had an opportunity of visiting. He also built or was largely responsible for the decoration of the church of St. Mary's, Cadogan Street, Chelsea, and the church of the Holy Rood, Watford; St. Mark's, 1 Audley Street; the Roman Catholic Seminary at Hammersmith; the church of St. Francis, Notting Dale; and the church of Corpus Christi, Brighton. He restored churches in the City of London, notably the church of St. Botolph, Bishopsgate. They all knew his work perfectly well, and there was no architect of greater refinement or one who would be felt and deplored by all members of the architectural profession. He thought that although Mr. Bentley was a member of the Institute, yet as one of their great professed would be quite fitting for the Institute to send a letter of condolence to his family, and of acknowledgment of his great work as an architect. He moved a resolution to that effect, which was unanimously agreed to.

The decease of the following Associates was also announced:—Mr. W. Chastel de Boinville, elected 1882; Mr. Cuthbert, elected 1882, and Mr. T. Gordon, elected 1882.

Mr. C. H. Gage was elected as Associate.

### Photographic Records.

Sir BENJAMIN STONE, M.P., gave a brief account of work in connection with the National Photographic Society. He suggested that the preservation of records of buildings, laws and customs was desirable. The popular photography did not necessarily insure this, because there were many wasteful photographers who kept no register of the plates they possessed. He was glad to say a number of selections were being made in various parts of the country, and these would be kept in the country towns.

### Smoke Abatement.

Sir WILLIAM RICHMOND, R.A., then addressed the meeting. He said he would like first to offer his thanks to the Institute.

very generous subscription they had given towards the motion of the work of the Cretan Exploration Society. As honorary treasurer of that Society it was proper for him to turn thanks. He hoped the generous contribution which the Institute had made towards the excavation of one of the most historically interesting discoveries in our time would be an incitement to other bodies, and that they would subscribe in the same way. Dealing with smoke abatement he said that the question was one of the greatest importance in the interests of health as well as of the beauty of our cities. The architects by the very reason of their far-reaching influence as constructors were the men before all others who could help to make cleaner cities. They must all be aware of the irreparable damage done to works of art and architecture by smoke. They had all heard of the damage done to the national garden at Kew by the smoke belched forth from factories in the vicinity. The Institute could give moral support to the city's cause. What had to be provided was a smokeless city, and then all architects should feel themselves bound to insist upon their clients adopting the best possible method of its attainment. In blocks of buildings for the use of the poorer portion of the community hot air might surely be laid on from one heat-generating station, and the houses should be encouraged to cook by gas fires. Although as architects had no more power than anyone else to dictate to the poor how they should live, they had the power to suggest to the county councils, parish councils and others who promoted large workmen's dwellings that heat could be distributed throughout buildings just as gas or water could be. He was quite sure that everyone present as much in earnest as he was, and as the members of the Smoke Abatement Society were, in the desire to protect works of art from destruction, to promote the cause of health and life, and consequently of happiness, and to do individually as well as collectively what lay in their power to make the city they all lived in so well more beautiful and more desirable as a place of habitation for the poor as well as for the rich.

Mr. W. B. RICHMOND then moved the following resolution:—That in view of a resolution of the Smoke Abatement Society recommending the co-operation of the Institute, members are invited in the Society, or that such other assistance be given by the Institute as the Council may deem desirable."

Mr. JOHN SLATER seconded the resolution. He said that the nuisance as evident to Londoners was not caused by many chimneys so much as by the ordinary house grates.

Professor CHURCH, in support of the resolution, described the chemical properties of fog, smoke and the London atmosphere.

Mr. VÉUX, Mr. W. D. CARÖE, Dr. WYLD and Mr. J. B. BETT supported the motion.

The PRESIDENT, in returning thanks to Sir Benjamin Harrison and Sir William Richmond, said the Institute were glad to assist the efforts of the Smoke Abatement Society. The matter would be brought to the notice of the members. The resolution was carried unanimously.

There was on exhibition about 100 photographs of architectural work in the British Isles, forming part of the collections of the National Photographic Record Society prior to their depositing in the British Museum.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

At a meeting of the Edinburgh Architectural Association, held on the 26th ult. in the rooms, 117 George Street—Mr. Stuart Syme presiding—Mr. Robert F. Sherar (of Mr. L. Henderson's staff) read a paper on "Linear Perspective Illustrated by Photography." Mr. Sherar condemned the confusion of ideas expressed by the ambiguous term "picture" and discussed some of the questions arising from this confusion. He described the elementary conditions on which perspective depended, and distinguished between the perspective appearance of objects as we see them and the perspective as we draw them on paper. He showed two photographs of the same building from the same spot—the one on the right-hand side of the photographic plate and the other on the left-hand side—which were quite different in the perspective and explained that they were both equally correct records of perspective appearance as we saw it, but records only. He pointed out the rule that the perspective appearance depended on the position of the spectator, and on this only; and that the perspective image depended on the surface on which it delineated, whether it was a picture plane, vertical or horizontal, or a picture curved as a panorama, &c. In dealing with the distance which a spectator should be from the object in order to produce an agreeable result, he showed three photographs of the east end of Princes Street, showing the Calton Hill in the distance, and said he had often heard it said that photography did not give correct perspective, hills, &c., always coming out too small. The first

photograph above referred to showed the Calton Hill about a quarter of the height of the buildings, the second showed it the same height, and the third showed it twice the height. This, he said, all depended on the distance the spectator or photographer was from the objects to be represented. The choice of this distance, he said, was one of the most important preliminaries of picture-making, whether by photography or other means. No rule could be laid down, except in a general way, in order to guide the artist, the conditions varying so much in each individual case. He laid great stress, however, on the fact that these conditions should be thoroughly understood, and said they were the very things that were not clearly defined in modern books on perspective. The lecture was illustrated by original photographs, diagrams and illustrations of drawings.

## THE NATIONAL GALLERY.

AN altar-piece by Jacopo Pacchiarotto, of the Sienese school, has been purchased for the National Gallery, and is placed in room No. II, in the gallery in Trafalgar Square. The central picture represents the Nativity, with attendant saints; on the frame are six small figures in niche-shaped panels, and below is a predella with five subjects from the Passion of Our Lord.

Mr. Arthur H. Kay, of Glasgow, has presented to the National Gallery a small picture of the interior of a church in Holland by Pieter Saenredam, now hanging in the Exhibition of Old Masters at the Royal Academy. This painter's works are very rare.

The portrait of Baron de Linter of Namur, by Jacob Jordaens, also now in the Exhibition of Old Masters, has been purchased for the National Gallery. None of these three masters has hitherto been represented in the National Collection.

Mr. W. Sandby, of Windsor, has presented to the National Gallery four water-colour drawings by Paul Sandby, and one by Thomas Sandby, all representing architectural subjects. They are hung in the Tate Gallery at Millbank.

## THE MANCHESTER BUILDING BY-LAWS.

THE improvement and buildings committee of the City Council recommend for adoption the new building by-laws which were at the last meeting of the Council sent back to the committee for further consideration. The committee have resolved unanimously, "That the Council be again recommended to make the amended by-laws, which have been formulated and approved in draft by the Local Government Board." In a report on the matter the deputy town clerk states that "the desirability of amending some of the existing by-laws first received consideration by the improvement and buildings committee in April 1897. The amendments had reference to the thickness of walls of domestic buildings; and especially of party walls, the construction of flues, the regulation of roof battens, the adaptation of the dimensions of timbers in common use by builders, provision for ceiling joists, the repeal from the by-law as to open spaces in front of houses with an exception in favour of plans approved before June 22, 1890, which became obsolete in 1893 by reason of the enactment of section 19 of the Manchester Corporation Act, 1891, limiting the operation of approvals to a period of two years; amendment of the by-law respecting down spouts so as to prevent their direct communication with drains; better provision as to ventilation of house drains; better and more complete provision as to the size and ventilation of soil pipes; and an amendment of the by-law relating to plans and sections so as to require them to be prepared in a permanent manner and upon durable material. The amendments have, ever since April 1897, been under the consideration of the improvement and buildings committee, and they have been submitted to and approved by the sanitary committee, the Manchester Society of Architects and the Local Government Board, with whom many conferences and much correspondence have taken place." He further points out "the great desirability of permitting the new by-laws to be brought into operation as early as practicable, having regard to the fact that the committee (contrary to his frequently expressed opinion) have been sanctioning plans in accordance with such amendments."

The London School Board have agreed to raise the maximum salary of the principal clerk of the Works Department from 500*l.* to 600*l.*, that of the assistant architect for buildings and of the assistant architect for repairs from 400*l.* to 450*l.*, and that of the assistant to the measuring surveyor from 300*l.* to 360*l.*, by increments of 15*l.* per annum.

## NOTES AND COMMENTS.

THE interest of the Louvre has now been enhanced by the opening of the rooms which are assigned to the collection of goldsmiths' work bequeathed by the late M. ADOLPHE DE ROTHSCHILD, a collection of drawings by great masters and a collection of pastels. In the first-named is a triptych of immense value from the Abbey of Floreffe, and attractive as a fine example of Flemish art of the thirteenth century. There are also reliquaries, crosses and various ecclesiastical ornaments. A bas-relief in marble of exquisite execution is by AGOSTINO DI DUCCIO, and represents the Madonna and Child. Among the original drawings are examples of DA VINCI, RAPHAEL, MICHEL ANGELO, CORREGGIO, ANDREA DEL SARTO and others. In the Flemish collection is a splendid design by RUBENS. REMBRANDT and other Dutch artists are also represented. Among the pastels those by LA TOUR are perhaps the most prominent. The rooms have been decorated in order to increase the effect, and a great improvement has been effected, for which visitors will be thankful.

FOR some years past Bristol has not presented as many signs of improvement as are generally found in flourishing English towns. If a stranger inquired why the streets were not cleaner it would be sure to be answered that so much money was required at Avonmouth there was nothing left for scavenging. Bristol at one time possessed a monopoly of the imports and exports for the West of England. But younger rivals have arisen, and Bristol has been compelled to succumb to them. It is only by providing superior accommodation for vessels that the old trade has a chance of coming back to the city. In consequence of that necessity the works of the new dock at Dunball Island were started by the Prince of WALES on Wednesday. As the contract has been taken by Sir JOHN AIRD & SONS it is sure to be efficiently carried out. A return of trade would mean more expenditure on the city. Bristol must formerly have been one of the most charming places in England, and no architect can walk through the streets at the present time without feeling how easy it would be to make of Bristol a city that could not fail to be admired and remembered. If the port once more becomes prosperous that end may be attained, for many of the old buildings are lessons in picturesque architecture.

MANY people are willing to agree about the duty of aiding the poor, and especially in obtaining for them convenient dwellings. But abstract propositions and doctrines impose unexpected sacrifices when an attempt is made to put them into practice. A seaside hospital, for example, may be most desirable, but the majority of visitors to a watering-place would not care to encounter the patients every day. This may appear to be selfish conduct, but human nature must be taken as it is, and generous sentiments do not always tally with actions. Ninety-nine out of every hundred people would object if they found that a hospital, or refuge, or benevolent institution were set up opposite their dwelling-houses, and more especially if they were not able to abandon them without suffering loss. The action WRIGHT v. BERRY, which came before Mr. Justice BYRNE on Saturday, will therefore cause some alarm among the purchasers of building plots. An estate was sold at Ealing in 1899 which consisted of 133 large choice plots for private residences. One of the conditions was that "no building of any kind other than a detached or semi-detached house with appropriate offices and outbuildings to be appurtenant thereto or occupied therewith shall be erected on any plot." The plaintiff purchased four plots and on them erected four private dwelling-houses. Two plots immediately opposite were purchased by the defendants, and after a time a notice-board was put up stating that the ground was to be used as a site for a home for poor people, and subscriptions were implored. Some correspondence followed, and eventually it was announced that what was to be erected was a set of self-contained living-rooms to accommodate about fourteen families. The plaintiff was of opinion that his property would be diminished in value by at least 30 per cent., and sought for an injunction to prevent the construction of the buildings. The view taken by the judge was that the buildings which the defendant proposed

to erect were an ordinary eight-roomed house on each plot and it seemed to his Lordship as if the architect designed the buildings in such a way that they could be used at any time as private dwelling-houses. It was proposed user of the buildings that the plaintiff objected to, but that was not mentioned in the motion, and no grievance is only one example among many which arise whenever building estates are laid out. Vendors are eager to sell, especially to the first-comers, in order that the money may not appear to be a failure. The only remedy is either to have stringent building regulations which can be broken unless under a penalty, or for a purchaser to select neighbouring plots which might be used to his disadvantage and to resell them.

AN effort is being made in New York to restrict the number of architects to whom commissions can be given for any kind of municipal buildings. A Bill has been introduced in the Assembly, the character of which can be inferred from the following sections:—"On or before June 1, 1902, the Mayor of the city of New York shall select a list of not less than 100 architects to be proposed to by the Fine Arts Federation of New York, not later than May 1, 1902, at least fifty architects who, in his judgment, are qualified to be entrusted with the design and with the supervision of construction, repair and alteration of public buildings in the said city, and the names of the architects so selected by the Mayor shall be placed on a list to be known as 'The Eligible List of Architects for Municipal Work.' The name of any architect may be removed from the list by the Mayor whenever in his judgment the public interests shall so require. Nothing in this Act shall be construed to prevent the proposal by the Fine Arts Federation of New York for the said eligible list, or the selection by the Mayor, of architects not resident in the city of New York. On or before June 1, 1903, and on or before June 1 in each successive year thereafter, the Mayor may select not more than five architects from a list of not less than fifteen architects to be proposed to him by the Fine Arts Federation of New York on or before May 1 of each year, and may cause their names to be placed on the aforesaid eligible list, until the number of names on the eligible list, exclusive of vacancies arising from death, resignation or removal, shall amount to 100." We assume that the Bill aims at the removal of some architects who have been receiving municipal commissions, as well as the appointment of their successors. It originated with the New York Chapter of the American Institute of Architects and has been endorsed by the Fine Arts Federation.

## ILLUSTRATIONS.

THE LATE JOHN FRANCIS BENTLEY, ARCHITECT OF WESTMINSTER CATHEDRAL, &c.

CATHEDRAL SERIES.—RIPON: THE THREE STONE SEDGECOMBE HOUSE, FAR HEADINGLEY, LEEDS: STAIRCASE. CORNER OF

PAIR OF COTTAGES AT WOODCHURCH, CHESHIRE.

ST. MARY, NEWINGTON, CORONER'S COURT.

THIS court was built on a very irregular site at the corner of a roadway leading out of Manor Walworth Road. The court is about 34 feet long, 12 feet wide, and is lighted from an octagonal lantern, the top of which is 26 feet above the floor. There is a gallery for the public at one end of the court, reached by a flight of stone steps. The seats and tables for the coroner, jurymen and reporters are of oak, the floor is of wood blocks. The mortuary chambers have plate glass next the passage to the jury, the walls are lined with glazed bricks, and the roof is of asphalt. The external walls are faced with bricks, with box-ground Bath stone dressings.

The builders were Messrs. BURMAN & SON, 10, Kennington Park. The architect is Mr. HENRY JAMES.

ALL SAINTS, WEST BROMWICH.

THE carver of the organ-case and stalls was Mr. ADVENT HUNSTONE. The mosaic floor was by Messrs. BURKE & CO.

## CELTIC GOLD ORNAMENTS.

LEGAL and antiquarian circles are beginning to stir themselves, says the *Irish Times*, over the probable outcome of the approaching action which is to be heard in the London Courts, and in which the law officers of the Crown, on the one hand, and the authorities of the British Museum on the other, are the chief litigants. It is anticipated that the case will come on for hearing some time about Easter. Ireland will have an especial interest in the proceedings, inasmuch as the question to be settled is whether a number of old Celtic ornaments now lying in the British Museum shall remain where they are, or shall be transferred to the keeping of the Royal Irish Academy in Dublin. Up to now there is no precedent for the conflict of this kind between the Crown and the British Museum authorities. It may be said that in the long and involved controversy as to who should retain possession of this valuable collection of Celtic ornaments, valuable both from an antiquarian and a financial standpoint, the ruling powers of the British Museum have shown a tenacity and an ingenuity worthy of a better cause. In view of the general public interest which the case is sure to awaken, it will not be out of place to show how the dispute at present stands. Early in 1897, a farm labourer, ploughing the lands of Mr. Joseph Gibson, in the neighbourhood of Limavady, in the North of Ireland, turned up a number of curious old objects, which on subsequent secret examination proved to be (1) a hollow collar in two sections, with elaborate repoussé ornament of eccentric designs; (2) a model boat with eight thwarts (originally nine), a number of oars, spars, &c.; (3) a hemispherical bowl of metal, with four rings at the edges for suspension; (4) a torc of stout wire, with a thinner wire twisted round it; (5) a half of a similar torc; (6) a necklace formed of three twisted chains, with a peculiar fastening; and (7) a thin, single necklace of the same plaiting. After passing through the hands of Mr. Gribben, a jeweller, of Belfast, and Mr. Day, collector of antiquities and a Fellow of the Society of Antiquaries of London, the British Museum authorities, in the autumn of 1897, purchased the collection for 600*l*. In the course of a paper read by Mr. A. J. Evans, keeper of the Ashmolean Museum, Oxford, the following opinion was given as to the discovered character of the articles:—"There is at least no question as to the indigenous Celtic character of the most important relic contained in the Irish hoard. The hollow gold collar, with its bold repoussé designs, is undoubtedly an ancient Irish fabric, and is at the same time the finest example existing of this class of work." In due course, when the real nature of the "find" on Mr. Gibson's farm came to the knowledge of the Irish members of Parliament, and to the authorities of the Royal Irish Academy, a resolution was made that the ornaments were treasure trove, and, as such, should at once be surrendered to the Royal Irish Academy, as the legal guardian of all treasure trove found in Ireland. To this contention the British Museum replied that, the ornaments having been bought in the open market they would not be given up, and that the statutes governing the British Museum explicitly forbade the Museum authorities parting with such possessions, even if they so minded. At this point several discussions took place in the House of Commons, in the course of which it was made plain that both Mr. Balfour and the Attorney-General for Ireland were in sympathy with the claims of the Royal Irish Academy. There was no escape, however, from the fact that the only direct way of compelling the British Museum to give up possession of the articles in dispute was to pass a Bill through Parliament. An enabling Bill was consequently introduced by Mr. William Redmond, but as it was systematically "blocked" by the friends of the British Museum it never stood a chance of becoming law. The next step taken was the appointment by the Government of a special committee in 1899 to examine the whole question. Of this committee Lord Rathmore was chairman, and the membership included Mr. John Morley, Sir John Lubbock, Sir Herbert Maxwell, Sir John Evans and Sir Thomas Esmonde, the last of whom has been a most persistent advocate of the justice of giving these antiquities in Dublin. The report of this committee, taken as a whole, was unquestionably in favour of the claims of the Royal Irish Academy. Still, however, the British Museum stood firm, and its authorities now added a further defence to the one originally put forward, that the ancient and fast lines of their statutes bound their hands and prevented them from allowing anything which they had acquired legally from leaving their custody. The new defence advanced was that the charter issued by Charles I. to the London companies of Ulster gave the right to all treasure trove found within their jurisdiction to these London companies, and as one of these companies, the Royal Irish Academy, acquiesced in the claim of the British Museum, nothing further was to be said. Sir Thomas Esmonde thereupon carefully examined the charter in question, and found that there was no mention of any concession of treasure trove in it, and that nowhere in it did the Crown give

away its rights. A new phase of the struggle was entered on at this discovery. The Irish law officers now came to closer quarters with the holders of the ornaments. They announced that having gone fully into the case they had come to the conclusion that the right to treasure trove in these antiquities vested in the Royal Irish Academy, and they summoned the British Museum people to surrender them at once. Whereupon these tough antagonists retorted that the ornaments, over which the whole fight was being waged, were neither treasure trove nor even Irish. This interposed fresh delay. Finally the Irish law officers, losing all further patience, served legal notice on the Museum authorities to hand over their purchases to the Royal Irish Academy. An additional curt refusal came to hand, with a notification that the Museum would defend its position in the law courts. So the case now stands, the law officers halting for the moment to enable the authorities of the British Museum to file their defence. It is assumed, as I have said, that the actual proceedings in the courts will be reached by Easter.

On Monday, in the House of Commons, Sir T. Esmonde asked the Chancellor of the Exchequer whether he could say out of what fund the legal expenses of the British Museum in the case for the recovery of the Irish gold ornaments were being defrayed; and, in view of the fact that the Irish and the English law officers of the Crown were unanimous in the opinion that these ornaments were illegally retained by the British Museum, and that a demand had been addressed by the Crown to the British Museum to deliver up these ornaments, whether he would see that the legal expenses of the British Museum in connection with the case were not paid out of the public funds.—The Chancellor of the Exchequer in reply said: I understand that the trustees of the British Museum are advised that they have no legal right to give up these ornaments, and that, therefore, they feel they cannot do so without the decision of a Court. In order that the case may be properly placed before the Court it is necessary that some legal expenses should be incurred on behalf of the trustees, which could not properly be charged on the ordinary votes by which the Museum is supported, nor could they be asked to pay such expenses themselves, as, even assuming them to be wrong, they are only acting to the best of their judgment in their official capacity. Their expenses will, therefore, be paid from the vote for law charges.—Sir T. Esmonde also asked the Chancellor of the Exchequer whether he could state when the trial between the Treasury and the British Museum for the recovery of the Irish gold ornaments would take place.—The Chancellor of the Exchequer said he understood that the time given by the Court for the delivery of the defence expired on the 8th inst. It was not possible to state in advance the exact date on which the trial will take place.

## SCOTTISH ART IN THE TURIN EXHIBITION.

AN International Exhibition of Modern Decorative Art is to be held this year in Turin, from April till November. The project, which has received the patronage of the King of Italy, is under the presidency of the Duke of Aosta. A large guarantee fund has been collected by contributions from Turin and from the neighbouring towns, aided by the generosity of the aristocracy and commercial men of the district. The committee is composed of two sections, one artistic, the other administrative. An imposing and extensive building has been erected to house the various exhibits, and every European nation is to be represented. The building has been divided into sections, and these sections have been allocated among the different exhibiting nations. The majority of the continental nations who are contributing have received subsidies from their respective Governments, and this State aid has enabled certain countries to erect and decorate particular buildings and pavilions. Notably has this been done by France, Belgium and Austria. Special sections have been given to England and to Scotland, and to these two countries a sum of money has been respectively voted by the Council of the Exhibition in Turin. In England the delegate appointed is Mr. Walter Crane, who has been assisted in the secretarial duties by Dr. Maris Borsa. Acting under Mr. Crane's direction, the work to be sent from England has been practically confined to that produced by members of the Arts and Crafts Exhibition Society, and most of the better art workers have contributed specimens of their craft. A member of the Executive Council from Turin visited Glasgow in September last, says the *Glasgow Herald*, and Mr. Francis Newbery was appointed delegate for Scotland to collect and select work. Dr. Fernando Agnoletti was associated with him as secretary, and the winter has been spent in obtaining from Scottish art workers the best that was obtainable by their efforts. A scheme of decoration for the Scottish section has been drawn out by Mr. Charles R. Mackintosh, and this scheme is in active progress in Turin. A 7 feet dado of gold and purple goes round the walls of the section the upper

part of the walls and the roof being coloured white. The entire space is broken at intervals by pierced decorative wooden constructions, through which a brightly-coloured stencil is seen. The electric lighting has received special attention in its arrangement, and the decoration of the whole section is to be in itself of the nature of an exhibit, the aim being that the spectator shall on his entrance be at once struck with the treatment. To Mr. Mackintosh and Mrs. Macdonald Mackintosh a space has been reserved, which they are to fill with their exhibits, and the same has been done in the case of the artists, Mr. Herbert M'Nair and Mrs. M'Nair. Mr. James Salmon and Mr. J. Gaff Gillespie take charge of another portion of the section, while yet a fourth space is to be reserved for embroideries and needlework, in which will be seen the work of Mrs. Traquair, Miss Ann Macbeth (medallist at the last "Studio" Exhibition), Miss Beveridge and Mrs. Newbery. Articles of furniture will be grouped at differing spaces along the walls of the section, and cases filled with bookbindings, enamels, metalwork, glass and small "objets d'art" are to be placed in the centre of the floor. Among the enamellists sending work are the names of J. Cromer Watt, of Aberdeen, and Miss Dewar and Miss Harvey, of Glasgow. About a dozen pieces of brightly-coloured pottery are to be spotted over the section. These latter are to be executed and exhibited by Mr. Arnold Fleming. Treatments of ornamental leadwork are to be in the windows, and a section of a carpet from a design by Mrs. Newbery is being executed for the section by the firm of Alexander Morton & Co., of Darvel. The official opening has been fixed for April 26, and probably one or more artists will be deputed to proceed to Turin to arrange the Scottish section.

#### SUBURBAN HOUSES OF NEW YORK.

AT the present time the landowners who are developing under careful restrictions the pleasantest suburbs near New York, says the *Architectural Record*, rarely sell plots which are less than an acre, and while such plots are available only for relatively well-to-do people, it is after all only the relatively well-to-do who, under present conditions, count at all in the process of architectural improvement. As the popular taste for the proprieties of suburban architecture becomes more refined, the size of the average plot upon which the suburban house is built will most assuredly increase, and the tendency will be accelerated by the constantly larger and consequently cheaper amounts of land which will be opened up by improved methods of communication.

The larger building plot would enable the architect to situate the buildings very much further back from the street; it would give him a chance to provide an effective approach, a proper grouping of trees and foliage, a good distribution of spaces, and, in general, a plan for the grounds which was convenient, logical and appropriate. The house would become more of a country house, with a definite place in the landscape, and an arrangement of the grounds which would give its owner a chance by their cultivation and development to take more than a languid or sentimental interest in the soil. At present this is undoubtedly the crudest aspect of American suburban architecture. One sees many suburban houses which must be and are extremely comfortable places in which to live. One sees fewer, but still a good many suburban houses, in which an intelligent attempt has been made to draw an appropriate and well-proportioned façade; but it is a very rare thing to come across a suburban place, no matter how large, in which the grounds have been treated with any kindness or any feeling for landscape architectural effects. A privet hedge outlining the property, a few shrubs scattered promiscuously about, a tree here and there where it has happened to grow, a hydrangea or a bunch of geranium in the midst of the lawn—that is, as a rule, as much landscape gardening or architecture as the ordinary suburban resident needs, and when he seeks for more the result is so flagrant that one inevitably regrets that he had not remained content with less.

This deficiency in the ordinary American suburban and country house is due to the failure of the average American to make any adequate provision for the treatment of his grounds in relation to his house, and the consequent inexperience and lack of training of suburban architects in this class of work. But conditions are likely to improve in this as well as in other respects. Although very few actual results of the demand have as yet been produced, there is a manifestly increasing interest in the appropriate treatment of the grounds; and it is to be expected that in time this interest will have a wholesome and pervasive effect upon all the better grades of suburban architecture. In that event the good suburb will cease to become the commonplace and dreary thing which it now so often is, but the precise forms which the change will take are not easy to predict. In the better American suburbs of the

present time the effect which, by the natural process of tradition, both owner and architect have sought to attain something like that of a New England country town. The streets are lined with two or four rows of elms or maples, the house is separated from the street by a considerable strip of lawn, but no attempt is, as a rule, made to obtain actual privacy, and the walls which so frequently shut off the grounds of the house from the street in a foreign suburb are rarely if ever seen. It is improbable that American neighbourliness will ever consent to the complete separation both from the passers-by and each other which the suburban resident likes; but as the desire for a more formal and architectural treatment of the grounds becomes stronger, it is probable that screens, both of brick and foliage, will be more freely used than at present. The use of such screens have at least one good result. The American suburban resident of the present day not only likes to expose himself and his family to public view, but he has a much less commendable want of reticence about some of his domestic arrangements, such, for instance, as the drying of his laundry—which are either interesting or seemingly objects of public inspection, one of the first reforms of suburban architecture will most assuredly be the more general erection of some effective barrier, behind which the household can dry its linen.

We have already indicated the point of view from which in the past the American suburban house has been so frequently and most flagrantly open to criticism, and that it has not been, architecturally speaking, a country house at all. The one characteristic which should distinguish rural architecture is that of possessing some organic and necessary relation to the land on which it is situated and the landscape by which it is surrounded. This appearance of composing unobtrusively and effectively with their site surroundings has been obtained in rural buildings by various methods. In some of the French country architecture and that of the Italian villas it was obtained by low, simple outlines and masses which fitted the structure snug and close to the land on which it was built. On the other hand, in the English country houses a building which structurally was very well adjusted to its site was given an equally appropriate effect by means of the planting and treatment of the land in which it was, as it were, built up and worked over until it presented a most picturesque, attractive and eminently habitable appearance. The very same thing was frequently done in former times in this country, and the better American architecture in the Colonial period, whatever its defects, was eminently suited to the country in which it was built and the uses to which it was put. But more recently the American country, and particularly the suburban house, has not been informed by any proper feeling as to the kind of building which fitted the land, and the country house will improve just in proportion as this feeling is renewed among suburban architects and their clients.

From 1885 until 1895 the great majority of suburban houses were built in what was known as the Queen Anne style. Surely no style was ever invented which lent itself more to freakish and meaningless eccentricities which are as utterly out of place in rural as they are in every other kind of architecture. A Queen Anne cottage was at best a prettified boudoir building, which in its design was a collection of incongruous and in its effect gave the impression of something put upon the land instead of something growing logically out of it. And the detail was as incongruous and meaningless as the masses and outlines. On the inside the better grade of houses were extremely comfortable, and this fact showed both their designers and owners had most at heart in draught and approving the plans. The outside practically took care of itself, except so far as the piazza was concerned, for the average American's idea of a country or suburban place was a place in which he could sit on a "piazza" and, while reading the Sunday newspaper, "look at the view." The piazza itself was as a rule an appendage which absolutely contradicted a logical and appropriate design. No one will dispute the fact that in the summer climate of America a veranda of some kind is an absolute necessity; but the conception of making a suburban house practically nothing but a comfortable interior and a spacious piazza could have originated only among people whose interest in the country was most external, official and occasional. It is only people who rarely go off to the piazza who could sacrifice the whole building to such an extension into the open air of the interior of the house.

Since 1895 there has been a marked tendency toward improvement in the design of the better class of suburban houses. By the better class of suburban houses we do not mean those that are built by exceptionally wealthy men, but plans by well-known city architects; we mean the suburban house which costs somewhere between 8,000 dollars and 15,000 dollars, and which is as a rule designed either by local architects or perhaps some local builder. As a rule they are not cocked up capriciously in the air, but take their place naturally and smoothly upon the ground. The piazza is

frequently the chief external feature. While it is still in cases unduly prominent, it is either much better managed or design is frankly adapted to it. The roofs are for the part pitched lower, and the outline is not broken by a part of meaningless and fussy gables. The whole design is to be decidedly simpler and more logical, and whatever mental detail there is, is better managed. The buildings in for the most part commonplace, and they are likely to be as successful where they are most original. They indicate rather the prevalence of a better general tradition than training and taste on the part of their individual makers. Several good types of design and material have been introduced by well-known architects, and these types are little more than leavening the whole mass. For Americans are the quick imitative people in the world; and when their civility has a standard to copy which makes an appeal to a sense of excellence, good effects follow with astonishing rapidity.

Generally speaking, it may be said that the designs indicate certain tendencies. In the first place, there is the tendency to rate within bounds of taste and decorum the peculiarities of the Queen Anne cottage. Gables are cut out, the roofs are less inclined and a coherent, modest and decent tendency tends to emerge. More distinctive and dignified effects are, however, obtained by the much more frequent use of colonial forms. The Colonial house had the immense advantage of being a country house of moderate height and good proportions, built by people who lived and not merely slept in the country, and its increased adaptation to modern uses, of which there are many signs, can be productive of nothing but good. Naturally, it is natural that the Elizabethan timbered house should begin to be more extensively used, for it always appeals to people whose taste in architecture is for the quaint and picturesque. Its danger always is the sacrifice of simplicity for good proportions to mere picturesque charm; and it needs softening and moderation of a much more elaborate and dignified treatment of the surrounding land than it has yet received in this country.

That the suburban architect should then try to obtain, in the first place, a good general lay-out of the suburb in which he is interested, the division of the land into plots large enough to give individual surroundings to each particular building, and an architectural treatment of this plot which seems to create an agreeable relation between just that site and just that building. The best that can be said for contemporary suburban architecture is that in individual and selected cases one finds a better plan, larger plots and more seemly buildings; but in general has full architectural advantage been taken of these improved conditions. While architects and owners are feeling their way in the right direction the process of improvement is in its earliest stages.

### THE ORDNANCE SURVEY.

WHEN the Ordnance Survey was first undertaken in 1784, it was merely intended to produce a military map of the southern counties of the kingdom. As the work advanced it fell into general favour as a road map, a travelling map, a map and general geographical map. In 1824 Lord Angle and the Irish members of Parliament came to the conclusion that it would be advisable, in the adaptation of the Ordnance survey to Ireland, to secure some further social advantages, and especially to make it subservient to the proper assessment and collection of the grand jury cess and other taxes in that part of the kingdom. A committee of the House of Commons sat in 1824, which recommended a town-land survey of Ireland on a scale of 6 inches to a mile. That was accordingly adopted. When a portion of Ireland had been completed, the Government was further induced to complete the details of the survey from the boundaries of town-lands to the subdivisions of fields.

In 1840 all England, with the exception of the six northern counties, had been surveyed on the scale of 2 inches, and had been engraved on the scale of 1 inch to a mile, and a portion of Scotland had been previously surveyed on a similar scale.

The survey of Scotland was suspended in 1828, in order that the survey of Ireland might be proceeded with. Previously to that suspension the county of Wigton and one-half of the counties of Ayrshire and Kirkcudbright had been surveyed and drawn for the 1-inch scale, and on the completion of the survey of Ireland in 1840 the survey of Scotland was resumed on the 6-inch scale, which had been found of such great value in the survey of Ireland. Thus the work which had been previously done on the 1-inch scale was thrown away, and the distinction between the peculiar advantages of a 6-inch survey, applicable to the townlands of Ireland in comparison with the larger territorial divisions of Great Britain, was not at that time sufficiently taken into consideration. The survey was

proceeded with in the three counties of Wigton, Kirkcudbright and Edinburgh, which were accordingly mapped and engraved by the Ordnance on the 6-inch scale.

The next step of importance was Lord Elcho's committee on the Scotch survey, which sat in 1851. The state of the case as regards Scotland then was that a 6-inch map had been resolved upon, but no 1-inch map. The question before the committee was simply whether they would have a 6-inch map or a 1-inch map. An alternative between those two maps was the only question proposed to them, and they pronounced in favour of the 1-inch map, on the ground that it was better adapted to geographical purposes, and that the 6-inch map alone was not of sufficient public utility to justify the large expenditure of public money that was required. The committee also appears to have acted under a general impression that by dispensing with the 6-inch scale the 1-inch scale would be more speedily proceeded with.

Orders were given by the Treasury and Ordnance in conformity with the report of that committee. Lancashire, Yorkshire, Kirkcudbrightshire and Edinburghshire, being nearly finished, were ordered to be completed on the 6-inch scale, and the remaining four counties of England and the rest of Scotland were to be done on the 1-inch scale.

These instructions produced the greatest dissatisfaction in Scotland and in the unsurveyed portion of England.

Consequently, in 1852 and 1853, numerous representations were received from commissioners of supply, Royal burghs and various bodies in Scotland, and from the magistrates and others connected with the colliery and mining interests in the North of England, the object of which was to induce the Treasury to rescind the orders which had been given in accordance with the recommendation of the committee of 1851 in favour of the 6-inch scale. Some of these memorials were referred to the Board of Ordnance by the Treasury in June 1852, and a determination was come to by those departments that the survey of Fife, which was at that time going on, should be conducted on the 6-inch scale, and that the question of the scale as to the rest of the country should be reserved for future consideration. Meanwhile the desirableness of an increased scale was much discussed by professional persons, and a more mature knowledge of the subject was arrived at.

In February 1853 Lord Elcho drew up a very able memorandum on the survey which, with numerous letters on the subject, was transmitted, with the Treasury circular letter of April 16, 1853, to a large number of the most experienced and scientific societies and persons in the kingdom, requesting them to state their opinion on the comparative merits of a 6-inch as contrasted against any larger scale for the purposes of a national survey, it being understood that the inch scale would under any circumstances be proceeded with. The replies were as follow:—In favour of the scale of 6 inches, 32; in favour of a larger scale, 120. The weight of authority being in favour of a larger scale, a second circular was addressed to the same parties, requesting them to state what scale they would recommend.

These replies were, by a Treasury minute, dated June 13, 1854, submitted to Sir John Burgoyne, Mr. Blamire and Mr. Rendel, with instructions to report the result of the answers to the Treasury circular of 1853. They unanimously reported that the weight of the evidence in the printed correspondence before them was decidedly in favour of the scale of one two-thousand-five-hundredth part of the linear measure of the ground to be mapped (popularly termed the 25-inch or 1 square inch to 1 acre scale).

Under these circumstances the Treasury determined, by a minute dated July 15, 1854, "That the surveys of Ayrshire and Dumfriesshire should be laid down and drawn on paper on the scale recommended by the committee, *i.e.* of one two-thousand-five-hundredths of the linear measurement of the ground; also that until a final determination should be arrived at as to the scale upon which the Ordnance Survey should be conducted and engraved, the course which has been authorised in reference to Ayrshire and Dumfriesshire should be applied to other districts."

Colonel James was first employed as a director of the Ordnance Survey in 1854. On May 18, 1855, the Treasury recorded a minute, founded on a report and memorandum submitted to them by Colonel James, in relation to the engraving of the Ordnance Survey of Scotland which required immediate steps to be taken, in which their lordships stated that they arrived at the following conclusions:—1. That it is unnecessary to have plans of the Highlands and uncultivated districts on the scale of one two-thousand-five-hundredths, and that the superintendent of the survey should exercise his discretion as to the districts, the plans of which are to be made on that scale. 2. That plans on the one two-thousand-five-hundredths scale should not be engraved, but that copies when wanted should be made by the anastatic process. 3. That the Highland and other partially cultivated and thinly-peopled districts should be drawn on the scale of six inches to a mile, and copies when wanted should be furnished by the anastatic process.

4. That the general map of Scotland on the scale of 1 inch to a mile should be proceeded with as rapidly as possible. 5. That the plans of towns containing more than 4,000 inhabitants should be drawn on the scale of one five-hundredths linear measurement.

Since the Ordnance Survey has been undertaken general attention was more immediately directed to its object. There was a gradual progress of public opinion in favour of conducting it on the larger scale of 25 inches to a mile, equal to 1 inch to an acre. This was ably explained by Sir Roderick Murchison, Sir John Burgoyne and Sir C. Trevelyan, who all concurred in stating that the further the larger survey had proceeded the more they had become prepossessed in its favour. It is likewise worthy of observation that at Aldershot, Portsmouth and in several places in the South of England previously surveyed on the 1-inch scale, a re-survey on a scale of 25 inches to the mile has been found essential for military purposes.

The idea of a cadastral survey of 25 inches originated with Delambre and Laplace in 1793. A commission, of which they were members, recommended it to Napoleon in 1807, who adopted it, and carried out the survey of France upon that scale with signal success. It appears that the proposal to adopt the 25-inch scale in Great Britain originated with Colonel Dawson, attached to the Tithe and Inclosure Commission, who stated that had his suggestions been adopted in 1837, when the 1-inch Ordnance maps were found utterly inapplicable to and useless for the purposes of the Tithe Commission, an expense of 3,529,830*l.* might have been saved to the country, besides a further considerable outlay in respect of surveys for roads, canals, water supply and the sale and transfer of property, which he had no means of estimating.

## ARCHITECTURAL TREATMENT OF BRIDGES.

A LECTURE on "The Architectural Treatment of Bridges" was delivered at Carpenters' Hall, London Wall, on the 27th ult. by Mr. H. Heathcote Statham. Mr. Aston Webb, A.R.A., presided, and there was a large attendance.

Mr. Statham said that the subject of the architectural treatment of bridges was essentially modern, for the reason that until the nineteenth century bridges were built for the most part as utilitarian structures. In recent times it had been perceived that bridges might have architectural importance, good or bad. Bridges could be grouped under the headings of stone, steel with stone piles, steel alone, and wooden. There was something to be said for those included in the last heading, namely, that they were picturesque, for they could hardly help being so. To illustrate this point, pictures of old Putney Bridge, Jenny's Whim Bridge, a Japanese bridge and others were thrown on the screen. He put in a plea that some of the old wooden bridges up the Thames might be allowed to remain, because they added greatly to the beauty of the river and were much to be preferred to ugly iron structures, which unnecessarily spoil the river scenery. With regard to steel bridges, he divided them into beam, suspension and trussed bridges, and said that the less ornament there was in them the better. Pure structure was never in bad taste, and he thought that much of the public criticism of engineers of iron bridges was uncalled for and absurd. Several examples of beam bridges were shown, and included a bridge at Rotterdam and Britannia and Saltash bridges. In the construction of suspension bridges, he said that beauty was an essential characteristic, and after referring to the simplicity of Hungerford Bridge, now Clifton Bridge, and others, Mr. Statham called attention to the bad ornamentation on Hammersmith Bridge, contrasting it with the superior order of the art in French bridges. In dealing with the Tower Bridge he styled the architecture as that of mistaken Mediaevalism. Among trussed bridges he mentioned Richmond railway bridge as one of the most pleasing about London. There was, however, much to be said for that at Southwark, which was a real cast-iron arch. The great advantage of cantilever bridges was that an enormous space could be spanned by them. He gave as examples the Forth Bridge and a very crude structure by North American Indians over a ravine in Canada, an instance of the unconscious use of the cantilever principle by uncivilised man. After dealing with the structure of several bridges which formed the connecting link between stone and steel bridges, he spoke of design, dealing first with the treatment of arches and then with cutwaters. As to the treatment of piers, he said that in modern times there seemed to be a notion that the correct thing to do was to place a column with a capital on it. The piers of Blackfriars Bridge were, in his opinion, perfectly out of place, and were designed, it would seem, for the purpose of carrying a superstructure. Piers should properly be buttresses, and if an order were introduced it should be proportioned to its position and apparent work. Views of Lynmouth, Wallingford, old Westminster and old Blackfriars bridges were shown as illustrating

the various forms of arches. With reference to London Bridge, which was one of the finest bridges ever built, he expressed the view that the proposed alterations would spoil the look of the bridge. He regretted that it was thought necessary to make any alteration, for it had not been shown that it was practically required. He then remarked upon the detail of the piers of Vauxhall Bridge, and showed views of design. In conclusion, he said that the real treatment of bridges was to be found in the adoption of Gothic principles even if Classic details were used.

The Chairman, in moving a vote of thanks to Mr. Statham, said it was very important that they should have right notions as to how a bridge should be built, and also how it was to be kept. With regard to London Bridge, he was quite sure that they would all agree with the lecturer that the alterations were unnecessary. If, however, those alterations were to be carried out, he thought they were entitled to know what was going to be done, and they ought to be in a position to form an opinion as to what was the correct thing to do. At the present time they must give way to the French as the great bridge builders. The new bridge constructed for the Paris Exhibition was a magnificent structure, and he only hoped that Vauxhall Bridge would be built in some way to vie with it.

The motion was carried and the proceedings terminated.

## BRITISH MUSEUM.

IT is understood that the problem of how to provide sufficient accommodation at the British Museum for the rapidly accumulating mass of old newspapers has at length been solved, the trustees, says the *Times*, having obtained the sanction of the Treasury to the establishment of a separate branch of the Museum at Hendon for the storage of this class of material. It may be recalled that the British Museum submitted to Parliament two years ago would have empowered the trustees to "make and give effect to arrangements with the council of any county or borough (including the town council or borough commissioners of any burgh or parishes in Scotland) for placing in the custody of the council copies of any newspaper published in or near the county or borough, which have been received by the trustees since the year 1837, or which may be hereafter received by them. Every council shall make due provision for the preservation of copies so placed in their custody." This proposal, however, was so strongly opposed by those having practical acquaintance with the subject that, although the House of Lords passed a Bill, it had to be dropped; and the alternative scheme adopted may be regarded as an evidence that the objection to a plan of decentralisation has been finally abandoned. The total estimated cost of the new building and of the site upon which it is to be erected is 18,000*l.*, of which 3,000*l.* will be provided in the Civil Service Estimates for 1902-03. It is intended that students wishing to refer to old newspapers shall be put to the inconvenience of making special visits to Hendon for the purpose, the suggestion being that a notice shall be required in order that the volume to be consulted may be brought to the Museum headquarters at Bloomsbury.

## THE DISCOVERY AT ST. JAMES'S PALACE.

ST. JAMES'S PALACE and the adjoining Park, says the *Standard*, are closely associated with monastic institutions. Not far from the Palace stood what was certainly the last Roman Catholic foundation by an English Sovereign, probably the last monastic house in London before the Reformation in the middle of the nineteenth century. This was occupied by a community of Benedictines established by James II., which, of course, did not survive that monarch's flight, and the accession of William III. in 1688. Some twenty years earlier than this, on a site not far from where Marlborough House now stands, there was built for Catherine of Braganza, the wife of Charles II., a house of Capuchin friars. Cardinal Howard, the Queen's almoner, took Pepys "through the whole house and chapel and new monastery," and the immortal diarist, in his record of the visit, shows himself more than usually pious. He is quite unable to appreciate the spirit of monasticism, which, whether one approves of it or not, must be admitted to have a lofty ideal—the individual working out his own salvation by means of the moral or material service of the community. Of this Pepys sees nothing, or, at any rate, says nothing. He notes the meat roasting at the fire, goes into the cell of one of the fathers and remarks that it was very clean, "hung with pictures and set with books," and then wished that he were a Capuchin friar. Of the inner life he was ignorant, and the sincerity of his wish may be gauged by the fact that on the same day he went to the King's House and saw Nell Gwynne play Beaumont and Fletcher's "Humorous Lieutenant." Evidently, more than these houses by six or seven hundred years was

hospital of St. James the Less, some of the stonework of which was uncovered in 1838, when part of the Chapel Royal was taken down. There is little reason to doubt that the human remains met with in the course of the recent excavations in one of the courtyards are those of some of the inmates. The precise origin of the house is lost in the mist of ages, and the earlier incorporating has been searched for in vain. According to Dugdale, who quotes from Tanner's "Notitia Monastica," the hospital was founded in the fields near Westminster by some well-disposed citizens of London "beyond the memory of man and (as some think) before the Conquest," for fourteen maidens that were leprous. Afterwards eight brethren were added. It seems to have been fairly well endowed, for Stow says that it had two hides of land, with the usual appurtenances of the parish of St. Margaret, to which sundry devout men of London added "six-and-fifty pounds rents," while other devout persons bestowed on it four hides of land at Westminster and eight acres of land and wood in Hendon, Chalcote and Hampstead. The house was rebuilt in the reign of Henry III., so that the Norman stonework found in 1838 would appear to have belonged to an earlier structure. Edward I. granted the community the privileges of a seven days' fair, which is the origin of the famous May Fair, formerly held in the fields near Piccadilly. The government was in the hands of a master, and of these officers Dugdale records one, the first in the reign of Edward III. and the last in that of Henry VI., who granted the perpetual custody of the foundation to Eton College, by which it was surrendered to Henry VIII. in the twenty-third year of his reign in exchange for Chattisham and other lands in Suffolk, and was then valued at 100*l.* a year. That ended its existence, for the king pulled down the old structure and erected on the site what Stow calls "a goodly manor," of which the gatehouse and turrets facing James's Street are all that remains. There is no record as to the exact status—secular or regular—of the clerics who had the cure of souls of these leprous maidens. But in support of the view that they belonged to the regular clergy, it may be alleged that the Benedictine abbots of Westminster claimed jurisdiction over them, and that the leper-house of St. Giles's, founded in 1118 by Matilda, wife of Henry I., was a cell of the London Lazars, in Leicestershire, which was in turn subject to the house of St. John of Jerusalem. How great a scourge leprosy was in this country in the Middle Ages may be gathered from the fact that about twenty foundations similar to the leper-house of St. James the Less have been traced. The traditions of these houses must have been animated by the same spirit which impelled Father Damien to dedicate his life to the service of the lepers of the Pacific, and won for him the title of the "Martyr of Molokai."

The coffin and skeleton discovered in Colour Court, St. James's Palace, were removed on Saturday to the British Museum.

A correspondent of the *Times* writes:—The lead coffin which was found last week in the soil of the Colour Court at St. James's Palace contained nothing but the remains of the skeleton of a powerful man some 5 feet 10 inches high. The continued damp, and perhaps some acids in the ground, had dissolved the lower portion of the lead to waste away, and bits of the skeleton had perished and passed through the opening. There was no metal remaining attached to the body which might give a clue to the date of sepulture. The remains were sealed and buried. The upper slab of the coffin was in good order, and carried a cross in raised ropework, extending to full length and breadth. The coffin was found in the layer of soil only 2 feet lower than that disturbed some forty years ago for the insertion of a water-pipe to the main building. Scattered bones have been found throughout the excavations, and these are being collected and reburied.

Another correspondent writes:—Although, owing to various circumstances, it is practically impossible to fix the date of the interment by the condition of human bones, yet, within the precincts of such an historic building as St. James's Palace, it might not be very difficult to decide whether the burial-place recently disturbed belongs to monastic times or is of a later date. This is no doubt being considered in connection with the exact spot where the discovery has been made, and the relics besides bones which may have been unearthed. The fact that one body has been found wrapped in a leaden shroud of unusual shape would hardly seem to be sufficient to warrant its being considered that of a Mediæval monk, for at all times and in many places special persons have been buried in an individual manner. In old palaces and houses such as St. James's, used successively by different Royal and noble persons and their households, it was quite usual to set aside a portion of the premises, sometimes an open piece of ground and sometimes vaults under a portion of the buildings, for the interment of members of the household. The Savoy and Somerset House are cases in point. But it is by no means improbable, as suggested in your paragraph in to-day's issue, that the spot recently discovered may have been a burial-place belonging to the ancient almshouse

or hospital of St. James's, originally founded for the reception of "fourteen sisters, maidens, that were leprous, living chastely and honestly in Divine service," and acquired about 1532 by Henry VIII. Some remains of St. James's Hospital have been found, according to the Rev. W. J. Loftie, in Arlington Street, which is a little distance from the Palace. The insanitary practice of monastic times of burying the dead in the midst of the living is, curiously enough, surviving still. For although we can hardly believe that it would be permitted now to use as a burial-ground a portion of the garden of any ordinary town school or institution, yet this is being done in certain Roman Catholic establishments in populous parts of London, as well as in the suburbs and the provinces; and it is a little difficult to understand why in places such as present-day nunneries, to which it is so exceptionally difficult to obtain access for inspection, the Home Secretary still gives permission for old burial-grounds to be used and new ones to be formed.

It is to be hoped that further discoveries in St. James's Palace may lead to the settlement of the question as to the approximate date of this interesting place of interment.

### THE ROMAN SETTLEMENT AT CLAUSENTUM.

At a recent meeting of the Society of Antiquaries in London a paper was read by Mr. William Dale, F.S.A., of Southampton, on discoveries made at Clausentum, near Southampton. About a year ago, when Bitterne Manor began to be handed over to the builders, interest was aroused in the matter in London, and in May last Mr. George E. Fox, F.S.A., director of the Silchester explorations, and Mr. St. John Hope, secretary of the Society of Antiquaries, paid a special visit to the spot, and the following report was drawn up:—

"The site of the Roman station in question is on a peninsula formed by two bends of the river Itchen, about two miles above the junction of that river with the Southampton Water. Across this peninsula at its broadest part, which is towards the east, runs a wide fosse from bend to bend of the river, cutting off a triangular area roughly 27½ acres in extent, the point of which is to the west, the base being to the east. In a somewhat parallel direction to this trench, but 800 feet to the west of it, another trench crosses the area, parting off the end of the triangle, and forming, with the river on the other two sides, a second enclosure. It is this smaller enclosure which is the station proper, and its triangular area may be roughly estimated at 6½ acres. Towards the river it is margined by a wide foreshore and was apparently fortified on all three sides by a wall, the trench last mentioned running in front of the landward wall. Of the walls there appear to be now no visible remains, but such remains, and also those of bastions, probably one at each angle, are mentioned by Sir Henry Englefield in his work entitled 'A Walk Round Southampton,' published at the beginning of the nineteenth century. It seems that this second enclosure, which contains Bitterne Manor House and grounds, will not be touched for another two years, but that the space between the eastern line of the Roman station and the fosse across the base of the peninsula will be taken in hand first. Trial holes have been dug in it at different places. None of these which had been dug in the ground south of the modern road, which traverses the site from west to east showed, as far as I and Mr. Hope, who accompanied me, could see, any signs of Roman material. The vegetable soil was shallow, and beneath it lay river shingle, but from the two holes in the area north of the road mentioned, where the vegetable soil was deeper, shards of pottery, both common and of pseudo-Samian, had been cast up, and we picked up a fragment of flue tile and an indecipherable bronze Roman coin on one of the heaps by them. Calling at the Manor House, we were permitted to see what remains were preserved there and in the grounds. These are of little importance, with the exception of some of the inscribed and carved stones which are preserved in a summer-house in the garden. The latter are all figured in Sir H. Englefield's work. With respect to the question of excavation on the site, it seemed both to Mr. Hope and myself that there are some points in the portion immediately threatened by building operations which would repay exploration. These are marked A, B, C, D, E on the accompanying plan. I would submit that it would be advisable by sections at the spots so marked to ascertain the nature of the outer defence, and also to find if possible the remains of the south-east corner of the station wall—perhaps at where there might have been a bastion. As the new street and houses will completely efface the outer fosse at some not distant period, the examination of the points marked should be the first to be undertaken. Whether any trenching of the area between the outer line of defence and the station wall west of it would repay the trouble and expense incurred in doing it is a matter of some doubt, but at least it might be recommended that someone should watch

the building operations on the site when they are fairly undertaken. As to the area of the station proper, when the time came for it it might be well worth excavation. Only the portion of the site more immediately threatened is dealt with here. In the appended plan the red lines show the directions of the outer defence and the lines of the walls of the station so far as they can be conjectured. The pink tint marks the width of the foreshore on the two sides of the enclosure next the river, and the dotted area is that on which building operations have already been commenced. As mentioned, the area of the station proper is not yet threatened, except a small portion at the south-east corner." This report is signed by Mr. Fox.

Nothing further was done in the matter until the autumn, when the treasurer of the Society wrote to Mr. Dale to say that 20% had been voted by the Society for the purpose of exploration, provided it could be used to advantage. By this time, however, the new roads had been made and several houses built, and Mr. Dale did not think that the time had yet come for the formation of a committee or the spending of money in trial diggings. In his paper Mr. Dale described the position of the new roads on the six-inch Ordnance map, and said that in making them the ground had been as well sampled as any trial trenches could do. In the area between the outer and inner fosse the soil was thin, and the subsoil of river gravel was soon reached. A few coins, some lumps of Bembridge limestone and shards of common pottery and brick were found, and near the northern foreshore two big pieces of limestone looked like the remains of a wall. Within the triangular inner area, which was the true Roman fort, there was more of interest. Here the soil is thick and black, and in digging the foundations of the houses there was ample evidence of Roman occupation. Coins are always so common at Roman stations that they are of no great value, and a great many were found here—Vespasian, Domitian, Diocletian, Crispus, Trojan, Claudius, Gallienus, Magnentius, Constans, Faustina, Hadrian, Valens, Constantine Max, Tetricus 1 and 2, Carausius and Allectus were all represented. Several denarii of Antoninus Pius were found and a denarius of Caligula and Augustus, which is a scarce coin. There were also a good many bronze objects, several fibula, a spatula, a lamp hook and other small articles. Concerning the coins, Mr. Dale said that it was thought by some that a mint existed at Clausentum, although Mr. Haverfield, one of our great Roman authorities, will not have it. The letter C on the coins of Allectus refers either to Camelodunum (Colchester) or Clausentum. The coins of Allectus lately found at Clausentum were shown to Sir John Evans, and he said he was inclined to give the Hampshire people the benefit of the doubt, but hoped more would be found. Much pottery, bricks and a few flue tiles were turned out. A good deal of the pottery was coarse, but there was some of the Aretine ware, which was made abroad. It has embossed figures upon it. Sir Hy. Englefield in his "Walk Round Southampton" mentions the occurrence of this ware, and gives a list of potters' names found upon it. Several of the pieces exhibited by Mr. Dale had names upon them, but none of those mentioned by Sir Hy. Englefield. In cutting the road across the inner fosse, a neat little black pot was found quite perfect, and covered with a lid. It did not contain anything but earth. Nowhere in the course of the digging had any foundations of buildings been discovered. Several non-Roman objects were discovered, a penny of Henry III., a neolithic implement, and an urn burial of the bronze age. In concluding his paper, Mr. Dale said that at present he thought no local committee need be formed, but later on, when the ground near the Manor House is touched, it might be desirable to take united action.

A discussion followed, in which Sir Henry Howarth, M.P., the Rev. H. Engleheart and others took part. Mr. Engleheart referred to the fact that the coins of Vespasian found at Clausentum were always well preserved. He said there was a tradition that this Emperor landed in the Isle of Wight, and he may have had his station at Clausentum.

The President thanked the reader of the paper for the trouble taken, and also for the interesting exhibition of articles found.

## TESSERÆ.

### Positions of Temples.

VITRUVIUS teaches us the peculiar situations and aspects which the Greeks selected for their temples, but we are bound to state that there are numerous exceptions to his rules. According to this authority, however, the situations were regulated chiefly by the nature and characteristics of the various divinities. Thus the temples of Jupiter, Juno and Minerva, who were considered by the inhabitants of many cities as their protecting deities, were erected on spots sufficiently elevated to enable them to overlook the whole town, or at least the principal part of it. Minerva, the tutelary deity of Athens, had her seat on the Acropolis, so that all those who arrived in the city might behold it while yet afar off. The temples of

Mercury were ordinarily in the Forum, or otherwise, like those of Isis and Serapis among the Egyptians, in the market-places. Those of Apollo and Bacchus were placed beside the theatre. The temple of Hercules was commonly built near the gymnasium, the amphitheatre, or circus. Those of Mars, of Venus and of Vulcan, had their place generally without the walls of the city, but near the gates. The temples of Ceres were likewise placed, in most instances, outside the town in a retired and quiet place, and were visited by few persons except such as were initiated into the mysteries of her worship. The Greeks rarely placed the temples of Vesta without the walls, and on the contrary were accustomed to select for them the most commodious and beautiful sites. The temples of Esculapius, however, were uniformly built in the neighbourhood of the towns, on some elevated and desirable spot, where the pure air might be inhaled by the invalids who came to invoke the aid of the god of health. In order, says Vitruvius, to give to the temples the most convenient direction relatively to all the quarters of the horizon, the architects so constructed them as to admit of the statues of the divinity in the cella being turned towards the east, to which quarter all those who came to pray or sacrifice likewise bent their regard. When a temple was situated beside a river its principal façade faced the stream. A similar system was also observed with respect to such as were erected beside the public ways. Sometimes the particular spot on which the temple was erected had been pointed out by an oracle or presage. In the cities the houses of the inhabitants clustered round the temples: from this observation, however, we must except the citizens of Sanagra in Boeotia, who separated their dwellings altogether from the vicinity of the temples, which were constructed on spots perfectly apart from the carrying on of any civic occupations.

### Sir William Chambers.

At the age of sixteen William Chambers was appointed supercargo in a ship belonging to the East India Company, and it is said he held the post for five or six years. Abandoning, however, his commercial pursuits, says Hardwicke, pupil and biographer, he followed the natural bent of his genius and travelled into Italy, for the purpose of studying the science of architecture, not only by measuring and drawing the invaluable remains of antiquity, but likewise the admirable productions of the revivers of the arts which distinguished the fifteenth and sixteenth centuries. He carefully examined and studied, with unwearied application, the works of Michel Angelo, Sangallo, Palladio, Scamozzi, Vignola, Peruzzi, Sanmichele, Bernini and other Italian architects, whose designs were in general guided by the rules of the ancients, but whose extraordinary talents, exalting them above the character of mere imitators, produced an originality in their compositions that fully established their fame, and pointed them out as the fittest models for succeeding artists. Chambers knew how to distinguish and to combine all the excellences of the great men, and his intuitive good taste and sound judgment led him also to examine into the merits of those French architects whose productions have since been so much esteemed and applauded, among whom Claude Perrault and Jules Mansard held the most distinguished rank. At Paris he studied under the celebrated Clérissieu, and acquired from him a freedom of pencil in which few excelled him. Having made himself acquainted with Roman art, he supposed he knew enough; so without visiting Sicily, where Greek architecture abounded, he returned to England, and taking a house in Portico Street, commenced the profession of an architect. There was a tradition that poverty obliged him to quit Italy, but it is certain that the story of his having wrought as a carpenter on his arrival in London is without foundation. This latter could never have been a credible one; a man cannot be a carpenter when he chooses, he must learn the trade before he can hope for employment, and, moreover, Chambers was an accomplished draughtsman, and as such must always have been able to command bread. To his skill as a draughtsman he added a certain agreeable and winning way, partly the result of nature and partly the result of his intercourse with the world, which assisted him in the pursuit of notice and patronage; nor did accident, to which we all owe more than we care to acknowledge, refuse to lend him a helping hand. A taste in architecture was wanted for the Prince, afterwards George III., and the Earl of Bute was informed by John James Oglethorpe of York, whom he consulted, that Chambers was very skilful and his conversation and manners not only unexceptional but inviting. All this and more was confirmed to Lord Bute by a personal interview. Chambers was introduced to the Prince, who became in the course of his studies so attached to him that, on his accession to the throne, he appointed him royal architect, and promoted his interest on all occasions.

### Artists and Artisans.

The Greeks and Romans do not seem to have distinguished by names the difference between the artist and the artisan, the workman, *teknites* with the one and *artifex* with the other.

being indifferently applied to either. The Italians, on the contrary, appear to have been the first to give them their just appellations. "Artista," says Milizia, "è chi esercita le belle arti. Artigiano è chi pratica qualche arte meccanica." The words have come to our language through the French, with the Italian or proper meaning. An artist is one who professes to practise a liberal art, an artisan one who follows or exercises a mechanical trade. The mason, the bricklayer, the carpenter, the smith, the house-painter, the paperhanger, the room decorator and such like, are artisans; the architect, the sculptor, the painter, the engraver, &c., are artists. For too great a length of time have artisans been permitted to usurp the title of artists—a name which they have assumed, perhaps, because they follow some inferior branch of art carried on after the manner of a trade. But it is time that the correct definition of the word should be adhered to, and that the honourable title of an artist should only be allowed to such who practise a liberal art after a liberal manner. Custom in England does not give the name of artist to the poet, the musician or the comedian, although the arts which these professors exercise are liberal in the fullest extent of the word, because their own distinctive titles are sufficiently high and specific, and because, perhaps, that the professions of the painter, the sculptor, the architect and the engraver, with their several subordinate departments, have each of them a certain portion of mechanical art, and are of more obvious and immediate use to the community, while the art of the poet, the musician, the dramatist have nothing, or at least should have nothing of mechanical art, or what was formerly termed handy work, the *artes manuarie* of the Latins, to distinguish them from the *artes liberales* in them, and are more the results of the wants of the mind or sentiment than of the body, in France the custom is somewhat different, for in the vocabulary of its language, the comedian, the pantomimist, the dancer, the juggler, the cook, the hairdresser are all artists. This honourable title should not, however, be thus indiscriminately prostituted, but bestowed after the manner of the great men of the best days of Italian art and literature upon the professors of the fine arts only, and then only upon such as practise them as an art and do not mix them up with trade, or lower them by their practice to assimilate with the most sordid parts of commerce. The builder should not be called an architect, nor should the sign-painter, the figure caster or plasterer, the chair sculptor, commonly called cabinet-maker, the paperhanger and wall decorator be called artists. Their proper appellation, artisan or tradesman, and the certain profit attendant on all their labours are sufficient to their exertions, because their employment does not consist in the exercise of the higher faculties of the mind, but in practising lower departments of art, or in executing the thoughts, the designs of others, without possessing that ardour, that enthusiasm, those sentiments and feelings for the sublime and beautiful in art, that sensibility which approaches to or rises in the aid of poetry and nourishes a brilliant fancy, and these indescribable faculties of the mind which alone can constitute the artist.

#### Tintoretto's Methods.

The nocturnal studies of Tintoretto from models and artificial groups have been celebrated; these, prepared in wax or clay, he arranged, raised, suspended, to produce masses, shortening and variety of effect. It was thence he acquired that decision of chiaroscuro unknown to more expanded daylight, by which he divided his bodies, and those wings of purity and light by which he separated the groups of his composition, though the mellowness of his eye nearly always instructed him to connect the two extremes by something intermediate that partook of both, as the extremes themselves by the reflexes with the background or the scenery. The general rapidity of his process, by which he baffled his competitors, and often overwhelmed himself, did not indeed always permit him to attend deliberately to this principle, and often hurried him into an abuse of practice which in the lights turned breadth into mannered or insipid flatness, and in the shadows into total extinction of parts. Of all this he has, in the schools of San Rocco and Marco, given the most unquestionable instances; the Resurrection of Christ and the Massacre of the Innocents comprehend every charm by which chiaroscuro animates its votaries. In the Vision dewy dawn melts into deep but pellucid shade, itself rent or reflected by celestial splendour and angelic hues, whilst in the Infant-massacre at Bethlehem alternate sheets of stormy light and agitated gloom and horror on the astonished eye. He pursued, however, another method to create, without more assistance from chiaroscuro than individual light and shade, an effect equivalent, and perhaps superior, to what the utmost stretch of its powers could have produced in the Crucifixion of the Virgin or Guest Room of San Rocco, the largest and most celebrated of his works. The multitudinous rabble dispersed about that picture (for such, rather than composition, one group accepted, that assemblage of accidental figures deserves to be called), he connected by a sovereign tone, engulfing the whole

in one mass of ominous twilight, an eclipse, or what precedes a storm or hurricane or earthquake, nor suffering the captive eye to rest on any other object than the faint gleam hovering over the head of the Saviour in the centre, and in still fainter tones dying on the sainted group gathered beneath the cross. Yet this nearly superhuman contrivance, which raises above admiration a work whose incongruous parts else must have sunk it beneath mediocrity, Agostino Carracci in his print, with chalcographic callus, has totally overlooked, for notwithstanding the iron sky that overhangs the whole, he has spread, if not sunshine, the most declared daylight from end to end, nor left the eye uninformed of one motley article or one blade of grass.

#### The Duke of Richmond's Academy.

In the year 1758 the Duke of Richmond opened a gallery of casts from the antique, in Whitehall, forming an academy or gratuitous school of design for young artists, and he established premiums for the best design. This school was under the management of Cipriani for drawing, and Wilton for sculpture or modelling; but, like its predecessors, its existence was of short duration, and its ultimate effect was in proportion, though probably to many young artists individually it was of considerable benefit. An advertisement notifying the opening of this gallery "for the use of those who study painting, sculpture and engraving," appeared in the *Chronicle* of February 25, 1758. Youths under the age of twelve were not admitted—a proper restriction; but the age of fifteen would perhaps have been better, for to the practice of schooling children into the professional use of the pencil, when they are scarcely strong enough to hold it firmly, to teach them to draw sometimes before they have well learnt to read, may be attributed the too frequent general incapacity of the mature artist in after life. Shortly, however, after the opening of this gallery an impudent placard, posted upon the door, forced the duke to close it again. The cause of the placard was the duke's omitting to award the promised premiums. It was the time of the third Silesian or Seven Years' War, and he was called away suddenly to join his regiment on the Continent, and in his absence the premiums were not given. When he returned he found a sarcastic placard, in his own name, upon the door of his gallery, apologising for his poverty, and expressing his sorrow for having promised rewards which he could not pay. He immediately closed the gallery; he, however, opened it again after a little time, and placed it under the superintendence of the newly incorporated Society of Artists, at the request of that society; but it was gradually less frequently attended, until it was finally wholly superseded by the foundation of the Royal Academy in 1768. It remained open, however, some years after that event.

#### Early Marine Charts.

Fournier ascribes the invention of charts to Henry, son of John, king of Portugal; certain it is that marine charts appear first to have issued from the Portuguese. Bagford says the first step that was made toward a knowledge of our own coasts was by an almanac, with a chart of the coasting part of England printed on vellum or parchment, by Wynken de Worde, 1520, and bound in a small portable volume. This was the first he had seen of the kind. John Rotz, a native of Dieppe, and servant to King Henry VIII., made for the king's use a book of Hydrography, so called, being an account of the compass, elevation of the pole, latitude, sea coasts, &c., 1542, finely painted on eighteen very large skins of parchment, still preserved among the royal manuscripts in the British Museum. Of this description also is a very curious chart, preserved in the same collection, formerly belonging to Lord Oxford, and probably of as early if not an earlier date than Rotz's charts. New Holland is laid down upon it as an island, under the name of Java le Grand. Captain Flinders when asked for his opinion whether this portion of the chart could have been laid down from actual observation, answered, "Most certainly, for lines of red dots are made to border the coast exactly to the extent to which it is coral-bound and no further; I was wrecked upon one of those reefs and have reason to remember them." The names of places are occasionally given upon the different shores in this chart in French, and the very spot upon it which Captain Cook afterwards named Botany Bay is designated as Côte des Herbages. The generality of the early Portuguese charts seem to have been made toward the close of the fifteenth century.

#### Rubens's Freedom.

No man ever more completely laid the reins on the neck of his inclinations, no man ever more fearlessly abandoned himself to his own sensations, and, depending on them, dared to attempt extraordinary things, than Rubens. To this, in a great measure, must be attributed that perfect originality of manner by which the limits of the art may be said to be extended. Endowed with a full comprehension of his own character, he waited not a moment for the acquisition of what he perhaps deemed incompatible excellence. His theory once

formed, he seldom looked abroad for assistance; there is, consequently, in his works very little that appears to be taken from other masters, and, if he has occasionally stolen anything, he has so well digested and adapted it to the rest of his composition that the theft is not discoverable. But, though it must be allowed that he possessed, in many respects, the true art of imitation, though he looked at nature with a true painter's eye, and saw at once the characteristic feature by which every object is distinguished, and rendered it at once on canvas with a vivacity of touch truly astonishing; though his powers of grouping and combining his objects into a whole, and forming his masses of light and shade and colour, have never been equalled; and though the general animation and energy of his attitudes, and the flowing liberty of his outline, all contribute to arrest the attention and inspire a portion of that enthusiasm by which the painter was absorbed and carried away, yet the spectator will at last awake from the trance, his eyes will cease to be dazzled, and then he will not fail to lament that such extraordinary powers were so often misapplied, if not entirely cast away; he will inquire why Rubens was content to want so many requisites to the perfection of art, why he paid no greater attention to elegance and correctness of form, to grace, beauty, dignity and propriety of character—why every subject, of whatever class, is equally adorned with the gay colours of spring, and every figure in his compositions indiscriminately fed on roses. Nor will he be satisfied with the ingenious, but surely unfounded, apology that these faults harmonise with his style, and were necessary to its complete uniformity; that his taste in design appears to correspond better with his colouring and composition than if he had adopted a more correct and refined style of drawing; and that, perhaps, in painting, as in personal attractions, there is a certain agreement and correspondence of parts in the whole together, which is often more captivating than mere regular beauty.

#### Roman Curtains.

The Roman judges in criminal causes were in the habit of having a curtain raised before their tribunal, in order to admit of their discussing the subjects in their hands with freedom and secrecy. In cases of minor interest and importance the veil was left undrawn, and hence arose the two Latin expressions—*ad vela sisti* to denote the curtain being drawn, and *levato velo* to specify an open investigation. In the temples a siparium often concealed the statue of the deity in times when sacrifice was not performing. In the theatres it was adapted to pretty much the same purpose as in our own; but to develop the scene it was customarily lowered instead of raised, and left during the spectacle on the ground under the anterior part of the proscenium until increased skill enabled them to sink it beneath the stage by means of a prop. Human figures were represented upon theatre curtains whose feet appeared to rest upon the stage when this screen was drawn up. We further learn that the figures were sometimes those of Britons woven in the canvas and raising their arms in the attitude of lifting up a purple curtain so as to be introduced in the same manner as Atlantes, Persae and Caryatides.

#### GENERAL.

**His Majesty the King** is giving sittings to Mr. Luke Fildes, R.A., and to Mr. George Ward for a portrait and statue which they are respectively executing for His Majesty.

**The Council** of the Royal Institute of British Architects have granted the sum of 50*l.* to the Cretan Exploration Fund towards the completion of Mr. Arthur Evans's excavations at Knossos. Since the appeal issued in December the sum of 1,600*l.* has been raised. It was unfortunately necessary to devote 600*l.* of this to the partial extinction of the deficit on last season's work. Consequently only 1,000*l.* is available for the present season. Mr. Evans estimates that at least 2,000*l.* will be required to finish the work at Knossos, so it is still urgently necessary that further contributions should be made to the fund, in order to obviate the risk of leaving this very important work unfinished.

**Mr. Samuel Blow**, builder, London, has left property valued at 20,253*l.* 11*s.* 9*d.*

**The Death** is announced of the Rev. Frederick Spurrell, who was an authority on Sussex archaeology. Among his publications are "Architectural History of Fletching Church," "Roman Remains at Newhaven," "Inventory of the Household Goods of Cornelius Humphrey of Newhaven, 1697," and "Relics of Lewes Priory."

**Mr. Edward Onslow Ford, R.A.**, sculptor, whose estate has been valued at 10,720*l.* gross, has ordered in his will that the President and Council of the Royal Academy should have the option of selection from the plaster casts in his studio, subject to the rights of reproduction of persons interested, and that his children should then each have the choice of one plaster cast, and that the remainder should be offered to such institution or institutions as his son Wolfram may choose.

**M. Charles Toche** is to design the large tapestry to be presented to the Emperor of Russia by the delegates of the Peace Congress at The Hague.

**The Natal Institute of Architects** have held their first general meeting at Durban. The chairman, Mr. A. Fyfe, said the provisional committee had no report to make, but a Draft Bill, proposed to be introduced in Parliament to incorporate the Institute, would be read. This was done and the Bill approved of. Mr. W. E. Robarts was elected president and Mr. A. Fyfe vice-president, Mr. A. M. Ritchie, secretary, and Messrs. Methuen, Wills, Price, Powell, Farrell and Lucas members of the committee.

**The Wiltshire County Council** will shortly hold an inquiry into the obstruction of alleged public rights of way by the erection of barbed wire fences round the Druidical remains at Stonehenge.

**The Vacant Piece** of land in Fleet Street fronting St. Bride's Church has been sold by the Court of Common Council for 10,150*l.*

**An Arts Exhibition** will be held in St. Andrew's Hall, Norwich, from April 8 to 26. From the many promises of support which have been received, it is expected that the Norwich school of painting, Lowestoft china and old silver will be well represented.

**A Meeting** of the Surveyors' Institute will be held on Monday, March 10, when a paper will be read by Mr. C. H. Bedells entitled "Notes on the Insurance of Buildings against Fire."

**The Chairman** of the London County Council will open to-morrow the new southern approach to the Tower Bridge from Old Kent Road to Tooley Street, constructed by the Council at a cost of nearly 400,000*l.*

**The Rev. Dr. Samuel Kinns** has been unable to give his free lectures in the Assyrian and Egyptian galleries of the British Museum in consequence of an attack of nervous debility, which has assumed the form of paralysis agitans.

**An Exhibition** of Cornish pictures will be opened at the Whitechapel Art Gallery on March 26 by Lord Crewe.

**A Library** is to be erected at Dulwich College as a memorial to those old Alleynians who have fallen in the war in South Africa. The estimated cost of the building is 3,000*l.* exclusive of ornamental sculpture, which, it is hoped, will be given by the public. More than half the cost has been already given or promised, and plans have been prepared by Mr. Edwin T. Hall.

**The Paris Academy** of Inscriptions and Belles-Lettres have voted a subvention of 3,000 francs to the Rev. Fath Delattre to enable him to continue the excavations which have already yielded such satisfactory results on the site of ancient Carthage. A sum of 800 francs was also granted to M. Hon for his researches as to the topography of Rome in the time of Aurelian.

**The Fine Art Society** will open on Monday next an exhibition of statuettes by sculptors of to-day. It will comprise 100 works contributed by all the sculptor Academicians, some of the most notable French artists, and by about forty other living British sculptors. It will also include statuettes by the late Lord Leighton, Onslow Ford and Harry Bates.

**The House of Lords** have agreed to the following resolution communicated by the Commons, viz. "That it is expedient that a select committee of this House be appointed to join with a committee of the Lords to consider the standing orders relating to houses occupied by persons of the labouring class, and the clauses usually inserted in private and local Bills and Provisional Order Confirmation Bills in pursuance thereof, and to report whether any amendments should be made in such standing orders and clauses, and especially whether any amendment what provision should be made for better securing the housing of all persons of the labouring class who may be displaced in connection with the undertakings to which the Bill relate, whether displaced under the powers given by the Bill or otherwise."

**The Edinburgh Gladstone Memorial Committee** have chosen a site in St. Andrew Square at the extreme east end of George Street—the Albert Memorial is situated at the west end—for the memorial of the great statesman to be erected in the Scottish capital. The site is at present occupied by the group of Alexander and Bucephalus, which is to be removed from the square, and will be re-erected in all probability in Princes Street Gardens.

**The Private View** of the eighth exhibition of sketches by the members of the London Sketch Club will be held on Saturday, March 8, at the Modern Gallery, 175 Bond Street, W., and the exhibition will be open to the public from March 10 to the 27th, inclusive.

**The Annual General Meeting** of the subscribers and donors to the Architects' Benevolent Society will be held in the rooms of the Royal Institute of British Architects, 9 Conduit Street, Hanover Square, on Wednesday, March 12.

## EDITORIAL NOTICES.

few of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

Authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Respondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

## TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

## COMPETITIONS OPEN.

ALDERSHOT.—March 29.—Competitive plans are invited for proposed public offices, fire-station and town hall for the town. Premiums of £100, £75 and £50 will be awarded for the second and third best plans. Mr. Nelson F. Dennis, M.C.E., surveyor.

AUSTRALIA.—May 1.—Designs are invited from sculptors for a memorial statue of Her late Majesty in marble or bronze. Information can be obtained at the office of the Agent-General for the State of Victoria, 15 Victoria Street, West-mer.

DUNSTABLE.—March 14.—Plans are invited, with estimate of expense, for a six-bed infectious diseases hospital to be erected near Dunstable. A premium of 5*l.* 5*s.* offered for the best selected. Mr. C. Crichton S. Benning, town clerk, Dunstable.

HARROGATE.—May 14.—Competitive designs are invited for a new town hall, the cost of which must not exceed 40,000*l.* Premiums of 150*l.*, 100*l.* and 75*l.* are offered for the three best designs. Mr. F. Bagshaw, borough engineer, Municipal Offices, Harrogate.

IRELAND.—April 21.—Prizes of 20*l.* and 10*l.* respectively will be awarded for the first and second schemes in order of merit for utilising to the best advantage a plot of ground acquired by the Council for the erection of about twenty-five workmen's houses in Coleraine. Mr. William Henry, clerk, Town Hall, Coleraine.

LANGHO.—April 4.—Competitive drawings are invited for buildings to be erected at Langho, near Blackburn, for the accommodation of the epileptics, imbeciles and idiots at present in the workhouses of the Chorlton Union and the township of Manchester. Premiums of 200*l.*, 150*l.* and 100*l.* respectively will be awarded. Lithographed plan of site, and copy of conditions and instructions, may be obtained by a written application only, addressed to the Clerk to the Joint Asylum Committee, Chorlton Union Offices, All Saints, Manchester.

LIVERPOOL.—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

OLDHAM.—April 8.—Competitive drawings are invited for erection of new market hall and shops in Albion Street and Henshaw Street. Premiums will be awarded to the authors of the three selected designs, viz. 50*l.* for the design placed first, 30*l.* for the design placed second, and 20*l.* for the design placed third. Mr. S. A. Pickering, borough surveyor, Oldham.

## CONTRACTS OPEN.

ALDERSHOT.—March 18.—For supply and erection of a pair of large gates, with wicket gate, at the isolation hospital, Cemetery Road. Mr. Nelson F. Denis, surveyor, 126 Victoria Road, Aldershot.

**TRADE NOTES.**

THE new tramp wards, Abbeydore, have been fitted with the latest improved hot-water heating apparatus, by Messrs. John King, Ltd., engineers, Liverpool.

MESSRS. POTTS & SONS are fixing a new Cambridge quarter clock at the parish church, Saltburn-by-Sea. It is to be set going at Easter to commemorate Queen Victoria's long and useful reign. They have also in hand one at Egremont, Cumberland, and one at Huddersfield, West Yorks.

**VARIETIES.**

THE new Congregational church at Sheen Vale, Mortlake, was opened on Tuesday. It takes the place of the old Independent chapel, which was established in 1662, and has cost over 5,000*l*.

THE new schools in connection with the Blackburn Road Congregational church, Bolton, have been opened by Mr. W. H. Lever. They have a frontage of 140 feet and a depth

of 81 feet. The central hall will hold over 1,000 people; two wings contain 29 classrooms, an infants'-room for lecture hall, kitchen, lavatories, &c.

THE memorial statue in marble of Queen Victoria, Leamington, which Mr. Albert Toft is engaged on at his in Chelsea has been inspected by a deputation from the borough, and satisfaction was expressed at the striking likeness. The same sculptor has been commissioned to execute a marble of the King, which is to be unveiled on Monday day in one of the royal boroughs.

A FIRE occurred last week at the Strood Station, London, Chatham and Dover Railway. The building of wood, the flames spread rapidly, and none of the offices of the booking office could be saved. By cutting a platform the fire brigade prevented the conflagration from reaching the signal-box and the inspector's residence, but the room on the down platform was burnt out. The passenger way was not damaged.

A NEW post office has been erected at Dalkeith, opened for the transaction of business on Monday last. The building is an attractive one, and the contractors have their contracts in a very satisfactory way. The frontage comprises 420 superficial feet, and there is a spacious hall of 892 feet at the rear. Telephone and telegraphic apparatus are provided of large dimensions. Rooms are provided for post-mistress and for both male and female clerks, as well as for the postmen. Ample store and battery-rooms are furnished. The cost of the new offices is about 2,000*l*.

THE new Municipal Buildings at Clydebank, N.B., on Dumbarton Road, are now approaching completion. The Town Council are arranging for a formal opening of the buildings were begun over three years ago, and the cornerstone was laid by the Provincial Grand Master, Colonel M.P., in June 1900. The suite comprises large hall and hall, public offices for the burgh officials, police court, police station, library and reading-room. There are also annexes of baths and fire station. Mr. Miller, who was the architect for the Glasgow Exhibition, was the architect of the buildings. The total cost of all the buildings has been variously estimated, but it is believed it will at least 50,000*l*. or 60,000*l*.

A MEETING of the architectural section of the Philosophical Society of Glasgow was held on Monday last. Mr. Ninian McWhannell, vice-president, in the chair.

Sommerville read a paper on "The Habitat and Mode of the Dry Rot Fungus." He commented on the interest in the growth and structure of trees on the part of wood, which was no doubt due to the fact that the bulk of the wood used in this country was imported. A brief description of the structure of a piece of wood, that it was a highly organised vegetable substance, all organic substances, was liable to attack by various fungi. Confining his remarks to wood after it has been placed in a building, he pointed out that one of the diseases was dry rot, a disease of civilisation, and was only found in old dwellings and other buildings of man; it had never been found in the forest. The conditions favourable to the growth of the fungus were moisture and a warm still atmosphere. As to its prevention and cure, the foundations of buildings should be so arranged that no water or moisture be allowed to accumulate near them, and buildings should be so constructed as to keep the foundations and other parts of buildings dry. Wood for fittings should also be dried before being used. Deafening materials should be thoroughly sterilised. The spores and mycelium were shown under the microscope. On the motion of the chairman, a vote of thanks was passed to Mr. Sommerville.

### ELECTRIC NOTES.

Mr. O. SACHS will on Thursday, March 13, lecture to the Society for the Encouragement of the Fine Arts on "Artistic Electric Illuminations," having special reference to the impending Coronation. The lecture will be held at the Royal Society of British Artists, Suffolk Street, at 8 P.M.

Liverpool Town Council have adopted a recommendation to the Local Government Board for sanction to the borrowing by the Council of the sum of 300,000*l.* for purposes connected with the supply of electricity.

A monthly meeting of the Worcester City Council was held on Tuesday, and was presided over by the mayor (Alderman Holland). The electricity committee were warmly welcomed upon the success of the year's work, which had resulted in a profit of 1,380*l.*, and 500*l.* of this having already been applied in the rates in repayment of moneys borrowed

to meet losses, the committee were authorised how best the balance might be utilised.

A LOCAL Government Board inquiry was held at the Town Hall, Newcastle, on Tuesday by Mr. A. A. G. Malet, M.Inst.C.E., respecting an application by the Corporation for sanction to the borrowing of 8,615*l.* for the purposes of electric lighting. It is proposed to place the works on land in the possession of the Corporation adjoining the gasworks. The total cost of the works was 8,615*l.* The annual cost of working, 837*l.*, and interest and sinking fund, 544*l.*, made a total yearly cost of 1,381*l.* The estimated income was 1,500*l.*, leaving an estimated annual profit of 119*l.* There was no opposition to the scheme. At the close of the inquiry the inspector visited the proposed site of the works.

COLONEL A. C. SMITH, R.E., Local Government Board inspector, held an inquiry last week at the Guildhall, Nottingham, into the application of the Corporation for sanction to borrow a sum of 15,000*l.* for the purposes of electric lighting. Mr. F. B. Harris, Mr. Arthur Brown (city engineer), and Mr. H. Talbot (electrical engineer) attended on behalf of the City Council, and it was explained that the loan was required in respect of extensions of the existing system, and of its natural growth during the next twelve months. Of the total sum of 15,000*l.* an amount of 10,000*l.* was put down as an estimate for the underground mains. Mr. Talbot informed the inspector that scarcely a meeting of the responsible committee was held without some application for either power or light being received, and having had the detailed estimates laid before him, the inspector proceeded to view the Talbot Street works, and the new power station on St. Ann's Well Road.

### BUILDING AND BUILDERS.

EYEMOUTH, N.B., parish church is to be renovated and improved at a cost of 750*l.*, from plans prepared by Mr. Fortune, architect, Duns.

THE Hull Wesleyans are about to erect new buildings in place of George Yard church, which has been the headquarters of the Hull Mission, and which is the oldest Methodist place of worship in the city.

THE North-Eastern Railway Company have let the tender for the erection of another high-level bridge across the Tyne,

connecting Newcastle with Gateshead, to the Cleveland Bridge and Engineering Company, Ltd., of Darlington. The bridge will take three years to complete, and the estimated cost of the whole undertaking is 477,000*l.*

At Tuesday's meeting of the Worcester City Council it was decided that the time had come for an extension of the Victoria Institute, and, on the suggestion of Alderman J. Millington, referred it to the finance and library committees jointly to consider and report what extension was necessary, how the money should be raised, and what architect should be employed.

The watch committee of the Smethwick Corporation have had before them several sets of competitive plans for the new police buildings which are to be erected in Halford Street. They have, it is understood, decided to recommend the Town Council to accept those submitted by Messrs. Bailey & McConnel, of Walsall, and the work is to be proceeded with as soon as the necessary arrangements can be made. The estimated cost of the buildings is about 12,000*l.* or 13,000*l.*

The enlargement of St. Oswald's Church, Sowerby (Thirsk), is in progress. The number of inhabitants has increased to 2,050, and the church at present provides for 320 persons only. Plans by Mr. Brierley, architect, of York, have been approved, for the addition of a north aisle to the existing church, which will afford accommodation for about 150 free additional places, and for the building of a new and adequate vestry. The committee have accepted a tender from Messrs. Wilson & Sons, of Leeds, for the building of a new aisle, at a cost of 1,048*l.*

The works committee of Aberdeen Harbour Board have resolved to recommend that the wharf at Commercial Road, from the Fish Market to the Graving Dock, be reconstructed of granite at a probable cost of about 20,000*l.* The minority were in favour of a timber wharf, which would cost about half the price of granite. It is proposed that a further 22,000*l.* should be spent in extending the Fish Market and carrying out other improvements, the total expenditure contemplated being 42,000*l.*

A MEETING of the Horwich, Blackrod and Westhoughton Joint Hospital Board was held on the 1st inst. at the Public Hall, Horwich, to further consider the erection of the proposed new hospital at Horwich. Dr. Sergeant, the medical officer of health for the county, and Dr. Whitaker, of Horwich, were present. Dr. Sergeant explained that the health committee

of the County Council did not wish the board to exceed 16,000*l.*, the amount which had been sanctioned for the building of an infectious diseases hospital, and as the lowest tenders sent in was much in excess of this amount, the committee had instructed the architect to remodel the plan to limit the accommodation of the proposed building to thirty beds, and at the same time to bring down the cost to the limit of that figure. It was decided that as far as possible the material required in the erection of the hospital be obtained from local firms. It was also decided to ask the firms already sent in tenders to again tender under the new specifications and quantities.

The foundation-stone was laid on the 24th ult. for Emmanuel Church, Stoughton, Surrey. The erection of the church marks the final stage of the Stoke Church Extension scheme, which embraced the completion of Christ Church, the erection of St. Saviour's and Emmanuel church, and plans for the latter were prepared by Mr. W. Gillib, F.R.I.B.A., of 25 Bedford Row, though it is not contemplated to carry them out in their entirety at present. The capital one, on the main road, and nearly opposite the building which has served so long as the temporary church. The new church will be in the Gothic style and of a Decorated character. When completed it will contain five bays, with north and south aisles, and a large porch at the west end of each. On the south side the chancel will be a large choir vestry and a clergy vestry. Foundations for a tower are being put in, but this portion of the building will not be proceeded with at present. The stage of the intended tower will eventually be used as an organ chamber, a temporary recess being provided for present use. Internally, the windows will be of red brick dressings, and will be glazed with red-light glass of good quality; and the arcades, columns, bases, and all architectural features will be in Bath stone. The roofs will be open-timbered, stained and varnished, and the flooring under the seats will be of wood blocks, and the passages tiled. The roofs will be covered with green slates. The walls externally will be faced with stone, with Bath stone dressings throughout. The church will be heated with hot-water apparatus, and the ventilation provided by vertical inlet shafts built in the wall under the window opening. The new building will seat about 300 persons. The contractors are Messrs. Webster & Cannon, of Aylesbury. The total cost of erection will be 4,510*l.*

## MEYORS AND AUCTIONEERS' CLERKS.

A general meeting of the members of the Surveyors and Auctioneers' Clerks' Provident Association was held on Tuesday evening at the Auction Mart, Tokenhouse Yard, London, W. Bilby presiding, in the unavoidable absence of Mr. Watney, the president. The Association was formed in 1883 for the purpose of allowances to members in the event of life assurance, medical advice, superannuation and other benefits in distressed circumstances. The Chairman, in moving the adoption of the report and the accounts, congratulated the members upon the fact that the Association had been a prosperous one so far as the Association was concerned. During the past ten years the membership had increased to 107 members. Twenty-three proposals were received for the year, of which twenty were accepted, one deferred, and one was declined. Two memberships had been taken up, and two members had resigned, while three had resigned. The income for last year was 576*l.* 15*s.* 4*d.*, and the expenditure was 14*s.* 11*d.* The latter were considerably larger than in the preceding year of the Association's existence, and were due for by the fact that, through death, the first two years of the life assurance fund had to be met. The standing to the credit of the Association was 9*d.* The Chairman regretted that a great deal of business had been lost among the class to which the Association was devoted, and pointed out that there were 1,900 auctioneers in London, supposing each employed two clerks, there would be 3,800 men, of whom less than 5 per cent. were members. The Chairman reported that increases had taken place in sick allowance, benevolent and superannuation

The Chairman having seconded the Chairman's motion, the meeting terminated.

## THE E.L.B. SYSTEM IN SPAIN.

The Electric Lighting Boards Company have had their first success in Spain, where they have had to take energetic action against Messrs. Oteyza & Urena, of Madrid, who were infringing the Company's patents and had copied the catalogues. In accordance with the policy of the Company the proceedings of the infringers were carefully watched for a few months until substantial damage had been

done, whereupon action was taken, resulting in the infringers having to give in.

It might perhaps be well to remark that in connection with the upholding of the patents in Spain the company enjoys the advice of quite an array of eminent patent authorities, whose experience is brought to bear on such subjects as occasionally arise. Thus among counsel retained by the company are Mr. Fletcher Moulton, K.C., Mr. Blomfield, K.C., Mr. Walter and Mr. Hutchinson, and we have been given to understand that both the first-named gentlemen have given strong opinions in favour of the company's patents.

Further, the company enjoys such expert support as that of Mr. James Swinburne, their consulting engineer, and Mr. John Imray, of Messrs. Abel & Imray, their patent agents. Messrs. Rose-Innes, Son & Crick act as their solicitors here, whilst in Paris their representative is Mr. Kelly (the well-known American attorney, who did so much to destroy Tammany Hall in New York). In America, where it appears the company have no less than three patents, they enjoy the support of Messrs. Dickerson & Brown, of New York; Mr. Norris, of Washington; and Professor Henry Morton, president of the Stevens Institute of Technology.

But, as above mentioned, the company only use these latent forces after very careful and sometimes times-taking investigation. It is an ill wind that blows nobody any good. As the attempted infringement had called the company's particular attention to the prospects of Spanish business, steps were also immediately taken to accord to Messrs. Paz & Sylva, of Paris, a temporary license of the Spanish patents for the Spanish Coronation which takes place on May 17, and this firm, who have been so successful in representing the company in Paris, immediately commenced operations on a large scale in the Spanish capital, one of their first contracts being from the Government fêtes committee.

## CROWN DALE STONE.

### A SILICATE OF LIMESTONE.

A NEW artificial building stone is about to make its appearance which, so far as one can judge from the inspection of samples and the explanations of the reasons of the claims which are advanced for it, should have a very successful future. Crown Dale stone, as the new material is called, is a silicate of lime-

BLACKFRIARS WORKS, MANCHESTER.

stone of excellent appearance, and it is claimed for it that it resists corrosive atmospheres and pressure better than, and frosts as well as Bath and Portland stones. It is the result of numerous and costly experiments, no less than 34,000/ having been expended in the preliminary work by Mr. L. P. Ford (Her late Majesty's first attorney-general in the Transvaal, founder of Fordsburg and Jeppes town (suburbs of Johannesburg), the Johannesburg Waterworks, the Pretoria Electric Lighting Company and numerous other undertakings in the Transvaal, and now chairman of the Lymni (Cyprus) Copper Mining Syndicate, Foreign Lands, director of the Zambesia Railways Company, Shire Highlands Railway (Nyassaland) Company, &c., of Burton Tower, Gresford, North Wales.

The process of manufacture is based upon exact principles, the observance of which, it is claimed, will always insure a perfect product. Pure silica sand and a small proportion of lime only are used, the chemical process to which these ingredients are subjected producing, as we are informed, a perfect amalgamation of great hardness, of any colour and texture which may be desired, easily worked, and of any size from that of ordinary building bricks to blocks weighing some tons. The new stone is, we believe, to be put on the market at a low price (about 1s. per cubic foot), a price which is even less than it looks, as the blocks being made true will obviate the waste in cutting up which unavoidably accompanies the use of natural stones, a loss which is estimated at about 4/ per foot.

### SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on Monday evening, March 3, Mr. Percy Griffith, president, in the chair, a paper was read on "British v. American Patent Law Practice and Engineering Invention," by Mr. Benjamin H. Thwaite, C.E.

The author in his prefatory remarks pointed out that during the nineteenth century and up to the seventies British engineering was supreme, and that the railway, gas, sewage, and other undertakings—the productions of British inventors of the early part of the Victorian era—were almost exclusively designed and constructed by British engineers and with British constructional machinery. At the end of the last century the marvellous progress of the Americans displaced England's industrial supremacy, especially in metallurgical and engineer-

ing developments. Much of the engineering work once controlled by British engineers is now being by American engineers.

The author showed that the progress of American manufacturing and engineering industry was directly encouraged by the States Governments from the time of Washington, encouragement given to American inventors by the States had rewarded Americans with a wave of unequalled success. The author pointed out that the British policy in the inventor was quite different from that of the U. S. and that whereas the British inventor might obtain a patent, which was merely a registration of date and disclosure of the invention, and for which, for a validity of fourteen years, he had to pay no less than 3/ odd, of an unprejudiced examination and investigation by experts. If the patent passed successfully through the inventor had to pay an additional fee of 4/ for secured, without any further payment whatsoever, the patent for a period of seventeen years from the application. The chances that an American patent safely through a law contest were 74 to 100, the chances of the British patent being found valid 58 to 100.

The author then showed that whereas in several States, noted for the inventive characteristics of the capital value *per capita* equalled 682 dols., in the U. S. States, each having a population of low inventive capital value *per capita* only equalled 176 dols. He observed that seven-eighths of the many hundreds of dollars of capital invested in American manufacturing industries were applied to the manufacture of patent products or machinery.

To demonstrate the deadly effect of the yearly the British patent system, the author stated that of the British patents applied for during the last five years 104,000 became void in the fifth or sixth year from the application, and the British Government would lose in fees from those abandoned patents nearly three-a million sterling. The author showed that in ten years the profit surplus earned by the British Patent Department over one million sterling; the American Patent earned a profit of 275,000/.

The author referred to the economic policy of

manufacturers, which explained the reason why modern plant was often replaced by new appliances and increased profits by their improved efficiency. He recommended the adoption of the American patent system, which would stimulate the inventive characteristics of the race. He referred to the 1901 committee appointed by the Government to inquire into the British patent system, and gave their main conclusions and opinions, which were in favour of stringent legislative revision, and he referred to the recent introduction into the House of Commons of a Bill having that object. In his final remarks the author observed that so long as the trade and industry of the world practically to be handicapped the representatives of her industries must be intolerable burdens with impunity, but those burdens must now be removed or England's champions would be reduced to cry "peccavi," and retire discomfited from the

## COLD STORE, SOUTHAMPTON.

The article on the development of Southampton Docks and the port of the *Daily News* describes the new cold store

of mammoth proportions of this warehouse form quite a prominent feature in the landscape of the Southampton Docks. It is 400 feet long, 120 feet broad, and will ultimately be 13 feet from basement to roof. The entire building, of 1,500 ferro-concrete piles, was reared around a skeleton of ferro-concrete uprights and girders, the exterior of which is clad in the same material between wooden panels, and was first equipped with its skeleton of steel bars on either side with a layer of sawdust. The appearance of the cold store before it was that of a huge wooden shed. None would suspect it contained any material other than concrete, but a smart tap, and they answer back with a vibrating sound at a violin string. The building is absolutely fireproof, no matter how severe the conflagration, it is powerless to penetrate the constituent parts of the concrete beams, supports, whereas iron beams and girders expand and warp the walls and floors, and becoming generally a source of destruction as the fire itself.

The building is divided into storeys, the compartments on each, closed by air-tight doors, varying in size according to the nature of the produce for which they are intended. The largest are those for storing whole sides of oxen, and here the ceiling is equipped with "travellers" for running the large pieces of flesh from one end of the building to the other. In aggregate, no less than 2½ million cubic feet of storage are available. On the flat roof are tanks to contain water for refrigerating and machinery purposes, the sides and bottoms of these tanks being formed of ferro-concrete, which, being impermeable, obviates the expense and trouble of erecting iron structures. Standing on the roof, a splendid view over the busy docks and river, thronged with shipping, is obtained. One side of the warehouses fringes a long quay, where the water at the lowest tide does not sink below 30 feet, and hence allows the largest vessels access. Further out dredgers are at work, excavating a new channel 600 feet in width. On another side, beyond the adjoining engine-houses, stretches a large tract of reclaimed land, already pierced by hundreds of ferro-concrete piles and smoothly covered by a concrete floor, on which steam rollers are gambolling. This is the site of the lairages, to accommodate 1,000 head of cattle, the abattoirs, the cooling-rooms and the chilling-sheds.

The engine and boiler-houses for the refrigerating, lighting and hoisting machinery are also built of ferro-concrete. The arrangement of the boiler-house demonstrates the strain which the material can bear, for the first floor, where the coal is stored, is subject to a pressure of one ton per square foot, and the floor above that takes 3 feet of water.

## SCOTTISH MASTER PAINTERS.

THE annual meeting of the Association of Master Painters in Scotland was held on the 28th ult. in the Windsor Hotel, Glasgow. Mr. Alexander Latto, Aberdeen, the president, occupied the chair, and there was an attendance of about 100, including representatives from the English and Irish Associations. Mr. W. B. Crawford, the secretary, submitted the annual report of the committee. It stated that similar national associations now existed in England, Ireland and Wales. Many Scottish members had attended their conventions and had derived benefit from them. Such national associations

did much to create close and friendly relations between the members, and they also took care of the education of the young people who meant to enter the craft. The state of trade during the year had been satisfactory, and in Glasgow the International Exhibition gave a big impetus to the trade. No strike of importance occurred during the year, and the arrangements of last year would be continued. With the Association there were eleven local associations affiliated, and a new local body in Forfar proposed to affiliate itself. The total membership was about 225. The report was adopted. The President, in his address, remarked that these local associations benefited the men, masters and public. He thought, however, that as an Association they should extend their operations. Disputes should be reported to the general body, which should settle them without those strikes which were always arising. He concluded by proposing that Mr. John Scott, Glasgow, be elected president for the ensuing year. The new president afterwards took the chair. Mr. W. B. Crawford, Glasgow, was re-elected secretary and treasurer. On the motion of Mr. Laidlaw, Hawick, seconded by Mr. Lindsay, Galashiels, it was remitted to the Council to appoint a special committee to consider as to the best means of inducing master painters outside of the Association to become members, and also to induce members of the Association to support the Apprentices' Competition by getting all their apprentices to enter for the competition, and so raise the status of the trade. The report of the adjudicators on the Apprentice Competition showed that thirteen prizes went to Glasgow, a similar number to the Border counties, four to Aberdeen and four to Dundee. In the evening the annual dinner of the Association was held.

#### REGISTRATION OF PLUMBERS.

THE annual meeting of the members of the North of England district of the National Registration of Plumbers was held in the Lecture Theatre at Tullie House on the 28th ult. Mr. Crowder presided, and when the ordinary business had been transacted a lecture on the application of scientific principles to plumbers' work and sanitary arrangements was given by Mr. Joseph Radcliffe, the instructor at the plumbers' classes in Manchester Technical College. During the last sixty years, he said, the work of the plumber had undergone very great changes. The old plumber was easy-going, well paid and respected by those who employed him, he had many friends

and was looked up to by his neighbour. To-day taking into consideration the importance of his work, worked, underpaid and, speaking generally, did not have the confidence of the public except as regarded his work in such a manner that it would be sure to attract attention again in the near future. The reason for this was that the plumber of the former days and the plumber of to-day had changed and the plumber had to the same extent as the work. There were now a few of the fittings of the modern residence, hot and cold water supplies, lavatories, sinks, baths, and vent pipes, &c., and the plumber had time to make pipes and other appliances. To-day these things were for the plumber by improved methods, but the labourers had been extended, and if he would only get out of the old groove and bring himself into line, he would be much improved and the public would be much benefited. The plumber was directed by almost everybody as to what he should do his work; but that was not right. The plumber should be the man to say how plumbers' work should be done. He questioned the work of the doctor, lawyer, architect, and engineer, for the simple reason that they had mastered the principles of their trade, and the plumber, who might be called singly to any house, ought thoroughly to know his trade. Practical work was of much greater value if based on principles, and to understand these principles the plumber should have had a good elementary education, and some knowledge of chemistry, mechanics and physics. Proceeding to the effects of the atmosphere, water and earth on pipes and other appliances, he said that water from a surface with peat would be slightly acid through the decomposition of the peat. If this water should be washed by the rain in the reservoirs where the water was stored for use it would have a distinct action on all the lead pipes through which it passed, and either the water would have to be treated so as to neutralise the acid or pipes would have to be used in which the acid could not come into direct contact with the lead. He gave one among the many examples which he gave of material which the plumber ought to know. The lecturer showed a series of interesting slides showing examples of ancient and modern plumbers' work, and concluded by showing views of the particular regarding the successful classes in Manchester. Mr. Williams, Newcastle, secretary to the Council, expressed the hope that the lecturer would allow his instructions to be printed, and votes of thanks concluded the proceedings.

# The Architect.

## THE WEEK.

factory to find the President of the Institution of Engineers advising students to give due attention to architecture. Mr. HAWKESLEY last week was at a dinner of engineering students in Leeds. In his speech he said there was no reason why they should continue to uglify the world. Those, he stated, the most perfect which, in addition to special qualities required in them, presented a pleasing appearance. What a different aspect would be given to England if similar advice had been given and acted on in Great George Street by STEPHENSON, HAWKESLEY, BATEMAN, FOWLER, and the other great engineers of planned railways, waterworks and gasworks. If the stations alone could have acquired an architectural character a great improvement would have followed. It is never too late to mend. England may not again witness the repetitions of such colossal structures as those which are to be seen in the country, but in colonies and foreign countries no less vast may arise, and for the sake of the reputation it would be an advantage if they presented a more satisfactory appearance.

Chief Justice and other judges of the Supreme Court of Sydney have united in a communication to the Government Works respecting the need for the construction of new Courts. No surprise is excited in any class, as it has long been known that the buildings used as Courts are altogether inadequate for the administration of justice in so important a colony. There is no doubt that the existing Courts are dangerous to all who frequent them, and in some cases it has been necessary to remove the permanent fixtures to safer premises. The existing Courts are not adapted, but they are detached, and consultations with the judges cause delay. A suitable site is now being selected, and the judges are of opinion that all the Courts should be erected upon it under one roof. The great objection is the expense, but it is understood that in the present year the subject will be dealt with in the House of Representatives. Sydney has lately attained increased importance as a metropolis, and it will have to uphold its position in Australia by buildings which will be worthy of its purposes.

of fixtures is generally looked upon as being the right of tenants. On the other hand, costly fixtures are regarded by landlords as injurious to their property. An example was tried before Mr. Justice FARWELL at Liverpool. The premises in question were held on a lease of Church Street, Liverpool. Among the covenants in the lease the lessee would not make or suffer to be made any alteration unless with the previous consent of the lessors. The lease was afterwards assigned to a tenant, and without receiving permission he put up a clock in diameter in an iron frame supported by brackets which were let into the front wall. The lessors sought a mandatory injunction for its removal on the ground that it was an alteration. On the part of the defendant it was stated that the clock was a fixture used as an advertisement, and that it was not an alteration. Mr. Justice FARWELL, however, held that the clock was an alteration. If trade fixtures were to be set up, his lordship said that every stone in the wall could be made to support some object or ornament, and that the plaintiffs suffered no loss, but it would be necessary to restore the wall to its original condition. The injunction was therefore granted. What would be the result under ordinary circumstances, the judge did not say; but in this case there was a definite finding that no alteration was to be made without the consent of the lessors. When the parties had formed a bargain of that kind there is no necessity to discuss principles. To the people it will appear an advantage for lessors to allow alterations made without cost to them, for if

the premises had gained a reputation for clocks and watches the big clock would be enduring evidence that the business was carried on, although the premises had fallen into the hands of a different lessee.

A STORY is told by M. ALFRED PELLIER about the beginning of the life of FALGUIÈRE, the sculptor, in Paris, which is not surpassed by anything related in the "Vie de Bohème" of MURGER. FALGUIÈRE was a native of Toulouse, and he displayed so much talent that he was allotted one of those bourses which have helped to create many able French artists. It was expected that by means of it and occasional employment in Paris he would be able to attend the Ecole des Beaux-Arts. But to the young and joyous FALGUIÈRE the Tourlousian cafés of the Quartier Latin were more attractive. He did not trouble himself to ascertain whereabouts the school was to be found. There are, however, too many regulations in France to allow recipients of public money to fail in carrying out the conditions of the bond. He was obliged to make inquiries, and then he discovered to his annoyance that his allowance was about to be stopped because he had not forwarded to Toulouse any evidence of his progress. It was incumbent to send a copy after the antique, but that would require at least three weeks' toil. FALGUIÈRE decided on forwarding a substitute. He bought one of those plaster casts of a reduction of the Venus of Milo, which were then to be obtained for a few sous. He soaked it in water, filled the hollow interior with plaster, coated the exterior with "barbotine," and then made a number of scratches on the surface as if he had worked on it in a regular way. It was lodged at the school, and a few days afterwards he received not only his pension, but congratulations on his promising opening.

ONE of the most popular of books at one time was the biography of HIPPOLYTE FLANDRIN. It may be doubted whether so much attention was before or since given in this country to the life of a French artist. He revived the class of paintings which were adapted for churches. His style can be judged from the two large engravings we published of his paintings in the church of Saint Germain des Prés; he also produced the great frieze which is seen in the church of St. Vincent de Paul. He died in 1864. In the biography there is much about his brother JEAN PAUL FLANDRIN, who, like HIPPOLYTE, was a favourite pupil of INGRES. He co-operated in the production of the church decorations. He was more versatile than his older brother. The love of nature became supreme with him, and he devoted himself entirely to landscape-painting. His range was wide, and extended from the environs of Paris to the wildest forests. After a most useful life, he died last week in his ninety-first year, leaving only few survivors of the combatants who took part in the great battle of Classicism *v.* Romanticism.

WHEN it was lately announced that the civic authorities of Chicago had declined to sanction plans for some very high buildings, it was assumed that a reaction against the principle had commenced. If a change had been resolved upon it was never enforced. The authorities have been compelled to sanction schemes for still higher buildings than formerly, and all objections on account of amenity have had to be set aside. Chicago commenced the practice of erecting piles of offices, and it is not likely they will ever be abandoned in that city. They were not dictated by whim or fashion, but by stern necessity, and when an architectural form is so introduced it is not easily set aside. Men of business in America, where minutes are precious, find a convenience in having all the offices in which affairs are transacted by them under the same roof, and it would be difficult to make them return to buildings of a few storeys. English business is conducted in a different way, and the need for twenty or thirty storeys of offices (they propose fifty storeys in St. Louis), is therefore less apparent to us. At the same time, it would not be hard to have a change, especially in some parts of London.

## GREEK ORNAMENT.

THE architectural ornament of the Greeks is easily exhausted. They used the honeysuckle, the acanthus, the bay-leaf, what the French call *feuilles d'eau*, the palmette, and one or two more of uncertain character. By them the whole vegetation of Greece was represented. It is possible that in the hangings which adorned the temples there may have been other forms employed, and on the robes of the statues of the deities there was probably embroidery in which flowers and leaves were imitated. But, unless we are mistaken, the varieties were restricted. When we compare the ornament of Greek temples with that of Mediæval churches we must draw the conclusion either that Greece was not a fertile country or that the artists were indifferent to the forms which sprang from its soil.

There are grounds for both beliefs. Greece was essentially a rocky land. In the neighbourhood of Athens there is but little to be seen which can recall a pastoral or agricultural district. If it were not for the olive trees there was not much on which the eye of a Greek could have rested with delight in the time of the great artists. The gratification of PHÆDRUS at being able to sit on grass under a plane tree suggests the privations of an excursion outside the walls of Athens. Trees rather than flowers were admired. They were even thought to be worthy of employment in a work of art. It is maintained that one of the statues of ATHENÉ bore an olive-branch in the hand, and there was in Rhamnus a statue of NEMESIS by PHIDIAS which carried a branch of an apple-tree in one hand and a vase with figures of Ethiopians in the other. It was not to be supposed that the divinities would derive much interest from the gathering of flowers, or would care much for their representation.

We must not take it for granted that the Greeks, although they possessed many qualities in common with moderns, found that gladness in the presence of nature which is now met with everywhere. The poets contrived to produce great effects without having recourse to the fields for illustrations. One reason no doubt was that owing to the general unproductiveness of the soil the earth could only be looked upon as an agent which was not always favourable to the necessities of those who belonged to it. A Greek was satisfied with plain food and with a small quantity of it. But it was doled out to him by "a stony-hearted stepmother" in a niggardly manner.

We should also remember that the cultivation of the land was in most places imposed on slaves. On that account the ground would not be prized by free citizens who retained the practice of arts and trades in the cities. The Greek was above all a townsman, and he loathed whatever compelled him to withdraw from the public places, which were dearer to him than the most beautiful landscapes. A visit to the country was therefore a task, and if he were obliged to go to his farm he was not likely to bring back bunches of flowers as a memorial of the journey. All this indifference to life-creating earth will seem to us to be unworthy, and evidence of a defective constitution or a prosaic instruction. It was, however, a prevalent shortcoming, and it was expressed beyond all doubt by the trivial quantity of architectural ornament that could be claimed to be inspired by the fields.

It is true that when a poet happened to live in a fertile country such as Sicily or Libya he did not fail to celebrate the fruitfulness of the soil. But the epithets are generally bestowed in a condescending manner, as if Mother Nature had done no more than her duty in obeying the desires of her lord and master, Man. It cannot be said, however, that there was a change in the character of the ornamentation, which everywhere in Greece seemed to be afraid to manifest an indebtedness to the fields.

We have mentioned the possibility of flowers forming part of the ornamentation of stuffs which were used for the adornment of temples. If so, they must have been considered as of minor importance. In the accounts which have come down to us of ancient tapestries we read only of mythical and historical figures, or of arabesques in which animals were elements. The sail of the ship of ATHENÉ, which, like those on the sands at Southport, was mounted on wheels, was covered with representations of the deeds of the goddess, and especially her contest for supremacy in

Athens. In our time it would show a fine all-based on olive leaves. It is also very rarely found on a Greek coin. In the earliest painting judging from modern practice, we might suppose would begin with attempting the representation of figures derived from them, ambitious at first, common, for the subjects described are often of difficult character, which would tax the abilities in an advanced age.

The canons of art generally adopted were in accordance with the saying which was an early philosopher, "Man is the measure of all things." The number of figure-pieces which made up of *ACHILLES*, as recorded by HOMER, suggests simple subjects in an early age were not. The only mention of flowers in that memorable form of a garland. The triple rims are well known. In the vase paintings we find figures introduced in the borders, and although ornamental borders are employed, do not denote any extensive knowledge of botany to the painters. The ornamentist was not confined by any limitation which was imposed on the sculptor in the temple, but considering how vast was the scope of the vases presented the restrictions are remarkable.

We presume that unless vegetation was necessary for the sake of contrast a Greek artist regarded it as a waste of time and opportunity to employ any forms but those of man and noble animals. The proper study of man, it has been said, and it would be endorsed by a Greek sculptor. We are afraid he looked upon temples as gaining importance by means of flowers, or as means for the display of it. Carved ornament has since been devised which seems more appropriate as an aid to architecture than figures as Greek sculptors have produced. There are no curves to be found in plants which have surpassed in the human figure, and we can see how the latter can be adapted to fill triangular spaces. With ornament, in the ordinary sense of the word, there must be repetition, and the Greeks could not avoid repetitions which seemed to have neither beginning nor end, for a border of palmettes could be repeated continuously. With figure subjects there was consistency. The contests with the centaurs, which occupied the metopes in the Parthenon, are independent of each other, and we can make every one of them the subject of a drama or a tragedy. If the spaces had been filled with ornament which was a copy of natural forms, instead of conventionalising of them, they would have long possessed much interest. On that account attention has been made to convince people that Eastern art, especially has a symbolic meaning, for if considered as an arrangement of graceful lines the attraction of any pattern is fleeting.

With the Greeks there is no doubt that the human figure was more expressive than it is with us. It was urged that many of the myths are only allegories for natural phenomena, and the gods or goddesses who are characters in the legends were embodiments of operations which affected the human race. The elements which occur in the atmosphere, the motions of the waves, rain, lightning, light and darkness were in the opinion of some investigators expressed by the figures of mythology. A figure of a god or goddess was more likely to recall to the Greeks much else besides the human form. The Greek himself as struggling with a centaur or controlling a prodigy was also more than the ordinary man. He was a hero who was capable to become a hero, and as such he was called upon to have a contest with a monster. Whenever his country was concerned the Greek was reverential, and even ZEUS himself was treated with respect. The stronger race of Titans were ready to dispute his power.

When such ideas prevailed, the leaves of plants were not the means which were best adapted to express the Athenian spirit. The Greeks, therefore, employed simple forms only in positions and for purposes where the human figure could not be easily substituted. There was no room for all things, and it is possible to have human representations on too small a scale, as well as on too large a scale. The Greeks, therefore, avoided the

to undervalue their own nature by miniature or paintings of it in their temples. But they took suggest that the substituted ornament was of inferior e, and they adopted few models, as if to emphasise instance.

## STEEL COLUMNS.\*

reviewed Professor FIDLER's book at some length when it first appeared. The advantage of it con combination of theory and practice. Investi principles have generally reference to executed here is in consequence, if we might so express much of the air of Westminster introduced into e classroom. The volume has now reached edition. The author has given attention to ges as are demanded by the increased loading of consequence of the additional weight and power er types of locomotives. But as regards the question of the working strength of iron and e is little to correct. According to the Professor, ot yet been found possible to frame any rules t meet with general acceptance, nor to define connection between 'fatigue' and the effect of ued vibrations. If we proceed upon the es that there is no connection, we are logically ules that would condemn as utterly unsafe a large existing bridges; and as the bridges remain safe n they bear a standing witness against the adoption rules." It is not necessary to again notice the isions of the book, and we shall therefore confine or the present to the author's investigation of the strength of columns.

stone columns were first used their proportions tained by appearance rather than by construc sity. The old builders were likely to have known ases in which stone succumbed under the load n it. It would have been quite safe in many ave substituted one of the lighter orders for a sive one. The Greeks, like Mr. Pocock, believed ie of "a little stronger than strong enough," and that their columns should manifest that they u to the duty imposed on them. But it was ept which inspired the proportion recorded by u when he said that the Roman Doric column even times the diameter, the Ionic  $8\frac{1}{2}$  times and nian  $9\frac{1}{2}$  times. These ratios it is needless to say ways followed.

n column of iron or steel or the strut of a large r is designed nobody thinks of the practice of ck and Romans, for appearance is of no account alulations. The whole question resolves itself e flexure or buckling. We have, therefore, to t strength of the material, its elasticity and its urer a weight to depart from the original verti axis. If compression alone had to be regarded ncloubt that cast-iron would be the most eligible eise in columns. When between fifty and sixty e subject of girder construction began to receive , great many patents were taken out for "com ducers" in which cast-iron was employed equally ight-iron. But it was found by experience that es which were to be met did not always act simply reive or tensile, and when cast-iron had to resist n failed. Attempts were also made to combine n account of its elasticity with cast and wrought rd to serve as a means to simplify the strains, arrangement was not more successful. The most e of the combination of cast and wrought-iron Wren girder, which at Newark Dyke was utilised o feet in length. In the top member twenty- t-in pipes were used. There is no doubt that if es which are set into action by the loads on a bridge wa act singly and simply the arrangement would fic. The mere compression in any structure, how-

ever, becomes almost what the French call *une quantité négligeable*. As Professor FIDLER says:—

The most friable material, or even loose sand or water, if it is prevented from escaping laterally, will carry any load that can be placed upon it. Indeed, it is probable that there can be no such thing as failure produced by a direct compressive force pure and simple, because it is impossible to squeeze two ultimate particles into one, and the only way in which the idea of failure can be conceived in the case of a cube or slab is by the lateral motion of the particles sliding past each other and finding some lateral exit by the shearing of friable and crystalline materials, or by the flow of such plastic materials as wrought-iron and steel.

It would therefore seem that the more rational method of indicating the work performed by a column would be by means of bands or ornamentation about the middle of the shaft, as was attempted by some Renaissance architects, rather than by cable fluting in the lower part. The tendency of a column under its load is to become deflected or bowed, and the bands suggested where strength was required. It might be supposed that the entasis of ancient columns was a recognition of the liability to deflection, if it were not that we know it was simply introduced as an optical refinement.

The circumstances under which wrought-iron and steel columns are made do not allow of any concern about the appearance of such supports. Whatever may be the length, it bears some analogy to a cane or stick that is not expected to bend under a pressure that is not extraordinary. We might presume that in the case of a stick or cane any bending would be followed by a resumption of verticality as soon as the load was removed. But in structures where columns are used it cannot be imagined that the load will be diminished, and the stiffness must therefore be sufficient to prevent the deflection from becoming perceptible. According to Professor FIDLER, the resilient or elastic force is proportional to the modulus of elasticity, but is independent of the ultimate strain of the material:—

A long (ideal) column of the strongest steel would be little or no stronger than a similar column of wrought-iron, because the modulus of elasticity is nearly the same in both materials, and however great the ultimate resistance of the steel may be, the crushing stress will inevitably be reached at some period of the increasing bending strain if only the load is sufficient to overcome the resilient force of the bow, and to set up the ever-increasing deflection. The only difference that may be theoretically expected is that the steel column would take a greater ultimate deflection than the wrought-iron column before it became actually crushed or crippled on the concave side, but the breaking weight would be nearly the same for both. Indeed, when the ever-increasing deflection has once been set up, the column may be considered as having failed for all practical purposes, no matter what may afterwards happen to it during the course of that buckling process.

Steel can be rolled so cheaply, it is superseding not only cast-iron but wrought-iron as a material for columns. In practice, columns are built up from the sections which are available in the market. With angle irons, plates and channel irons a great many varieties of columns can be produced. The Americans have, however, a larger number of sections to select from. At one time they used to make an octagonal column by the union of four special channels. The Phoenix column, composed of four or eight rolled segments, with projections to allow of rivetting, is a favourite with the American skeleton builders, partly, no doubt, owing to its roundness. Professor FIDLER says it is very strong and well supported. On account either of the uniformly good quality of the metal, or the admirable form of the section, the strength exceeds that obtained by RANKINE's formula.

Professor BURR, the American engineer, who has given much attention to the subject, has come to the following conclusions from his numerous experiments about the arrangements of the parts of steel columns:—"The material should be disposed as far as possible from the neutral axis of the cross-section; there should be no initial internal stress; the individual portions of the column should be mutually supporting; the individual portions of the column should be so firmly secured to each other that no relative motion can take place, in order that the column may fail as a whole."

*Practical Treatise on Bridge Construction*, being a Text e sign and Construction of Bridges in Iron and Steel, e of students, Draughtsmen and Engineers. By T. Claxton n C.E., Professor of Engineering, University College, h numerous illustrations and lithographic plates. tion enlarged and revised. (London: Charles Griffin &

The science which is required in designing girders and beams and the care which must be taken in their manufacture and adaptation should be enough to overcome the prejudice against their use in buildings. Whatever may be thought of the columns and beams, they can be no more kept out of buildings than the Atlantic was in England through Mrs. PARTINGTON's heroic efforts. The desire which is so often expressed for a new style is really an admission that the old forms of building in which stone, timber and brick were the materials have lost their interest, and therefore men are craving for different arrangements which will allow more scope for inventiveness. With the aid of steel and iron it may be possible to attempt remarkable efforts in building. In that case, however, much else besides Vitruvian rules for columns and traditional dimensions of parts will be required. Science must be utilised, and a book like Professor FIDLER's will have to become as familiar to the architect as to the civil engineer.

Mr. F. O. Taylor read a paper on "The Manor of Kenninghall, and its connection with the Chief Butlership of England." He said that there were three claimants for the position of chief butler—(1) The Duke of Norfolk, who claimed as Earl of Arundel; (2) Lord Mowbray and Stourton, who claimed as the only known heir in the senior line of William d'Albini, the original grantee; and (3) Frederick Oddin Taylor, who claimed as Lord of the Manor of Kenninghall, which his late father, John Oddin Taylor, purchased some thirty years ago of the trustees of the Duke of Norfolk's settled estates. The duty of the chief butler was to serve the king with wine at the coronation banquet, and to provide the wine for all others present at the banquet. The fees in the earlier days were the best gold cup and cover, with all the vessels and wine remaining under the bar and all the pots and cups, except those of gold and silver, which should be in the wine cellar after dinner, but these fees were considerably cut down in later reigns, and on the last occasion when the banquet was held (at the coronation of George IV.) the Duke of Norfolk, who filled the office of chief butler as Earl of Arundel and Lord of the Manor of Kenninghall, received a gold basin and ewer as his fee. The chief butlership

was held by grand serjeanty, and he claimed that of Kenninghall was held by the grand serjeanty of to the kings of England on the day of their coronation manor of Kenninghall, together with the lordships of Bokenham (Buckenham) and Wymondham, Snettisham, were granted by William I. to William who came over from Normandy with him, to be her serjeanty by the service of being chief butler to the king of England on the days of their coronation. The d'Albini married Maud, the daughter of Roger of Norfolk, and both he and his wife were buried at the high altar of the abbey church at Wymondham, where he had founded in the reign of Henry I. His son was Henry II. Earl of Arundel. The office of chief butler was exercised by members of the Albini family for many generations; it was recorded that at the coronation of the queen, the Earl of Warrenne (father-in-law of Hugh d'Albini) as butler in the place of Hugh d'Albini, Earl of Arundel, who was at that time under sentence of excommunication by the Archbishop of Canterbury, "because he was Archbishop was hunting in the said Hugh's lands in Sussex the said Hugh seized his hounds, and the Archbishop claims it as his right to hunt in any land in England whenever he pleases." The Earls of Arundel did not undisputed possession even at this time, for the office was exercised in respect of the ownership of the manor of Kenninghall by Roger de Monte Alto in the reign of Edward I., and by Robert de Monte Alto at the coronation of Edward II. and Edward III. As a result of inquiries by the Barons of Exchequer, concerning which the king said:—"A decree was made that the office of chief butler should be thenceforth performed by the lords of the manors of Kenninghall, Bokenham and Wymondham, and their deputies in turns, and Robert de Monte Alto served in the office at the coronation of Edward II. accordingly." The Duke of Norfolk alleged that this statement was wholly untrue, but if so it was rather a curious claim that claims had been put in by the lords of Bokenham at many coronations, the last of which was that of George IV., when the Hon. and Rev. Mr. John Lubbock, brother of the Earl of Carnarvon, claimed the office, and it was the turn of the manor of Buckenham, and not of the manor of Kenninghall, to the decree above mentioned, and to various other manors in support of his claim. Blomefield, being for so long a time of Fersfield, the adjoining parish to Kenninghall, and having access to documents not now forthcoming, is likely to have been mistaken, corroborated as he is by the claims made in respect of the manors of Buckenham and Kenninghall from time to time. In the year of the coronation of Edward III., namely, 1327, the manor of Kenninghall was settled by Robert de Monte Alto on his wife and his heirs male, with remainder in default of issue to Queen Isabella, mother of the king, for life, with reversion to John de Eltham, the king's brother, and the heirs of John de Eltham, with an ultimate remainder to King Edward III. Robert de Monte Alto died without issue in 1329, and John de Eltham died a bachelor in 1336, when King Edward III. was entitled to the reversion expectant on his mother's death, and it was no doubt by virtue of his claim that the queen dowager occupied the castle at Kenninghall in which she lived many years, and was for some time a prisoner by her son, the king's order. The Duke of Norfolk alleged that the tenure of the manor of Kenninghall by grand serjeanty, if it existed at all, became extinct on the union of the reversion of the manor with the Crown, and could not be so, for it would be noted that the king's claim through any escheat or forfeiture, but under the limitation of the settlement. The king, too, never possessed the manor, as he granted the reversion to William de Montacute, first Earl of Salisbury, in the lifetime of the queen dowager, who did not die till 1358. The manor was in the hands of the Montacute family till 1377, when it was granted by William, second Earl of Salisbury, on the marriage of his son, Sir William de Montacute, Kt., with Elizabeth, daughter of Richard Fitzalan, sixth Earl of Arundel, in fee, with remainder to William, Earl of Salisbury, the fee. In the records of the Court of Claims at the coronation of Richard II. in 1377 (of which a full record exists) the petition of Richard, Earl of Arundel, claiming to serve as chief butler was fully set out, and his claim was disputed by Edmund de Staplegat (Geoffrey Chaucer, the poet), but it was allowed that he should serve at the coronation of the king, and that the rights of all others." The manor of Kenninghall was held for fifty years by Elizabeth de Montacute, who was married to the Duke of Norfolk, and during that time, according to the records, the chief butlership was served by either Fitzalan or Thomas Fitzalan, Earls of Arundel. It is important to notice that these earls were related to the Duke of Norfolk, and, therefore, would act as deputy for her, inasmuch as she could not act in person. At the coronation of

the manor had apparently reverted to the possession of the Montacute family, but at the coronation of Edward IV. it was in the possession of Joan, wife of William Alan, Earl of Arundel, a direct descendant of the Montagues, so that the earldom and manor were practically united in husband and wife, and if William Fitzalan served the office at coronation it was doubtless "jure uxoris." At the coronations of Richard III., Henry VII., and the Queen of Henry VIII., the manor was held in dower by another lady, Elizabeth, daughter of John, the first Earl of Shrewsbury, and widow of John Mowbray, Duke of Norfolk. At the coronation of Henry VIII. (1509) and Anne Boleyn (1533) Dukes of Norfolk, possessing the office of Earl Marshal, were owners of the manor, it might be that these noblemen put in no claim to the butlership, but were content with officiating as Earl Marshal. In 1546, the year of the coronation of Edward VI., Thomas Howard, Duke of Norfolk, was attainted, and the manor went to the Crown, and Henry, Earl of Arundel, held the office of chief butler. In 1548 Edward VI. gave the manor of Kenninghall to his sister, afterwards Queen Mary, who resided at Kenninghall occasionally in the magnificent palace erected about 1525 by the third Duke of Norfolk. She was at Kenninghall at the time of the death of her brother, Edward VI., and wrote a letter asserting her title to the Crown. The palace was pulled down about a hundred years later, and no trace of it remained. In 1590 the earldom of Arundel and the manor of Kenninghall became reunited in the same person, namely, Philip Howard, Earl of Arundel and Duke of Norfolk, and remained so united until Mr. John Oddin purchased the manor from the present duke in 1872. The coronation of Charles II. was the first occasion of a banquet since the reunion of the earldom and the manor, and then it was claimed that the office of chief butler "was appendant to the Earldom of Arundel, and the rather that the said Henry Earl of Arundel held in his right in his demesne as of fees the manor of Kenninghall with the appurtenances in the county of Norfolk, and is, and antiently of long time heretofore was held in his right in his demesne as of fees the principal and chief butler of England on the days of the coronation of the kings of England." The words "and the rather" showed that it was asserted that the claim was mainly and chiefly based on the ownership of the manor of Kenninghall, and claims in exactly the same form were made at subsequent coronations. In the light of these official records, it seemed to him that the office of Norfolk was precluded from alleging that the grand butlership was extinct, or that the manor of Kenninghall had nothing to do with the chief butlership. He sincerely believed the question had been gone into by the Court of Claims the day before the manor of Kenninghall would have been established. In conclusion, he trusted he had shown that his claim to the chief butlership was not a fanciful or imaginary one, but that it rested on a solid foundation. The Court on December 4, without expressing any opinion in regard to the merits of the three claims, directed that they should be recorded for the consideration of right, and they would accordingly be noted in the coronation roll, so that if the banquet should be hereafter given the three claimants would not be prejudiced by the exercise of the office at the approaching coronation of their majesties King Edward VII. and Queen Alexandra.

Mr. L. G. Bolingbroke then read a brief paper on "Old-World Modes of Light and Lighting," illustrated by numerous lantern slides. The first was the flint and tinder, and he said that flint and iron pyrites had been found lying beside the remains of Neolithic man. Flint, steel and tinder were kept together in a tinder-box, which was generally made of tin, and consisted of three pieces, the box, the damper and the lid, the tinder which was used as a socket for holding a rush candle. A spark from the flint had fallen on the tinder a bright flame was lighted from the smouldering linen. At the beginning of the nineteenth century improved forms of tinders were invented. One exhibited was pistol shaped, and a spark was obtained by pulling the trigger. About 1830 tinders began to be supplemented by the match, although a writer asserted that the tinder-boxes would always retain their popularity on account of their cheapness. In the past of the country the use of lamps died out after the agricultural occupation, but lamps similar to those used by the Romans were in use in Scotland quite recently. An old Dutch lamp was of similar principle. In the eastern counties of England lamps were the most universal. A rush fair was formerly held annually in Norwich. About 1835 it was held at the Swan inn, and began on August 2. It died out about 1880. The rushes used were those for candlemaking. There were three kinds; one for tapers and the other for candles. Specimens of both were shown to the audience, and also two of the moulds for candles made in the farmhouses. These moulds contained a cotton wick. Among the accessories were the tapers, specially made to hang on the walls. The rushes are inserted in an iron clip, which was fixed in a block of wood. Not infrequently a combined article was made,

having a clip for the taper and a socket for the rush candle. The ordinary rush candlestick was similar to those now in use, but smaller. Snuffers were to be found of all sorts and sizes, and the essayist stated that Mr. E. Bidwell had 288 of various forms. There were also little dampers—something like scissors—to extinguish the light altogether. Instead of night lights, a candle was enclosed in a perforated iron cage. Those used in nurseries were so enclosed as to render it impossible for children to get at them. He also exhibited a pair of smoker's tongs, which hung at the side of the fireplace. With these the smoker secured a live coal to light his pipe.

The next contribution was on "Norman Fonts in Norfolk," and was delivered by Mr. E. M. Beloe, jun. It was illustrated by a splendid series of lantern slides from photographs taken by Mr. Beloe. These slides indicated to perfection the details—oftentimes very grotesque—of those ancient specimens of the stonemason's art. The first one shown was that at Burnham Deepdale, which is remarkable for the fact that round the sides are twelve figures representing each month of the year, and all engaged in agricultural pursuits. January was represented by a man drinking from a horn; February by a man seated in a chair with his feet on the hearthstone; March by a man digging with a very primitive spade; April by a man with a bill-hook; May by a female figure with a banner and apparently a tree; June by a man either tying a faggot or pruning a tree; July by a man mowing; August by a person tying up a sheaf; September by a man threshing with a flail; October by a man either grinding with quern-stones, or, as was more probable, pouring wine from a bladder through a kind of funnel into a vessel; November by a man killing a pig; and December by four figures eating at a table. On the font at Fincham are the Adoration of the Magi, the Nativity, the Temptation, and the rite of Baptism. The Temptation in the Garden of Eden is very grotesquely represented by the Norman masons. The Norman fonts at Great Snoring and Old Hunstanton were plain, while that at Bagthorpe had ornamentation on one side only. The similarity of the ornamentation on many of these fonts—which the lecturer thought to be derived through Celtic and Byzantine sources from Persia—was fully explained by means of excellent detail photographs. This ornamentation existed on three sides of the font at Sculthorpe, while on the fourth side was the Adoration of the Magi. The ornamentation on the font at Toft Trees was of a more flowing character, and the details were exceedingly beautiful. The nine-legged font at South Wootton was very grotesque. Views of the fonts at Castle Rising, Shernborne, Ingoldisthorpe and Hunstanton were also shown, in addition to photographs of the seven-sacrament fonts at Martham, Cley and Walsoken. The lecturer also illustrated his points by photographs taken by himself of some of the beautiful Norman work at Caen, both in the Museum and at the Abbey.

Dr. Bensly read a paper on a silver-gilt ewer and basin given by Archbishop Parker in 1569 to the city of Norwich. He said in the year 1894 the late Archbishop Benson preached in Norwich Cathedral, at a special service held there on the occasion of the reopening of the choir. At the luncheon given by Dean Lefroy, after the service, the Archbishop spoke of the handsome and substantial gift of silver plate to the city of Norwich made by the celebrated Archbishop Parker, consisting of a basin or salver and ewer of silver, double gilt, weighing 175 ozs. This led to inquiry and search being made for the plate, but it could not be traced. Blomefield described the gift as "one bason and ewer of silver, double gilt, weighing 175 ozs, to be used at the mayor's table, and to be delivered from mayor to mayor by indenture for ever. The city gave bond to Bennet College, never to alienate it without the consent of the two masters of the colleges of Trinity Hall and Corpus Christi." Blomefield added, "They are now (1742) used by the Mayor, and are adorned with his arms and name in a cypher." Happily, Mr. Walter Rye had discovered among his valuable MSS. an accurate drawing of the ewer and basin, carefully made upon parchment, together with a copy of the bond, dated June 8, in the eighteenth year of Queen Elizabeth, given or intended to be given by the mayor, sheriffs, citizens and commonalty of the city of Norwich "against the alienation of the ewer and bason given to them and their successors perpetually to remain within the said city, except it be of urgent causes of necessity as should be thought reasonable by the masters of the two colleges of Corpus Christi and Trinity Hall in the University of Cambridge for the time being, or that furthermore if fortune that the said bason and ewer be lost or stolen, then the said mayors, sheriffs, citizens and commonalty for the time being do make or cause to be made the same again at their own proper costs and charges in full restitution to remain in their custody, and to be of such like form, weight and fashion as is expressed in the drawing above mentioned" (The drawing was then shown upon the screen.) For the credit of the old city it was to be hoped that a replica of this long-lost treasure might be made in accordance with the generous donor's wishes, and added to

the fine collection of City Corporation plate now so well preserved and shown in the Guildhall.

Sir Peter Eade said the late Archbishop Benson took great interest in this matter, and instructed his secretary to search in his library for anything that would throw any light upon it. He met, however, with no success. He was afraid the plate had years ago been sent to the house of some mayor, who had forgotten to return it to the Corporation plate chamber. He hoped the original plate would be discovered.

Dr. Bensly said he understood the plate could be replaced for 200*l*.

Previous to the meeting afternoon tea was provided in one of the upper rooms by the kindness of Dr. Bensly.

### SELBY ABBEY.

THE following appeal has been issued by the Rev. A. G. Tweedie, vicar of Selby:—"It is now thirteen years ago that those responsible for the care of the abbey church of Selby were able, through the liberal response from all parts of the world to their appeal, to repair the injury caused by many years of neglect, and to restore to the building some of its former beauty. At the conclusion of that work they believed that all had been done that was necessary to insure the safety of the building for many years to come. Unfortunately the last few years have revealed a danger which threatens the destruction of a large part of the work that was carried out at the expense of so much time and money. The central tower which, ever since its erection 800 years ago, has been a cause of anxiety owing to the treacherous nature of the foundations, has lately shown signs of weakness which, unless attended to at once, must result in a catastrophe similar to that which occurred in 1690, when the greater part of the tower fell, destroying the south transept and a considerable part of the choir. At a public meeting held in Selby on January 21 last a representative committee was appointed to take immediate steps to insure the safety of the tower. This committee at once communicated with Mr. J. Oldrid Scott, who for many years has been the adviser to those in charge of the abbey, and, acting on his advice, it has been decided to take down so much of the modern upper storey of the tower as is at present a source of danger. By this means the weight on the great tower piers will be reduced by more than 500 tons. In addition to this it will be necessary to repair and strengthen the remaining part of the tower. The total cost will probably not be less than 1,600*l*., not, indeed, a large sum for so important a work, and yet one quite beyond the resources of the town. The committee therefore appeal to those who take an interest in the preservation of ancient buildings to come to their assistance. This is no work of 'restoration.' Nothing is to be added in the shape of new work, and nothing will be done beyond preserving what at present exists. The keeping up this great building is at all times a heavy burden on the people of Selby, and, although they are ready to do all in their power to further the present work, they feel that they have a claim on those who share with them an interest in the preservation of 'the only complete monastic church left in Yorkshire.' The matter is one of urgency, for should an accident occur it will be too late for regret when work that can never be replaced has been destroyed. Among the hundreds of visitors who every year pass through the abbey there must be many who will be willing to contribute to the preservation of this beautiful building. I need not say that their contributions, however small, will be very gratefully acknowledged."

### VICTORIA MEMORIAL, LIVERPOOL.

A MEETING of the general committee for the erection in Liverpool of a memorial to Queen Victoria was held at the Walker Art Gallery on the 6th inst., under the chairmanship of the Lord Mayor. The committee approved a recommendation of the executive committee that the design and specification submitted by Messrs. C. J. Allen, F. M. Simpson, W. E. Willink & P. C. Thicknesse, for a monument to the memory of Her late Majesty Queen Victoria be accepted, subject to an agreement to be drawn up by the town clerk. To enable the committee to carry out this work a further sum of 1,500*l*. will be required. The model will be on view in the Walker Art Gallery. A recommendation of the executive committee that an application be made to the Corporation for the allocation of the site of St. George's Church for the memorial was confirmed.

The decision of the committee in favour of the Liverpool competitors—Professor Simpson, and Messrs. Willink & Thicknesse, architects, and Mr. Charles J. Allen, sculptor—is, in every way most satisfactory. The design, says the *Liverpool Courier*, is an admirable one; sculptor and architect will be constantly on the spot during the erection of the monument, and this, as well as their thorough knowledge of and interest in our city, can scarcely fail to have a beneficial effect on the

work. That the statuary should be executed here is peculiarly satisfactory; not only does it offer a splendid opportunity to a Liverpool citizen, who is one of the most accomplished of younger sculptors, but it will provide local students with an opportunity of participating in practical work on a large scale—than which nothing else is so valuable for educational purposes. The model of the entire memorial prepared by Mr. Allen, as we have said, be placed on view at the Walker Art Gallery.

The design represents a lofty dome supported by groups of four columns, each group flanked by two pedestals. The dome is surmounted by a bronze statue 14 feet high, representing Victory, the head poised with outspread wings on a gilded globe. The figure will be 56 feet above level of the pavement. Under the dome, which will be encrusted with gold mosaic, will stand a colossal figure, clad in robes of state, of Queen Victoria, 14 feet high, also in bronze. Surrounding the whole there will be a circle of steps on each of the four sides up to a platform beyond which other steps will rise in a reverse curve to the pedestal of the central statue.

The architectural work will all be in Portland stone, the material best suited to structures of this monumental character. Elaborate decoration has not entered into the scheme of the designers, but some attractive artistic work has been introduced at the apex of the columns. The aim of the successful competitors has been to produce a design possessing a dignity which can only be secured by broad, simple treatment. The general outline will harmonise well with the existing buildings, the town hall and custom house, which form the extremities of the vista in the centre of which the monument is to stand, and the dimensions are such that it will not be dwarfed, even by the large buildings which surround St. George's Place.

This historic site, on which in the thirteenth century was erected the castle of Liverpool, the foundation of the prosperity of the community, is a fitting spot for a monument raised to commemorate the monarch whose glorious reign brought such eminence to the city, and there can be no doubt that all who see the model will agree that a better and nobler design can scarcely be hoped for, and that the structure when completed, will be fully worthy alike of the illustrious person honoured by it and the most important site available for the second city of the Empire.

### ARCHITECTURE IN SCOTLAND.

IN describing the exhibition of the Royal Scottish Academy, which was lately opened, the *Scotsman* says:—

The architects' drawings do not include those of any work now in progress, but among them are several of the most interesting churches. Competitive designs of the Carnegie Public Library at Hawick and the Carnegie Baths at Dunfermline are hung on the walls, and the committees of these institutions would seem to have apparently been fortunate in the choice submitted to them. One of the Gothic churches which arrests attention by the elegance of its façade and the graceful character of its tower and spire is that of Greyfriars, Aberdeen, by Mr. A. Marshall Mackenzie, which is designed as to harmonise with the adjacent buildings of Marischal College, in the carrying out of which the architect is busy up for himself a beautiful memorial in the granite city. Mackenzie also shows a design for Kingseat Asylum, Aberdeen, on the cottage or villa system, the same as has been arranged for the Edinburgh Lunatic Board at Bangour. Hippolyte J. Blanc, so that the principle seems to be spreading. Hippolyte J. Blanc there is a drawing for an elegant designed carved pulpit and graceful canopy for the Trinity Coats Memorial Church, Paisley, and drawing of the serviceable and ornamental, of the Carnegie Baths and Asylum, Dunfermline. Mr. J. James Burnet exhibits an excellent piece of street architecture in the telling competition design for the National Bank buildings, Glasgow; Messrs. Peddie & Washington Browne are represented by a picturesque like front to the new station buildings at Stirling, and decorative façades for insurance buildings at Leeds and Hull. Mr. David Robertson's design for a U.F. church at Inverland has many agreeable features, and should be an ornament to the locality in which it is placed. By Mr. W. Birnie Rhind, sculptor, and Mr. T. Duncan Rhind, architect, there is an admirable and imposing design lodged in the competition for the Liverpool Queen Victoria Memorial. Intended as the centre of a square, the memorial takes the form of a massive Classic column, with groups of sculpture round the base, including a statue of the Queen and a joyous group of children. The monument rises from a spacious platform with balustrade and steps, and altogether presents a well-balanced and dignified appearance. Domestic architecture of agreeable character is shown by Mr. J. McIntyre Henry, Mr. T. T. Paterson, and Mr. John Breingan.

ISLE OF WIGHT QUEEN VICTORIA MEMORIAL.

ACCEPTED DESIGN BY P. G. STONE, F.S.A.

The above illustration shows the accepted design for the Memorial of Queen Victoria to be erected in the Isle of Wight. Mr. STONE, the author, in his statement his idea has been to design what may appropriately be called a Victoria Cross. The figures at the base of the column represent the regal virtues of Dignity,

Fortitude and Sympathy upholding the Crown, and guarded by the lions of England. Materials: Portland for steps, Hopton Wood for superstructure. Over fifty sets were received containing many excellent and original designs. The design by Mr. ISAAC JONES was placed second, and that by Mr. A. MCGAREL HOGG obtained third place.

### NOTES AND COMMENTS.

THE City of Westminster will be the scene of the most important events of the Coronation. Its streets should therefore bear witness that it is at once young and old, and while mindful of the present, is not forgetful of its past history. The Council are acting in no narrow spirit in preparing for the decoration of the thoroughfares. They have announced their desire to secure the co-operation of representative citizens outside their body. There are a great many architects within the limits of the city, and we hope they will be duly represented on the committee of advice. Sir LAURENCE ALMA-TADEMA has already given some suggestions: one being the appointment of an officer who can be accepted as an authority on heraldry. What is desirable is that streets should be treated as a whole, not with uniformity of decoration, for it would become monotonous, but by a symmetrical decoration of parts, unless there are buildings or other objects in the street which compel the adoption of a different system. At present it must be regretfully acknowledged there seems to be no disposition on the part of authorities in the City of Westminster or elsewhere to rely on the counsel of architects. Sir L. ALMA-TADEMA, Sir E. J. POYNTER and Mr. WALTER CRANE, the authorities who have assumed predominance, have no doubt introduced buildings in their paintings and drawings. But there is a great distance between buildings on canvas or paper and real buildings. The scenes which those artists have depicted would never serve for models. They want spontaneity, and would no more express the loyalty of the people during the Coronation festivities than a painted ship upon a painted ocean would serve to suggest manœuvres for the review of the fleet at Portsmouth.

At the last meeting of the "Teutonia" in Constantinople, Dr. WYEGAND read a paper on the excavations in Miletus. The most important discovery related to the old Senate House. The building was adorned with thirty-six Doric columns, and there was a semicircular hall which could accommodate about 600 members. Before the portal of the building stood a large altar on which were reliefs in marble, figures of lions, heads of cattle, besides garlands. Over the doorway, which was in the Corinthian style, was a long frieze representing a variety of arms. The building was erected about three centuries before the Christian era. Drawings are being prepared by Herr KNACKFUSS, architect, who will endeavour to explain the character of the whole building. A large number of photographs illustrated Dr. WYEGAND's paper. The discoveries have aroused much interest among archaeologists, and it is therefore unfortunate that the state of the Turkish exchequer will not allow a resumption of the excavations.

THE report of the Cathedral Board of St. Patrick's, Dublin, states that the work of restoration of the choir, which the late Dean JELLET had much at heart, made steady progress during the year 1901. The Board again express their great obligations to Lord IVEAGH for the generous help which has enabled this work to be carried out; to the cathedral architect, Sir THOMAS DREW, whose knowledge has brought to light some beautiful features of the choir which had been overlaid for many years; and to Messrs. THOMPSON, of Peterborough, whose workmen have laboured with diligence and skill in the execution of their difficult task. It is hoped that the restoration of the choir and the erection of the new organ in the chamber over the north aisle will be completed before the month of June, 1902; and the Board believe that, although the work has taken longer to execute than they anticipated when they issued their report for 1900, it will be found that the time has been well used by the workmen, and that the result will be entirely satisfactory. The work of restoration of the fabric rendered it impossible for the daily services to be held during the past year. Services were held as usual on Sundays and holy days, but the inevitable discomfort consequent on building operations, and on the disturbance of the pipes for heating the

cathedral, has had its effect on the congregations, and have sensibly fallen off, although it is hoped that this diminution is only temporary.

THE delusion which belongs to international exhibitions as a source of profit to the exhibitors has been exemplified by the returns of the French Customs Department in relation to the results of the great show of 1900. Fifty countries forwarded goods of the value of 250,000,000 frs. but the sales amounted to only 7,500,000 frs. The United States sold to the value of 1,657,000 frs. out of 29,000,000 frs.; Germany, 1,510,000 frs. out of 23,000,000 frs.; land, 905,000 frs. out of 20,000,000 frs.; Italy, 389,000 frs. out of 26,000,000 frs.; Russia, 352,000 frs. out of 22,000,000 frs.; Belgium, 255,000 frs. out of 19,000,000 frs.; Austria, 188,000 frs. out of 23,000,000 frs.; and Hungary, 166,000 frs. out of 42,000,000 frs. Customs duty to the amount of 778,000 frs. had to be paid on these sales, nearly half of which consisted of machinery, artistic objects figuring for only 55,000 frs. Taking the general imports for the year 1900, the foreign merchandise at the Exhibition represented 4.18 per cent.; and the sales only .16 per cent.

A MONOGRAPH on the work in precious metals belongs to the Græco-Roman period in the museums of Cairo has been prepared by M. KARO. The Greek age is generally taken as commencing with the foundation of Alexandria, 332 B.C. On the death of CLEOPATRA, 30 B.C., the Roman epoch began. It is difficult in many cases to discriminate between the works of native artists and the imitations of them. The most valuable example is a golden diadem which the head of the MEDUSA is represented in. The surface is engraved with a feather pattern. From a chain was suspended a medallion which has lost its top. The paintings which have survived make it clear that the diadem was worn on the back of the head, and the medallion and medallion were placed on the forehead. There are a great number of armlets. Many are in the form of snakes with emeralds in the eyes. Some of them were doubled. The oldest ear-rings are concluded to be of crescent form. The most precious consisted of smooth rings which were arranged around a pyramid. Ear-rings with pearls and with heads of animals are also common. There are a variety of rings, some having seals, and it is evident that much importance was given to seals with inscriptions on certain ornaments. Pectorals or breast ornaments were worn by those who could afford them, but judging by the examples, it would appear they were required to be in the form of a chapel with little deities. That class of jewelry was especially costly. There were few processes of the jeweller's art which were unknown to the Egyptians. In repoussé, cloisonné and other enamelling, engraving, imitation of precious stones, were all familiar to them, and the flexibility of some of the chains is surprising.

HAVING attained its eighty-fifth edition, "Laws of the Price Book" may be considered as the patriarch of all compilations. Age does not make it show any tendency to inaccuracy or loss of its variety. It represents a collection of novelties which recent years have introduced, and is multifarious in its contents as the industries it records. From the systematic arrangement, all the items are referred to with ease, and the information is as trustworthy as the organisation of "Kelly's Directories, Ltd." The law cases are brought up to 1901, and are recorded in the metropolitan police courts under the Building Act as late as November.

## THE ARCHITECTURAL ASSOCIATION.

MEETING of the Association was held on Friday evening last, Mr. W. H. Seth-Smith, president, in the Messrs. S. Leaning, E. G. Besant, R. O. Constant, Pittar and B. Procter were elected members.

Note of condolence was passed to the family of the late F. Bentley, to mark the appreciation of the Association courtesy and kindness in the past in allowing members his splendid new work at Westminster and in admiring his general work as an architect.

The following gifts to the New Premises Fund were received:—Mr. W. H. Seth-Smith (second donation) 50s., day school students 13s., Mr. Henry Muff 10s. 10s., Mr. David Scott 10s. 10s., Mr. G. Sherrin 10s. 10s., Mr. L. A. Muff 10s., Mr. W. Hilton Nash 5s., Mr. E. B. Muff 2s. 2s., Frank Green 2s. 2s.

A provisional promise from Mr. Rowland Plumbe of 100s. total sum to date of 3,923s. 15s. 6d.

Note of thanks was passed to the Pearse Portland Stone Company for presenting to the day school seven cubical blocks of different beds of Portland stone formation, and to Brumwell Thomas, through whose kind offices the same were obtained, and who had also presented some fossils. J. MILLER, of Glasgow, read his paper on

## Glasgow International Exhibition Buildings, 1901.

Dealing with this paper, before proceeding to describe the buildings in detail, I shall refer briefly to the purposes and objects of the undertaking, and also to the site and its surroundings.

The objects of the Glasgow Exhibition, as defined in the catalogue, were to exhibit the manufactures, products, and material resources of all nations, the machinery and appliances relating thereto, and to present a full illustration of progress in industry, science and art during the nineteenth century.

While the undertaking might be called international, inasmuch as most foreign countries were to some extent represented, it was not a national undertaking in the same sense as the Great World's Show at Chicago, or the various exhibitions which have been held in Paris. In its inception and development it was entirely local, and with the exception of the buildings erected by Russia, and the minor pavilions of Canada and several private exhibits, the whole of the buildings were erected by the local exhibition authorities, without any outside aid whatever.

With exhibition buildings, as with all buildings, the site is a most important factor in determining the arrangement and design of the scheme. For you can at once understand, when the area of ground is to be overlaid with a number of buildings, it is of the utmost importance that every advantage should be taken of the site and its natural surroundings, both towards the design and disposition of the buildings, in order to obtain the best result from a spectacular point of view, not of the building only, but of the whole, and at the same time to secure the most convenient and suitable arrangement for exhibition purposes.

In Chicago and the several Paris exhibitions which have preceded from time to time the symmetrical or axial plan has been adopted, and I think there can be no question that wherever it is possible to produce a plan on axial lines it is the best and grandest form. In Glasgow, however, the site at the disposal of the exhibition authorities was somewhat different from those to which I have referred. Kelvingrove Park consists of about 80 acres, at least that part of it which was available for exhibition purposes. Through its centre winds the river Clyde in serpentine curves, and on its north and north-east are ranges of high and steep slopes, crowned in the case by the University buildings designed by the late George Gilbert Scott, while the latter is surmounted by a series of terraces well designed and appropriate to their position. Viewed from the front of the main exhibition buildings these features formed a fine and, in fact, imposing background to the various temporary buildings scattered throughout the grounds.

The leading feature in determining the general arrangement of the buildings was the position of the new permanent art galleries, which have been erected on the south bank of the river directly facing the University buildings. The only large piece of ground in the park lay between the art galleries and the east boundary of the park at Gray Street, running parallel with Dumbarton Road, which formed its south boundary. The extent of this ground was about 800 feet long and 250 feet wide. There was no alternative but to place the most and most important building here, namely, the Industrial Hall, having its principal front facing the river.

Smaller open spaces were selected throughout the park for less important buildings, and an endeavour was made as far as possible to arrange these somewhat in the form of a semicircle, having for its base the front line of the Industrial Hall. No buildings were introduced within this semicircle,

the idea being to preserve this space as a large open area, to be used as a promenade from which uninterrupted views of the buildings might be obtained. It was my intention to have placed a great central feature here in the way of a monumental fountain 60 feet in diameter, surrounded by a row of columns 40 feet high, each column supporting a gilded winged figure. From the centre of the fountain rose a great circular illuminated tower 120 feet high. Such a feature would have formed a climax to the architectural scheme, repeating, as it were, the spirit of the main features of the Industrial Hall and forming a culminating point in the centre of the grounds. This feature I regret to say was never carried out. The park is studded with fine trees, but I might mention that not a single tree was sacrificed to make room for any of the buildings; we believed it better rather to sacrifice the architectural symmetry of the scheme, than to cut down these permanent embellishments of the park, remembering that the life of our exhibition was only to be six months.

I would here point out that many of the smaller buildings were introduced long after the original plans were matured; the growth of the exhibition was gradual, and its ultimate extent greatly exceeded the anticipations of the executive; in fact, as time went on, the number of the buildings increased to such an extent that it was with difficulty positions could be found for them. This explains in a measure the somewhat irregular arrangement in certain parts of the grounds. Had the full extent and scope of the scheme been approximately known at the beginning, more might have been made of it from an architectural point of view, but in any case the site was such as would not admit of anything of the nature of a symmetrical or axial arrangement of plan.

The buildings may be divided into five groups, namely, first, Industrial Hall; second, Machinery Hall; third, Grand Avenue; fourth, Concert Hall; fifth, the various restaurants, kiosks and minor exhibits throughout the grounds.

I ought to mention here that the fine arts were housed in the handsome new permanent art gallery, recently erected from the designs of Messrs. Simpson & Allen, of London. The design and arrangement of this building are, no doubt, already known to you; it is not my intention therefore to deal with it in this paper, but will confine my remarks to those structures designed by myself and carried out under my direction.

The Industrial Hall was 690 feet long by 327 feet in width; its chief features were the great dome, with its towers, peristyle and piazza. The building might be termed cruciform on plan, the dome being formed at the intersection of the main central avenue, with the two short cross avenues leading to the main street entrance in Sandyford Street and to the ceremonial entrance and piazza respectively. The dome had an internal diameter of 72 feet, and the height from the floor to the underside of the lantern was 131 feet, the extreme height from the ground line in front of the peristyle steps to the top of the flying figure on the summit of the lantern being 200 feet.

The dome rises from piers formed of timber and covered with fibrous plaster; between these spring the four arches under the dome forming the pendentives. These arches have a width of 49 feet, and are 44 feet 6 inches high to the crown. They are treated in a broad and simple manner, without any arch mouldings whatever, the pendentives being allowed simply to melt into the extrados of the arches, a form of treatment which suited the plastic material used in the construction, no attempt being made to represent or imitate a stone treatment. The interior of the dome was formed without ribs or divisions of any kind, thus forming an uninterrupted hemisphere. The effect produced by this treatment, to my mind, is to give a dome a feeling of mystery and lightness; it seems to hang or float in the air. Vertical ribs may tend to give apparent height, but with these the construction at once becomes apparent and the aerial mystery is lost.

The pendentives were enriched by large figure groups in high relief, symbolical of navigation. These groups filled the entire spandrels without any framing-in, the extreme size of the spandrels being 50 feet broad by 30 feet high. More variety and interest would have been given had the four spandrels been treated with different groups, but want of money and shortness of time prevented this being done.

The piers carrying the dome were constructed of wood up to the level of the external platform, 60 feet from the floor, the dome itself being formed of steel ribs placed at about 14 feet centres, connected at top with a braced steel ring of sufficient weight and strength to carry the flèche. Between each of the steel ribs were placed three ribs constructed of wood, 2 feet 6 inches deep, at about 4 feet 6-inch centres, with wood purlins connecting the same at exterior and interior, and cut to the curve of dome. The internal surface of the dome was covered with fibre plaster moulded to the curve, and nailed to 8-inch boarding fixed to the purlins, the fibre plates having a finishing coat of putty lime 1/2 inch thick, as on the external walls. On the outside was fixed 8-inch boarding, covered with a smooth surface floorcloth, this being the cheapest and most suitable

material we could find to take on the gilding with which the dome was covered, materials like copper or lead being considered too expensive for temporary work. As for the gilding with which the domes and turrets were covered, various materials were experimented with. Real gold leaf was beyond the purse of the committee, and various lacquers and imitation gold leaf were tried, but these soon became black in the chemically charged atmosphere of Glasgow. After various experiments we found the most satisfactory material to be aluminium leaf covered with a yellow lacquer, which gave an effect resembling real gold at about 1s. 10d. per square yard, but even this as a lasting material fell far short of the real article. The effect of aluminium leaf itself was exceedingly good; it gave a fine metallic lustre to the rounded shapes of the roofs and lasts well.

The four great towers surrounding the dome were constructed of wood. The corner posts were of pitch pine, 12 inches by 12 inches, rising from a framework formed on top of a solid bed of concrete to which it was securely bolted. The posts were scarfed at the joinings and bolted together; to each of the posts were bolted two 12-inch by 6-inch runners, the intermediate vertical pieces being 12 inches by 2½ inches. The whole framework was braced on the four outside faces by means of two layers of timber sheeting ¾ inch thick, placed close together diagonally, the outer layer being laid to the opposite angle from the one below. By this means perfect rigidity was given to the towers, and a solid surface formed on which to nail the fibre plaster boards. The four towers were in their turn bound together by the four walls forming the square enclosure out of which the dome rose. These side walls were constructed of wood, the uprights being 12 inches by 2½ inches, and the method of bracing was similar to that already described for the towers.

The outer walls of the main building were formed of 4-inch by 2-inch uprights at 2-foot centres, braced with 4-inch by 2-inch pieces. The whole of the outer surfaces of the walls as well as all the ornament were executed in fibrous plaster, which was cast in slabs 4 feet by 3 feet, and nailed direct to the timber framing. For temporary purposes fibre plaster has many advantages over wood. In the first place, it is practically fireproof, a matter of the highest importance in buildings where the structural work is mostly of wood, and which are filled to overflowing with combustible materials of all kinds. Where repetition of ornament is required it has no rival, and for colour and texture it leaves nothing to be desired. The fibre boards were all cast in the workshop and were ½ inch thick, the outside surface being left rough. They were fixed leaving a space of about ⅜ of an inch at the joinings, then the outside was entirely floated over with a finishing coat of stucco ¼ inch thick. This coating was squeezed through the joints left between the boards, and formed a key on the back similar to that formed by plaster on the back of lath. By this means the joints of the plasterwork are not so liable to show after being exposed to the weather, and a stronger and more uniform surface is obtained.

The main central avenue of the Industrial Hall had a roof of steel having a clear span of 92 feet 6 inches, or 102 feet 6 inches over the principals, and was carried through the whole length of the building, except where broken by the dome in the centre. There were seven principals on each side of the dome, spaced about 40 feet apart, connected by longitudinal purlins, on which rested the intermediate rafters. The arched principals were of box section, and formed of eight L's 4½ inches by 3½ inches by ⅝ inches with latticework between, and were designed on the three-hinged system, that is, the bases of the legs of the principals were hinged by pins 3½-inch diameter to bed-plates secured to concrete foundations, and the bed-plates were connected horizontally by a flat steel bar, 5 inches by ½ inch, to prevent the legs spreading. The principal at the apex was also joined by a hinged joint and a 4½-inch diameter pin. In its elements this type of truss is practically two girders standing on end and resting against each other at the top, where they are joined by a pin; the legs spread apart at the base, and are fixed by pins to a foundation, and prevented from spreading by the steel bar, which completes the triangle of forces.

Between the lower, or column, part of the principal along both sides of the avenue were open elliptical arched girders of steel with radiating flat bars.

Each of the principals was built in five parts, and erected by means of a steam crane with a 70-foot jib mounted on a staging 30 feet high running on wheels. There was another staging, also on wheels, behind to support the parts of the principal as they were erected.

The two bottom parts, or legs, were, of course, erected first, and kept upright by forks, one side of which was movable, connected to the back staging. The two intermediate pieces were then fitted to the legs, and finally the apex in one piece with pin in position was dropped in and the whole principal bolted up.

The side roofs were arranged in spans 42 feet wide at right

angles to the main avenue. The principals were composed of timber on the cantilever principle, and are exceptional in their scantlings, making a very cheap form of roof, are placed at 12-foot centres; the ties pass over the main bearing girders, are attached to the top of same, are continuous throughout their entire length. The side cantilever, formed of three 6½-inch by 2½-inch beams, rest on the bottom boom of the main girder, and are bolted to the ties at a distance of one-third the span from the main girder. The couples of the centre portion are simply 2½-inch single battens, the bottoms of which rest on the points of the cantilever. Immediately over the point cantilever there is a light lattice timber girder, which carries a ventilator, and also carries the ends of the astragals of the roof and supports the ends of the corrugated sheets on the portion of the roof.

The main girders which carry these principals were of timber with iron ties, and had top and bottom booms of three thicknesses of 9 inches by 4½ inches bolted to each other and having steel plates at the joinings. They were 6 inches deep, and were built continuous, their entire length being 113 feet. They were supported in the middle by a 10-inch by 10-inch solid post, so that the clear span on each side of this support was 56 feet. These girders were supported at their inner ends by the main principals of the avenue, and at the outer end by supports formed in the wall.

The astragals for these roofs were T-shaped steel plates, length, viz. 23 feet long from eave to eave, bent over the top and placed at 2 feet centres, the section being 1½ inch by 1½ inch by ¼ inch. The glass was rolled plate 3-16 inch. The glass was fixed with putty and having pins passing through the vertical members of the astragal.

The corrugated iron used was No. 24 B.W.G., not galvanised, but dipped in linseed oil, it being intended to be painted; but whether painted or not, my experience is that corrugated iron should be galvanised, even for temporary use, which is to be painted, for, if not galvanised, the thin iron will very soon corrode. Galvanising has also the advantage of increasing the strength of the sheet, making it equal to a thicker gauge in thickness; and, further, if the corrugated iron is galvanised, a better price can always be obtained for its use on a temporary building.

In designing these roofs the object kept in view was to use as few supports as possible, so as not to cut up the floor, thereby allowing the exhibits to be arranged in any way that might be found desirable.

An important point with exhibition buildings is the lighting. While windows were formed in the side walls of all the buildings, the chief source of lighting was from the roof, an area of glass in the roof should be sufficient to amply light the buildings, without reckoning on the windows, as the latter are as often as not covered up by exhibits or decorations. The area of glass in proportion to floor area in this and the other buildings was as 1 to 2; in other words, 50 superficial feet of glass to every 100 superficial feet of floor area, and the lighting, I may say, was satisfactory in every way.

When circumstances will permit I think a more even better diffused light is obtained when that part of the roof over the ridge is glazed, instead of having the roof-covering over the ridge and the glazing lower down. If the roof is a very wide second stretch of glazing may be introduced lower down the slope of the roof, but the largest section of glazing should be over the ridge.

It is important that glazing, i.e. putty glazing, should be done in dry weather. In frosty weather it is dangerous to have workmen engaged on the roofs, and in wet weather the putty does not adhere to the astragal, leakage will result, and nothing short of taking out the glass and reglazing will do a satisfactory job. For these reasons every opportunity should be taken in dry weather should be taken advantage of to get the roofs glazed.

For an exhibition, where as a rule time is limited, autumn preceding the exhibition year is perhaps the best time to get the glazing done. If it is not done before the winter sets in, and the weather becomes unsettled, it will be a difficult matter to find favourable opportunities to glaze the areas between that time and the opening in May—that was our experience; but, of course, the winter preceding our exhibition was an exceptionally severe one, with abnormally high rainfall.

In very warm weather it will be necessary to size coat the glass on all roofs facing the south, otherwise the heat will render the building very uncomfortable, especially if the roofs are inclined to be low.

In most of the exhibitions that have been held in this country the floors of the industrial section have usually been formed with battens 3 inches thick, laid with a space of 1 inch between the planks.

In the Glasgow exhibition, however, the floor of the Industrial Hall was laid with ordinary 1½-inch flooring tongue and grooved and laid close. These two methods each have

a central position near the dome were placed the principal premises, which consisted of a telling-room, manager's office, room, with cloakroom and lavatory, and strong-room. The office and post office, also exhibition manager and railway's office, with committee-room and rooms for the public and public office, were centrally situated and in positions where they could be readily seen by the public. The shipping and railway offices were also placed in prominent positions. These latter need not be large, but just sufficient to

(To be concluded.)

**Mr. J. Sulman**, architect, delivered an address at the Science Congress in Sydney, in which he said that in future houses would have to be built on different lines, so that the people could conveniently do their own work. The kitchen might be reformed, the cooking being done by gas or electricity. He described methods to be adopted in labour saving, and advocated a simpler style of furnishing. The washing-up difficulty after meals he proposed to get over by cleaning the plates and dishes with a chemical solution, and then drying by heat. An apparatus to do this work would be tried shortly in Sydney.

### THE WHITECHAPEL ART GALLERY.

THE annual report by Canon Barnett, which has just been issued, shows that the whole of the 16,000*l.* required for land and building has now been raised, though funds are much wanted for maintenance. The trustees are more than satisfied by their experience. Their aim has been to open to the people of East London a larger world than that in which they usually work, to draw them to a pleasure recreating to their minds and to stir in them a human curiosity. The people came in greater numbers than was expected; they came both to enjoy and to question, they bought catalogues by the thousand, they attended lectures and they welcomed guidance. There was always perfect order, and the donations of small coin have marked the general approval. The spring exhibition, opened by Lord Rosebery on March 12, 1901, was visited by 206,000 people, including large numbers of Board school children. The Chinese exhibition from July 25 to September 4 had 137,000 visitors, and in the first five weeks of the Scottish exhibition, which was still open when the report was written, the visitors numbered 90,000. The catalogues sold during the first two exhibitions numbered 38,200 and 21,000 respectively. It is not proposed to make a permanent collection at the gallery, but it is proposed that a library of books on art, a collection of lantern slides to illustrate lectures on pictures, sculpture and architecture, and a collection of photographs and process reproductions of pictures should be formed. These would be lent to people or institutions interested in studying art or in spreading interest in art in the East End. A lending picture gallery might also be established, from which the people might borrow pictures as they now borrowed books at free libraries. Gifts of sketches, photographs, engravings, books or slides for these purposes would be gladly welcomed by the director. A small beginning has already been made.

### THE GLASGOW ART GALLERY.

THE parks committee of Glasgow Corporation recommend that the new art galleries should be known as the Glasgow Art Gallery and Museum (Kelvingrove). The committee have approved generally of a memorandum as to organisation drawn up by Mr. James Paton, the superintendent. The upper floors are to be occupied with the Fine Art department, except the division of sculpture, to which a portion at least of the central hall must be devoted. The east wing of the ground-floor is to be given over to natural history, and the west wing for the technological and archaeological departments. Mr. Paton suggests that the classification of the works in the picture galleries should be:—Early pictures, modern works, water-colour drawings, special collections and drawings, prints, photographs and other reproductions. The balconies of the upper floor around the grand hall and over the north and south entrances afford space for the collections of Applied Art, which include carvings in ivory, wood and other media, metalwork, pottery, glass, textiles, and lace and embroidery, &c. Mr. Paton says that the sculpture at present owned by the Corporation is not sufficient to adequately occupy the spacious central hall, and a most unfavourable impression would be produced if that grand hall presented a bare, poverty-stricken appearance. Casts of statuary and of sculpture, however, of high artistic and historical value can always be obtained for comparatively moderate expenditure, and it is most desirable that a well selected series of such casts should be provided without delay. At the same time, it would be a mistake to crowd up the floor space of the hall, which will fall to be used as a reception hall on ceremonial occasions, and as a free promenade for the hearing of music when performances take place. The technological collections embrace—raw products of commerce, manufacturing processes and products and mechanical arts, such as engineering, shipbuilding and architectural works. For the archaeological collections accommodation should be provided in the west wing, as in that side the series of heavy casts of sculptured stones is already installed. These might be classified thus—general archaeology and local antiquities and memorials of Glasgow. It is highly desirable that the series of sculptured stones of Scotland should continue to be added to as opportunity occurs till casts of all the more important of these significant memorials of early life and civilisation are secured. Already a very valuable nucleus of such a series belongs to the institution, and the cost of adding to it would be very moderate. Casts of outstanding examples of similar works from foreign sources should also be obtained. The east wing, devoted to the natural history side of the institution, has to afford accommodation for zoology, ethnology, geology and palæontology, and mineralogy. The open court is the most convenient position for a mammalian collection. One saloon then would alone remain for the lower vertebrates and for all the invertebrates. A pavilion should be devoted to British and local natural history, leaving a

saloon for ethnography or the natural history of man, a saloon for geology and palæontology, with a pavilion for mineralogy. The institution is yet very deficient in collections of mammals, which, in all museums of natural history, are the most popular, if not the most instructive objects. The up the blanks in such a collection is a mere question of expenditure. Hitherto the entire absence of space for a mammalian collection has precluded any attempt at systematic development of such a series, and only specimens incidentally offered have been acquired. Thanks to gifts and purchases, the collections of fossils, rocks and minerals belonging to the museums are now extensive and of great value. Hitherto a portion of these only has been exhibited in the Green branch, but such collections are much too specialised to be of general usefulness in the People's Museum. It is therefore suggested that the collections should be transferred, and that a type of school collection of zoology be substituted for them. Such a collection would not only be much more popular and attractive than rocks and fossils, it would also be most valuable for the elementary instruction of school children, and for students of natural history generally. Having now a building in which treasures of all kinds can be exhibited with the utmost freedom from injury, Mr. Paton suggests that the committee should consider the propriety of resuscitating the scheme of special loan collections, which a period was carried out with marked success in the Corporation Galleries. The inauguration of the institution, he says, be an event of more than local importance, and it should be considered whether some special effort should not be made to give due éclat to the occasion. An appeal to owners of art treasures for their support and assistance towards making the initiatory stage of the institution a success would be likely to meet with a cordial response.

### LECTURES ON SCULPTURE.

IN the final lecture of his course, Mr. Alfred Gilbert remarked that he had left much unsaid, as his material had to be got into the smallest space, but he hoped the Art students could pick up the thought-threads in his brain as lenient to him if he failed. This lecture's title, "To a Good End," might be as enigmatical as the headings of the other lectures had been until he enlightened them; but it was also one which applied specially to himself, as it was the last lecture of the year. He wanted them to take these title words and apply them to their own lives as men and women, not only as do with sticks and clay. Their calling was the grandest profession of any save the one of healing; but they must remember the impulse which drew them to that particular mode of expression could equally well have been trained to painting, though, perhaps, not to architecture. Sculpture was, in fact, the most difficult of the arts, but it was personal, and an architect had to be something more than personal, and he created or achieved must be perfect, whatsoever he left it in, and he must likewise be the master of many crafts. A grand factor towards the proper end of the faculty of memory, the influence of this coming to a chance scent, sight, or sound, making strong impressions of originality. A peal of bells to one would be joyous to another sad, while to a third its retrospective action would be of happiness cloaked with sadness. The memory should only be unlocked to beautiful things, and students should question themselves as to why they considered a thing beautiful. Their works should be imbued and burdened with memory of all the finest they had seen; and if they accomplished this they would never make an ugly statue, and so would destroy it, for, unless they broke it, it would break their hearts. They must not eschew memory and tradition, or *vice versa*, but in making a memory piece must not forget what tradition had handed down of beauty, and with the heart's blood of their authors. He who was afraid of being upset by studying the works of others was in the character of a very poor jackal to a very large lion, who who copied the great was no more than a monkey. What inspiration was sometimes regarded as a sort of divine gift. It was true an artist must be born an artist, but he must have his trade just as a joiner or a plumber must. Their right hands must be well acquainted, for when the one does not know what the other was doing want of inspiration was the result. Fads and new fashions were to be left behind, for this cheap-jack means to spurious reputation. Life's ambition, he said, was the stirrup-cup which, if poisoned, would prevent completion of their journey; but, if sweet, would keep them long for the next stop that they might drink. Some might think life's ambition realised were they permitted to do a beautiful thing; but if tied to a clock, time, and bound by approval of a committee, they had no free hand, and should not submit to this, for if, as they gave their brains, they should not be told by

to use them, or that they were all wrong, by one who never did right. Stupid, inconsequent remarks he knew to be heart-breaking, though they did not kill; they must know themselves, and always strive after the best, for that was the love of the future, because it assured them more love than they could bear during existence. Not to be forgotten was difficult enough. He warned the students never to make things in sadness, but always to work with a joyous heart, and is they could not do if they were in doubt. They were to be determined to get right what they decided on, and if they tackled it in this spirit a brick wall would crumble into dust and make a way for others to enter. Such intensity of intention would probably equip them for riding that horse with irrup's strong and sweet cup that sent them on the journey to proper end.

## BRICKLAYING AT THE WESTINGHOUSE WORKS.

THE following letter from Mr. J. C. Stewart, the building manager, has appeared in the *Times*:—As doubt has been thrown in some quarters upon certain statements made by your engineering correspondent in his article on the construction of the British Westinghouse Electric and Manufacturing Company's works at Manchester in your issue of February 25, you may perhaps permit me to say that he rather understated than overstated the facts.

Your correspondent said:—

"A record is kept of the work done by each man per day, and I was allowed to see the records of the time-keepers. The sheets, taken at random and without selection, showed sometimes as much as 1,400 bricks laid per day by one man, and it was said that a total of 1,800 was hoped for, though I did not understand that had been reached. At any rate, 1,400 a day is a sufficiently good total compared to the 450 or less which is considered a fair standard in places. It must be remembered, however, in regard to this question that there is a great difference in the quality of bricklaying. What is good enough for rough work out of sight will not do for the fronts of high-class dwellings, not to speak of such refinements as rubbed bricks. Doubtless the higher totals would represent work that could not need much attention."

When your correspondent visited the works in the early part of November we had reached a regular average of 1,400 bricks per man per day, and on some days we had laid as many as 1,800 bricks per man. A little later we commenced work on the pattern shop, where there are fewer openings in the walls than in any of the other buildings. In the construction of the pattern shop our regular average was 1,800 bricks per man per day. This building, which is 578 feet in length by 90 feet in width, and is absolutely fireproof, was completed in the latter part of December.

It has been elsewhere publicly asked, "What is the thickness of the walls? Was mortar or cement used?"

I will say that in no instance are the walls less than 9 inches thick, and that in some instances they are 23 inches thick. Mortar was used.

All our walls are "piers." In the centre of each brick pier is a large "Z" bar steel column.

With one exception all the buildings are faced with what is known in the trade as Number 2 stock brick. The exception is the six-storey office building, 250 feet by 50 feet, which is faced with Number 1 stock brick. These facts will indicate to men who understand the business the high grade of work and the care it requires. The averages I have mentioned per man include face brickwork. On common work we reached an average of 2,250 bricks per man per day.

It will doubtless be regarded as a matter of public interest that our bricklaying at Manchester, which seems to us not unusual, but which has attracted so much attention in this country, was attained under the direction of our bricklayer superintendents, both of them Englishmen and members of the Bricklayers' Union. The head superintendent has never been in America, but his principal assistant spent five years there, returning here some five years ago, and has remained here ever since. The bricklaying has been directly under their supervision and under the general direction of my general superintendent and myself.

If further evidence be required of the number of bricks that English workmen are capable of laying in one day of 8 hours, when assisted by up-to-date methods of handling brick and mortar, I may call attention to the brick chimney stack which we are now erecting for the Mersey Tunnel power station at Birkenhead. This chimney is to be 250 feet high. Its base is 24 feet square, and its flue is 13 feet in diameter. It has an inside wall or ring separate from the outer walls, and consequently there are four faces to the stack. The first, 5 feet on the inside, is lined with fire-brick. Work was started on January 11. During the month of January, on account of the extra care required in lining the flue with fire-

brick, the construction of the flue openings, and the setting of the stone base and coping to the square base, our brick-laying average per day was only 1,533 and 1,600 per man per day of 8½ hours.

From February 1, however, we had plain sailing, and the average number of bricks laid per man per day was as follows:—February 1, 1,275 bricks (half day); 2, Sunday; 3, 1,393 (two hours lost, accident to brickhoist); 4, 1,894; 5, 1,968; 6 to 8, no work done on account of bad weather; 9, Sunday; 10, 2,022; 11 to 14, no work, snowing and cold; 15, 1,278 (half day); 16, Sunday; 17, 2,097; 18, 1,763; 19, 2,145; 20, 2,086; 21, 1,979; 22, no work, raining; 23, Sunday; 24, 857 (half day)—20,757 brick-average per man for 10½ days.

This shows an average per man, per day of, say, nine hours, of 1,976 bricks. The men worked 8½ hours per day up to and including February 11, and nine hours per day since that date.

This Birkenhead average has been made possible, partly, to quote the words of the bricklayers themselves, by "facilities which are unusual in this country."

Some features which seem to have attracted considerable attention at Birkenhead are the methods of outside scaffolding for building the brick stack, and the double platform lift, each platform holding two barrows of bricks; one ascending while the other descends. The time occupied in raising one platform from the ground to the height of the stack, which to-day is 150 feet, is only 15 seconds. Another feature which the men regard favourably as helping them to do rapid work is our method of making mortar. Our mortar is made much softer than that commonly used in England, and the bricks are laid by a light pressure of the hand and a light tap of the trowel, instead of by repeated hammering of the trowel to force the brick into place in stiff mortar. By the use of soft mortar we can lay enough mortar with one stretch of the trowel for half a dozen to a dozen bricks. With stiff mortar, such as masons use in this country, it is possible only to spread enough at one time for a much smaller number of bricks, as the stiff mortar leaves the trowel in a mass and will not spread freely.

I might add that at the height now reached by the Mersey stack we have gone beyond the point where it is practicable to continue with outside scaffolding. From this point upwards we will lay our bricks with greater economy by hoisting the brick on the inside of the stack and using inside scaffolding.

All the bricklayers, including the foreman, engaged on the construction of this stack are British workmen, and all of them are members of the Bricklayers' Union. The rate of wages paid to our bricklayers is 11½d. per hour. This is 1½d. per hour above the trade-union rate. The foreman is paid a special rate.

Each evening as the men stop work a mark is made on the stack, and the next evening measurements are made for ascertaining the number of feet and inches the stack has increased in height during the day. The calculation is based on fourteen bricks to the cubic foot, and the average number of bricks stated in this letter is the result of these calculations. The bricks used in the Manchester and Liverpool district are about 20 per cent. larger than those used in the London district.

My experience in connection with the successful handling of British workmen in Great Britain is:—

First, the men must satisfy themselves that they are to be paid good wages.

Second, the man who has general charge of the work must understand his business, and have his work done in his own way, in his own time and by his own methods.

It seems difficult, if not impossible, to learn what is really considered a day's work in British bricklaying. On one hand it is stated that on some constructions the figures are 330 bricks per man per day, on the other hand other contractors in the same district have in their employ men who lay 500 to 700 bricks.

In the United States a man's average per day is from 2,000 bricks on the best class work—say, private residences—and this includes face brick as well as common, to 2,500 and even 2,700, including face and common, on other structures.

It may seem strange to the people of this country, but it is a fact, that British bricklayers who go to America work side by side there with American bricklayers and equal their average.

It may be to the point if I add that, besides bricklaying, we have achieved results in the construction of the British Westinghouse Company's works at Manchester which are not less notable than those to which reference has been made.

For instance, results have been attained here by British carpenters just as quickly and cheaply as I have ever accomplished similar work in America.

To the unbiased man facts like these afford conclusive proof that British workmen, if they diligently apply themselves, do as much as the workmen of any other country.

Finally, I will say with regard to union men that, if our work has been rapidly executed, it has been greatly due to the interest that has been taken by the representatives of the unions in securing for us the best men that could be obtained.

At the meeting of the London County Council, Captain Swinton asked Lord Welby if, remembering that he felt himself justified in saying no more in his report than that 330 bricks per man per day is considerably below the number actually laid by the Council bricklayers, he had read the letter on bricklaying sent by Mr. J. C. Stewart, building manager of the British Westinghouse Electric Company, of Manchester, to the *Times*, and the leading article upon it; whether, remembering also that some members of this Council laughed to scorn the idea that it was possible to lay even 1,000 bricks a day, he had noted that Mr. Stewart made this statement, "This shows an average per man per day of, say, nine hours, of 1,976 bricks;" whether he would take steps to test the truth of this statement and also, in the interests of the works committee and the ratepayers, investigate the methods and those "facilities which are unusual in this country" which apparently enabled Mr. Stewart to carry out his work at this speed with British workmen, all of whom, including the foreman, were members of the Bricklayers' Union?

Mr. Taylor asked whether the chairman of the committee would be able to ascertain whether the work mentioned by Captain Swinton and Mr. Stewart was comparable to any work done by the County Council.

Lord Welby, in reply, said that Captain Swinton was putting his question to a moribund, if not a defunct body. The sub-committee of the finance committee on the works department was at the present moment expiring, and, if the sub-committee acted in the interval before the new works committee, it would be in the nature of a committee d'affaires. He therefore suggested that the question should be addressed to the incoming committee.

## THE BROTHERS CARSWELL OF GLASGOW.

A LETTER has appeared in the *Glasgow Herald* from Mr. J. F. S. Gordon, in which he says:—

Our several city museums and connoisseurs have preserved in paintings, water-colours and photographs houses and closes of historical and criminal interest which have been demolished. Albeit, a century's partial retrospect may be acceptable to your readers. Glasgow had then a population of about 60,000 when two brothers, William and James Carswell, born in the vicinity of Kilmarnock, commenced business as wrights and builders. They had to cut down the corn in that part of what is now George Street lying between High Street and Balmano Street. This clearing was done in order to erect their long well-known workshops. In 1790 the "fortalices" enumerated in the City Records, ably edited by Mr. R. Renwick, as existing at an early epoch in the Stockwell near the West Port, were estranged, and the field which now embraces George Street had a solitary footpath. The patricians of the city resided in their "splendid self-contained mansions" in Virginia Street, Miller Street, Charlotte Street and St Andrew's Square. Brilliant fortunes were made in the "Golden Acre" in dark and dingy booths, accessible by break-neck stairs, wherein a man of more than middle-sized altitude was in peril of bumping his head against the ceiling. The office-plenishing and office-bearers were correspondent. There were no steel pens; a considerable trade was done in swan and goose quills, still used in the Houses of Parliament. Dominion to a man were Protestant against the more universal adoption of a noble invention. Praiseworthy zeal is being exercised to improve human habitations in style and accommodation, but the twain Carswells are entitled to the credit of first uprooting dismal, confined hovels by the score. Not only so, but their attention was turned to dignify and elevate the abodes of the increasing industrious middle-class population. Marvellous advance has been made in the course of a century, and improvements, sanitary and otherwise, have gone far beyond the plans which the Carswells laid down, but they certainly carried out conveniences which were greatly appreciated. Almost the whole of the Candleriggs owes its existence to them, including Commercial Court, with its surrounding warehouses. Their model of architecture was that upon which so many courts have been built. For some of the ground in the neighbourhood of the Bazaar or Old Green Market they had the enterprise to pay 32l. per square yard. They were also the contractors of Albion Street, Albion Court and George Street on both sides from Montrose Street eastward. They purchased the old Merchants' Hall in the Briggate, and, removing it (with the exception of the fine steeple built in 1659) and the ruinous and wretched tenements adjacent, replaced them by Guildry Court, also recently improved. The Carswells built a portion of Cochran Street and a good part of Miller Street. They were so far-sighted and "Scotch canny" in their go-ahead operations in some localities as to plan, let and even sell the future buildings before the ground upon which they were to be erected was actually secured. They built the whole of Richmond Street, which was opined to be a unique model of "genteel snuggeries." The style of stairs was proverbial,

"because they will always have a peculiarly neat and compact aspect." Ingram Court, Queen Court and various buildings the north-east part of the city testify to their ingenious development in design. Besides their large building trade, the Carswells were in their day the most extensive contractors wrights in Glasgow. Many erections in the neighbourhood of the Royal Exchange, in London Street, High Street, &c., exemplify the substantial character of the work turned out by their hands. They were the first to introduce iron pillars in buildings, and also the first movers to get water from the City inside dwelling-houses. So much was this valued that the water company of an early day remitted to them the rate for their own individual dwelling-houses and warehouses. Sauchiehall Street and the West End then were not. Harlebyes then occupied the east of Sauchiehall Road, and the baths, named Bath Street. Within the last three years, wide changes have taken place from Bell o' the Brae downward through High Street and Saltmarket. Bailie Nicol Jarvie would indeed exclaim "my conscience" were he to take a stroll on the Green through the "Nether Barras" yet Glasgow has been bereaved of its ports, and has not even a market or city cross. "Rookeries" (your readers know who originated the appellation) immortalised in our picture galleries, but with the risk of fire, have timeously been eradicated, while the Glasgow and South-Western Railway is present covering former wynds and closes by the extension to St. Enoch Station. The Bridgegate Free Church, with its interdicted outside pristine stone pulpit and striking saddle-back towers, holds fast firmly as a "Protestant" landmark.

## MOGHUL ARCHITECTURE.

ANOTHER of the remarkable reports with which his name is associated has appeared from Mr. Edmund W. Smith, Government archaeological surveyor in the North-West Provinces and Oudh. After he had completed the survey of the Akbar's city at Fatehpur Sikri, the Indian Government instructed him to visit the Chini-ka-rouza, a tomb ascribed to Afzal Khan, a poet who died in Lahore over two and a half centuries ago. Mr. Smith describes it as one of the most interesting buildings in Agra, though it is little known. It is hardly to be wondered at, for the Taj eclipses all other buildings in that city, and the Chini-ka-rouza is lost by consequence of its proximity. But of its kind it is claimed that the mausoleum is unique, being about the only building in Northern India entirely ornamented exteriorly with enamelled tiles. For many years, it seems, the building was neglected and the zamindar cultivating the adjacent fields lived in it, and irreparably spoilt most of the painted decorations on the walls and ceilings by lighting fires in the rooms for cooking purposes. He has been evicted, and the local government has now taken charge of the tomb and repaired it sufficiently to prevent it falling into further decay. Mr. Smith's purpose was to point out the beauties of Moghul architecture and the color decoration employed in connection with it. To do this takes us also to the Kanch Mahal and Akbar's tomb. For hundreds of years of Moghul architecture produced two schools, so, but under Shah Jehan the Hindu element becomes less and less prominent till it gradually fades away. The Hindu bracket and flat architrave used over the apertures of doorways and windows makes way for the Mohammedan arch and the beautiful carved geometrical decoration in red sandstone found at Fatehpur Sikri, and the Jehangir Mahal in the fort. Agra gives place to mosaic.

Akbar's buildings are known to be not entirely devoid of colour ornamentation, and some of the Fatehpur Sikri buildings, towards the end of Akbar's rule, were richly decorated with frescoes. Marble mosaic was used in the Jumna Masjid. The Pathans used marble to enliven the severeness of the façades. But it was not until the reign of Shah Jehan that coloured inlaid ornamentation became a leading characteristic of the style. Besides marble mosaic and inlaying, the Moghuls are shown to have relied to some extent on enamelled tiles. Akbar used encaustic tiling. Fresco-painting was also extensively employed by the Moghuls for decorative purposes, and in many of their buildings, commencing with Akbar's time,

escos were used frequently upon the interior walls of their palaces and tombs. Few Moghul buildings were entirely covered with enamelled tiling, and about the only one in northern India is the Chini-ka-rouza. But its glory had almost departed when Mr. Smith went to see it. It once stood in a garden which is now a field. From top to bottom it is covered with mosaic tiling in a variety of colours, worked up into numerous patterns so as to form one unbroken flat surface. The interior is floated with stucco painted with rich and bright floral designs. The crypt of the building for years was used as a little shed, and the result is that very little is left of the dados which were of coloured tiling. The patterns were made up of thousands of small tiles. The decoration is found, contrary to the opinion of many, not to be all in one piece. It has been proved that the various patterns the tiles were to assume were first traced upon the plaster, when in a plastic state, after which the tiles were laid according to it. Mr. Smith will not definitely commit himself as to what substance the tiles are composed of, though it is evident that they are encaustic. The glazed surface is only the thickness of the blade of a knife, and the thing is sure, that they have certainly been subjected to heat and are not merely made of mortar or cement enamelled over, as has been asserted. The present beauty of the building is due to a great extent by the absence of tiling round the top and bottom of the façades, partly owing to natural causes, and partly to the fact that visitors have knocked out pieces and carried them away as relics.

Sir George Birdwood, in his "Industrial Arts of India," thinks that the enamelled pottery of Sindh and the Punjab is probably not older than the time of Genghiz Khan and in all the Imperial Moghul cities of India where it is practised, especially in Lahore and Delhi, the tradition is that it was introduced from China, through Persia, by the Afghan Mongols, through the influence of Tamerlane's Chinese wife. But in Persia, the ancient art of glazing earthenware came down in an almost unbroken line from the period of the greatness of Chaldaea and Assyria. However that may be, it is probable that the Chini-ka-rouza was decorated by artists of no mean order, and though most of it may have been done by the Indian workers, Mr. Smith thinks it is not impossible that Chinese decorators assisted in the work. Imad-ud-Dowla's tomb is decorated in a manner so similar to the Chini-ka-rouza that it may have been worked by the same artists. It is believed to have been begun by Akbar and finished by Jehangir. Imad was the father of Jehangir's wife, Nurjahan, and his tomb is so beautifully decorated that the Survey Department proposes to devote a separate volume to its treatment. The style of the architecture of the Kanch Mahal is supposed to belong to the early part of the seventeenth century, when the floridness which marks and is so characteristic of the later Moghul style commenced to be fashionable. It is believed that the place was erected by Jehangir as a country seat, where the emperor and his wife, Mumtaz Mahal, could retire from the court at Agra to enjoy the solitude of the country, and within view of the beautiful grounds surrounding the mausoleum he had erected to the memory of Akbar. Suraj Bhan-ka-bagh is a sister house to the Kanch Mahal, most elaborately ornamented, and Mr. Smith urges the preservation of the two as typical specimens of seventeenth-century Mohammedan architecture. In careful colouring he has reproduced the designs employed in the decoration of these buildings, enabling the reader to form, at least, an approximate idea of bygone days, and, we fear, bygone art, for the style of decoration to be found here was but transitory favour. Yet it is remarkable that in modern times the practice has not been perpetuated, for, as Sir George Birdwood says, the sight of wonder is when travelling over the ruins of Persia or India suddenly to come upon an encaustic tiled mosque. It is coloured all over in yellow, green, blue and other hues; and as a distant view of it is caught at sunrise its stately domes and glittering minarets seem made of the purest gold, like glass enamelled in azure and green, a fairy-like apparition of inexpressible grace and the most enchanting splendour.

#### SUSSEX ARCHÆOLOGICAL SOCIETY.

THE annual report of the Sussex Archaeological Society has been issued. The most important work carried on by the Society during the past year has been the excavations of the site of the great infirmary at Lewes Priory, which are now practically completed. In addition to the remains of the chapel which were uncovered in 1900 the great hall has been found. This building was 113 feet in length and 63 feet in breadth, and stood on the level platform south of the chapel and east of the great dormitory of the priory. It was divided into a central portion with two aisles, from which the former was separated by two rows of four arches, each springing from massive piers. To the east of the great hall the foundations of the kitchen and other domestic buildings attached to the hall

have also been uncovered. The result of these excavations has been the discovery of a perfect plan of a large Cluniac "farmery," and the Society is indebted to the owner, Mr. E. B. Blaker, and the lessee, Mr. F. G. Courthope, for the ready way in which they met the views of the Society. The Society has also derived most valuable assistance from Mr. St. John Hope, who spent a week at Lewes in December, and personally superintended the excavations during that period with Mr. Harold Brakspear, F.S.A., and the hon. secretary. With regard to our other abbeys and priories, it is noteworthy that, with the exception of the plan of Lewes Priory by Mr. St. John Hope, which appeared in Vol. XXXIV., there are no perfect plans in the "Collections" of any of the monastic remains in Sussex, and the Council hope in the future to remedy this deficiency by arranging for their measuring and planning. At the same time it is hoped that funds will allow of what excavations may be necessary to clear up doubtful points in the arrangements being undertaken.

The recent exhibition of Sussex ironwork is referred to, satisfaction recorded that representatives of the Barons of the Cinque Ports will attend the Coronation, and regret expressed at the death of Mr. J. L. André and other members of the Society. The number of visitors to the castle during the year was 5,854, against 5,744 in the previous year. Forty-eight new members were elected during the year, and the total number on December 31, 1901, was 648, compared with 631 in the previous year. The receipts during the year were 569*l.* 16*s.* 4*d.*, including 93*l.* 16*s.* 2*d.* balance in hand at the start, 296*l.* 17*s.* 6*d.* from subscriptions, and 146*l.* 7*s.* for admissions to the castle. The expenditure exceeded the income by 18*l.* 5*s.* 3*d.*, the balance in hand at the end of the year being 75*l.* 10*s.* 11*d.* The general expenses amounted to 100*l.* 8*s.* 4*d.*, and printing to 225*l.* 7*s.* 1*d.*, while the loss on the annual excursion was 9*l.* 10*s.*

#### TESSERÆ.

##### The Dome of the Paris Panthéon.

THE dome of the Panthéon at Paris, beneath which the centenary of Victor Hugo was celebrated, is constructed entirely of stone, and is placed in the centre of a Greek cross. It is supported by four triangular piers strengthened by engaged columns of the Corinthian order. The four piers with the lines of the intermediate arches form externally a large square, each side of which is 74 feet 9 inches. These four piers are pierced above with arched openings, and between the piers with the openings are large arches, the diameter of which is 44 feet 11½ inches, and the height 85 feet 5 inches. Between these arches rise the corbellings, which are gathered in to form the circular plan of the drum. The arches and the corbellings are crowned with a large entablature 13 feet 4 inches high. The upper part of the cornice of the entablature is raised 101 feet above the pavement of the nave. The diameter taken at the frieze is 66 feet. The internal drum which is constructed on this entablature is 55 feet 7½ inches in height to the springing of the internal dome. The interior of this drum is decorated with a continuous stylobate, which is the basement of a colonnade of sixteen Corinthian columns almost isolated from the wall. These columns are 35 feet 2½ inches in height. Between the columns are sixteen windows; four of which are false, and placed above the four piers of the dome. The colonnade is crowned with an entablature, above which is a large plinth which rises to the springing of the internal dome. The internal dome is 66 feet 8½ inches in diameter at the springing, and is decorated with octagonal caissons or sinkings with a rose in the centre of each. The eye at the top of the dome is 31 feet 3½ inches in diameter. Through this eye is seen the upper part of another or intermediate dome. The external dome is placed on a circular base 108 feet 7½ inches in diameter and square at the bottom. The angles are strengthened by flying buttresses. Above the corbellings a circular wall is constructed, forming an external continuous stylobate which supports an external colonnade. The external colonnade constructed on the stylobate forms a peristyle round the dome, and is composed of thirty-two isolated columns of the Corinthian order 36 feet 5½ inches high. This colonnade is divided into four parts by the solid constructions in masonry raised over the four piers. The external colonnade is surmounted with an entablature and balustrade above it. There is an attic constructed above the circular wall of the drum, set back 13 feet 10 inches, and pierced with sixteen windows, twelve of which light the space between the internal dome and the intermediate dome which bears the lantern. This attic is terminated with a cornice with a step or plinth above. The external dome, 77 feet 8½ inches in diameter, measured on the outside, is constructed with masonry; the height is 45 feet 9½ inches from the top of the attic to the underside of the finishing against which the curve terminates. The outside of the dome is covered with lead, and is equally divided vertically by sixteen projecting ribs. The intermediate dome, built for the purpose

of carrying the lantern, was intended to be decorated with subjects by the painter. The form of this dome resembles the small end of an egg; its springing commences at the base of the attic at the point where the internal dome begins to disengage itself. This dome is 50 feet  $\frac{3}{4}$  inch high, feet  $3\frac{1}{2}$  and 70 inches in diameter, and is pierced with four great openings at the lower part 37 feet 3 inches high and 30 feet  $10\frac{1}{2}$  inches wide at the base. On a circular platform above the summit of the dome are eight piers with arches, which support the finishing against which the external dome terminates. Above this is the lantern of the dome.

#### The Reform Club, Pall Mall.

The Reform Club-house, although far from perfect, is a very great advance upon previous essays in the Italian style, as illustrated by the painted compo-works of Nash in some structures for similar purposes erected in and about Waterloo Place; but yet if Barry had to design another from the same materials as that of the Reform he would make very considerable improvement upon it. It is generally admitted that one of the great secrets of architectural designing consists in the judicious distribution of plain and enriched surfaces, so that there may be no undue baldness in one portion nor an excess of enrichment or moulded work in another. In this peculiar quality Barry sometimes failed; he has done so in the present instance, for no one we think will doubt that there is too much plain wall-surface between the top of the first-floor windows and the string-course above, which serves as a continuous ornamented sill for the upper windows. Looked at, however, as a whole, this club-house is a truly noble pile, and it is a pleasant task to advert to some of its undoubted beauties. The range of windows at the first-floor level are most successfully treated, having Ionic columns projected from their jambs, with the usual entablature, and pediments above, underneath the corona of which are plain modillions, simple and highly effective. These windows have open balustrading at their sills with pedestals at either side, and continued panelled work between each. Underneath is an enriched string-course, with mouldings broken round the sills supported by moulded trusses. The entrance doorway is in the exact centre of the façade, and is admirably proportioned, with a highly judicious distribution of enrichment in its details; it is Ionic, with modillions in its cornice, which is supported at each end by elegant moulded trusses, across the faces of which are suspended swags of flowers from the pateræ on the centre of the volutes. The principal cornice at the eaves is very elaborate in its enrichments, but is somewhat too large in its proportions. The surfaces of the walls between the windows throughout the whole building are perfectly plain, no channellings or rustic-work being employed, except at the quoins, which are chamfered. The boundary wall next the foot pavement is very elegant in its composition, being composed of pillars with well-designed candelabra upon them. Between the pillars are square balusters and the usual coping.

#### GENERAL.

**The King** has been pleased to command Mr. W. H. St. John Hope, assistant secretary of the Society of Antiquaries, to undertake and complete the architectural history of Windsor Castle.

**Mr. W. G. Doolin, M.A.**, who was long known in Dublin as an architect, has died in that city, after two days' illness.

**A General Meeting** of the Royal Society of British Artists was held on Monday, when Miss Lucy Kemp-Welch and Mrs. Jopling were elected members, these being the first lady members admitted to the Society.

**A Service** to commemorate the complete restoration of Peterborough Cathedral is to be held in July. The works have been in progress eighteen years, and have cost over 80,000*l*.

**Mr Percy Fitzgerald, M.A.**, on Wednesday delivered a lecture in Leighton House, Kensington, on Robert Adam, the architect.

**The Bavarian Parliament** have made a grant of 6,000*l*. for carrying out the restoration of the tombs of the old German emperors in the cathedral at Speyer.

**The Brighton Town Council** have agreed to petition the House of Lords in order that the Bill for the Electric Railway may be considered regardless of the defects found in the plans.

**Blackpool Promenade** is to be widened with basaltic stone from German quarries, although suitable stone is to be found in Great Britain.

**The Late Mr. Bentley** has left drawings and designs and colour schemes for the decoration of the Westminster Cathedral in a very forward state of preparation. It is anticipated that no difficulties will be experienced on the part of those who were accustomed to work with him in giving complete expression to his ideas.

**Relics of a Roman Villa** have been discovered in a field near Winchester on the east side of main road to Southampton. Some gardeners in working the ground for gardening have disturbed the upper foundation-walls of big flints, fragmentary flanged tiles of the hypocaust, drain and roof tiles, pieces of stone, pottery and large tiles.

**The Engineering Students** at the Polytechnic Night School, Vienna, have decided not to attend any more lectures until the Government enlarges the classroom accommodation which is alleged to be altogether insufficient for present requirements.

**The London County Council** have decided:—“(a) That, in the absence of any undertaking from H.M. Commissioners of Woods and Forests to co-operate with the Council for securing, upon the expiration of the leases and at reasonable cost, the setting back of the buildings on the north side of Piccadilly, the widening of that thoroughfare to 80 feet between the Circus and Sackville Street be not undertaken by the Council; (b) that the foregoing decision be communicated to H.M. Commissioners of Woods and Forests and to the Council of the City of Westminster.”

**M. Emile Molinier** has resigned his appointment as conservator of the Objets d'Art Department at the Louvre and as member of the Commission on Historical Monuments. He has held the former post for the last nine years, having been attached to the Louvre for twenty-two years. He has published several valuable monographs and catalogues which are prized by experts.

**The Portsmouth Council** are about to make application to the Local Government Board for sanction to borrow 35,000*l*. for the erection of a new technical institute.

**The Town Council, Conway**, have decided to repair the Queen's Tower at Conway Castle as a memorial of the late Queen Victoria. The tower contains an “oriel” supposed to have been the private apartment of Queen Eleanor.

**Two Portraits** by David, which were painted in 1795, have been added to the collection of the Louvre. The subjects are his sister, Mme. Serizeat, and her husband. Although known as a painter of Greek and Roman scenes, David's best work is in portraiture.

**Mr. C. Y. O'Connor**, engineer-in-chief of Western Australia, has been found dead on the beach at Robb's Jetty, Fremantle. The harbour works at Fremantle were carried out by him. After filling many engineering posts in New Zealand, where he was Under-Secretary for Public Works from 1883 to 1890, he received the appointment of Engineer-in-Chief of Western Australia in 1891.

**Messrs. Farmer & Brindley** have executed twelve figures in alabaster, which have been placed in a large open arcade on either side of the reredos of Lichfield Cathedral.

**The Mikado's** presents to King Edward on the occasion of the Coronation include embroideries, lacquers, and notably a pair of silver vases 15 inches high and inlaid with gold representing seven years' work of thirty of the best Japanese artists.

**Mr. W. Dewey**, town clerk of Islington, has been elected president of the London Borough Officers' Association (an association consisting of the chief officers engaged in the metropolitan boroughs), in the place of Sir J. B. Monckton F.S.A., deceased.

**The Salon Exhibition** will be opened on May 1. The Ministers of Fine Arts and Finance have agreed to the proposals of the committee of the Society of French Artists relative to the refreshment rooms and other supplementary sources of income.

**A Committee** of the House of Lords have passed a Bill authorising the construction of a way across the Medway at Chatham to the Thames opposite East Tilbury for sailing barges. Ships in the canal would be propelled by electricity of the overhead trolley system.

**Eugène Alzein**, the French sculptor, died in Paris on the 5th inst. in his eighty-first year. The artist was a pupil of Ramey and of Daumont. His *Psyche* is in the Luxembourg Museum.

**The Housing Committee** of the London County Council ask the Council to approve the expenditure of 30,000*l*. on the purchase of a site about 50 acres in extent near Wormwood Scrubs prison, to be used for workmen's dwellings. The site is the property of the Ecclesiastical Commissioners. Under the prepared scheme of development accommodation would be provided for about 9,200 persons in 1,250 cottages of four different classes. According to the estimates of the cost of such a scheme it would appear that the cottages could be let at reasonable rents, and that with the outgoings at an average of 39*3*/<sub>8</sub> per cent, the net income would be sufficient to enable the Council to pay the price asked for the land and to comply with all financial requirements.

## EDITORIAL NOTICES.

of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our list of A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer the columns of this paper any questions relating to the complicated matters arising from the provisions of this Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

Authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

## TENDERS, ETC.

A great disappointment is frequently expressed at the non-observance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

## COMPETITIONS OPEN.

ALDERSHOT.—March 29.—Competitive plans are invited for proposed public offices, fire-station and town hall for the town. Premiums of £100, £75 and £50 will be awarded for the first, second and third best plans. Mr. Nelson F. Dennis, Surveyor, Aldershot.

TRIALIA.—May 1.—Designs are invited from sculptors for a memorial statue of Her late Majesty in marble or bronze. Information can be obtained at the office of the Agent-General for the State of Victoria, 15 Victoria Street, West.

DUNSTABLE.—A premium of 5*l.* 5*s.* is offered for the most design for a six-bed infectious diseases hospital. Mr. Benning, town clerk, Dunstable.

LANCASHIRE.—April 21.—Prizes of 20*l.* and 10*l.* respectively awarded for the first and second schemes in order of merit for utilising to the best advantage a plot of ground offered by the Council for the erection of about twenty-five new houses in Coleraine. Mr. William Henry, clerk, Coleraine.

LANCASHIRE.—April 4.—Competitive drawings are invited for a school to be erected at Langho, near Blackburn, for the education of the epileptics, imbeciles and idiots at present

in the workhouses of the Chorlton Union and the township of Manchester. Premiums of 200*l.*, 150*l.* and 100*l.* respectively will be awarded. Lithographed plan of site, and copy of conditions and instructions, may be obtained by a written application only, addressed to the Clerk to the Joint Asylum Committee, Chorlton Union Offices, All Saints, Manchester.

LIVERPOOL.—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

MANCHESTER.—The Chorlton and Manchester Joint Asylums Board invite designs for the proposed colony for epileptics and imbeciles. Premiums of 200*l.*, 150*l.* and 100*l.* respectively are offered. Mr. H. Woodhouse, clerk to the Board.

MEXBOROUGH.—May 1.—The committee of the Mexborough Montagu Hospital invite plans for the erection of an accident hospital for both sexes, for the treatment of thirty patients, with the needful nurses and servants' accommodation. Premiums of 25*l.* and 10*l.* are offered, the premium awarded to merge in the commission. Mr. C. Brumpton, secretary, Fern Villa, Mexborough, near Rotherham, Yorkshire.

NEW SOUTH WALES.—March 31.—Designs are invited for a bridge across Sydney Harbour. Mr. H. Copeland, 9 Victoria Street, S.W.

OLDHAM.—April 8.—Competitive drawings are invited for erection of new market hall and shops in Albion Street and Henshaw Street. Premiums will be awarded to the authors of the three selected designs, viz. 50*l.* for the design placed first, 30*l.* for the design placed second, and 20*l.* for the design placed third. Mr. S. A. Pickering, borough surveyor, Oldham.

## TRADE NOTES.

WE are asked to mention that the mosaic in the Corn Exchange now being erected in Manchester, under the supervision of Messrs. Potts, Son & Henning, was laid by Messrs. Diespeker & Co., of Holborn Viaduct.

THE Berkefeld Filter Company, Ltd., of 121 Oxford Street, W., who in the beginning of this year placed upon the market an improved germproof filtering cylinder, to which they have given the distinguishing name "Tubor," have been favoured with another contract from His Majesty's Government to supply filters for the use of the troops in South Africa.

A VERY large clock and chimes has just been erected in the tower, Beverley Minster. The chimes play upon ten bells in the north-west tower, and the hours are struck upon a new bell (Great John), which weighs 7 tons, in the south-west tower. The whole of the work has been carried out by John Smith & Sons, Midland Clock Works, Derby, to the designs of Lord Grimthorpe.

## VARIETIES.

THE Plumbers' Registration Bill has passed the Lords, and is now before the Commons.

THERE are fifty market crosses in the West Riding. That at Sharow has been handed over to the National Trust.

BRIGHOUSE Bridge, carrying the Huddersfield and Bradford main road over the Calder, is to be widened from 30 feet to 42 feet.

A NEW Wesleyan church and schools were opened at Sunderland on Wednesday afternoon. They are a portion of a scheme of extension on the part of the Wesleyan circuit, over which about 28,000*l.* is to be expended.

ON Saturday afternoon a new workmen's home at Craigneuk, Wishaw, was formally opened by Provost Stalker. The home has been erected by the Craigneuk Workmen's Homes Company, Ltd., at a cost of 5,000*l.*, and will give accommodation for 160 lodgers.

A NEW post office has been erected and formally opened in Buccleuch Street, Melrose, the contractors being Messrs. Herbertson, Galashiels. The building is a handsome and commodious one, consisting of the public office, a large sorting

hall with all the latest furnishings, and rooms for the graphists, postmaster, male and female clerks, postmen and messengers.

THE publishing and general offices of *Le Mois Scientifique et Industrielle* have been removed to 23 Boulevard des Capucines, Paris, the editorial department remaining, as before, at 33 Boulevard des Batignolles. This publication, many of our readers are doubtless aware, published distinguished scientific patronage, and appeals in an interesting fashion to engineers and manufacturers in general.

IN excavating at the extreme east end of Westminster Cathedral preparatory to carrying out a portion of the extensions, the workmen have discovered a section of the foundation of the original edifice, erected about the time of William the Conqueror. Near it, alongside what appeared to have been a limekiln, was a block of stone, forming part of the abacus of a Norman capital, with diaper carving, and in an excellent state of preservation.

ST. MARY'S R.C. church, Dundee, was formally opened on Sunday, after extensive alterations and the introduction of a new peal of bells. The church, which is one of the largest in Dundee, has been improved by the addition of a façade by a couple of fine towers, in which have been placed the new chimes. The interior has been redecorated in a tasteful style, and the improvements include the introduction of eight new windows, a mosaic floor in the sanctuary, a new marble altar and a new marble pulpit. The seating has been rearranged, and accommodation provided for 2,000 persons.

AT a meeting of the Edinburgh Architectural Association held at 117 George Street, Mr. J. A. Arnott occupied the chair in the absence, through indisposition, of Mr. J. Stewart, and a paper was read by Mr. George Whittet on "A View of the Architectural Features of its Colleges and other Buildings." A discussion followed. On Saturday afternoon some fifty members of the Association had an opportunity of inspecting the new gas works at Granton. On arrival the party, after having a general view of the huge undertaking from the bridge at the south corner of the site, were conducted over the entire works by Mr. W. R. Herring, the chief engineer, who suitably explained the leading features and purposes of the various building and machinery and its uses and generally the methods that had been adopted in gas production, &c., on the completion of the scheme.

Telephone 601 and 602 Avenue.

creation of Greater New York by the annexation of the boroughs of Bronx, Queen's and Richmond into existence a city somewhat comparable to Greater New York, so far as area and population are concerned. The area of Greater New York is 306 square miles, and the population may be taken in 1900 as 3,500,000; in 1900 it was 3,437,000. In 1900 the population of London was 4,803,000, but that of Greater London—the area of 688 square miles included within 15 miles from Charing Cross—cannot be much less than 6,000,000. Assuming the figures given above to be approximately accurate, the ratio of London population to that of New York is as 1 to .530, and the areas are as 1 to .467. On the assumption the density of population per square mile in London is 9,600, and that in New York is 11,470. New York is therefore more closely inhabited than London in the ratio of 1.20 to 1.

## BUILDING AND BUILDERS.

The North-Eastern Railway Company have decided to expend £100,000 on Hartlepool docks.

The West Pier at Whitby has been damaged by recent gales and repairs were ordered on Monday.

The foundation-stones of two new Board schools were laid on Monday by Canon Lambert and Councillor Milner respectively.

MAS MEHAN, bricklayer's labourer, fell from a scaffold while he was working at Middlesbrough on the 5th inst., fracturing his back. He died a few hours after in the Infirmary. Plans have been passed for a new church which is to be the Mission of the Good Shepherd, Small Heath, Birmingham, and the foundation-stone will be laid on the 22nd inst. The new building will be a large and handsome one, providing free accommodation for 1,000 worshippers, at a cost of £8,000.

At a meeting of the executive committee of the Swansea Harbour Trust on the 6th inst. a proposal was considered for improving the South Dock, which is being brought up-to-date. It is proposed to throw out a wall at a point near Pockett's Wharf to a point near the new dock which will have the effect of dockising the old dock and considerably enlarging the basin. It is calculated

that an additional 760 feet of wharfage will thus be obtained at a cost of £12,000.

THE picturesque old wooden bridge spanning the Thames, and connecting Pangbourne with Whitchurch, is in process of demolition, having been considered unsafe for some time past. Preparations are in progress for the erection of an iron structure by a Darlington firm. It is hoped that the new bridge may be completed about the end of the year.

THE Blackpool Corporation have now completed arrangements for commencing the huge work of widening the promenade. The contract for an extensive supply of basaltic stone from the Rhine quarries has been arranged, and word has been received at Fleetwood to prepare for the discharge of two large steamers from Rotterdam laden with nearly three thousand tons of stone, the vessels being expected early next week. Blackpool people may now reasonably anticipate that this long-deferred scheme will be pushed on and so provide work for those unemployed in the district.

AT Islington Dr. Danford Thomas held an inquest on Saturday on the body of Mr. Peter Murray, aged eighty, a retired builder, late of 8 Moranda Road, Upper Holloway. On Friday evening deceased left his home to attend early evening service at the chapel of St. Joseph's Retreat, Highgate Hill, and while in the attitude of prayer was found by a Mr. Marchant to be ill. Assistance was at once summoned, but death had ensued before the arrival of a doctor. Dr. E. Horsford said that the cause of death was syncope, and a verdict to that effect was returned.

THIRTY master and operative plumbers applying for registration under the National Registration of Plumbers attended at King's College on Saturday for examination by the Worshipful Company of Plumbers. The candidates were from various parts of London, and also from Dover, Eastbourne, Hailsham (Sussex), Ramsgate, Redhill, St. Albans, St. Leonards-on-Sea and Sutton (Surrey). The practical test included lead bossing and the making of plumbers' joints, &c. The examination questions included the subjects of contamination of drinking water from faulty connections, roof covering, arrangement of bath, sink and closet wastes, drainage of town houses, and disconnection with sewers. The examiners were Mr. Charles Hudson, master plumber, chairman of the board of examiners, Mr. J. Knight, master plumber, and Messrs. J. T. Martin and G. W. Stacey, representing the United Operative Plumbers' Association of Great Britain and Ireland.

Sixty per cent. of the masters and 40 per cent. of the operatives succeeded in passing the examination.

THE building surveyor for the Corporation of Liverpool reports that in 1901 the new houses built within the city of Liverpool were 1,963, an increase over 1900 of 390. It also exceeds the average of the past six years by 175. He states that "there is nothing specially remarkable in these figures, as they simply denote a natural increase of new houses." Of the total number only 316 were in the old city, and 277 of those were tenement houses built by the Corporation, each separate dwelling being counted as a house. West Derby heads the list of new houses with 584. There were 100 houses built with rentals of 35*l.* and upwards, 441 of 25*l.* to 35*l.*, 633 18*l.* to 25*l.*, 558 12*l.* to 18*l.* and 222 under 12*l.*, the last class being exclusively built by the Corporation for labourers' dwellings. During the year 461 dwelling-houses, 11 workshops, &c., and 6 manufactories, &c., were taken down.

REPRESENTATIONS having been made to the Bishop of Lincoln as to the need of extension and rearrangement of the ecclesiastical districts of Great Grimsby, his lordship appointed a commission of inquiry, including Earl Yarborough, Lord Heneage, Archdeacon Bond and other gentlemen to inquire into the spiritual needs of the borough, and the report of the commission shows that the population of the neighbourhood has increased in eighty years from 4,000 to more than 80,000. The commission recommends the formation of four new district parishes, the building of five new churches and the provision of six parsonage houses. It is pointed out that the effort will necessitate the creation of a new fund which should not be less than 70,000*l.* if the entire scheme is to be carried out.

MR R. H. BICKNELL held a Local Government Board inquiry recently into the application of the Middleton Corporation to borrow sums of 12,166*l.* and 23,100*l.* in respect of the sewage works and sewers. The town clerk stated that the first sum comprised amounts overspent on the sewers in the original scheme, and had to be spent in consequence of the bad nature of the land they came in contact with. The second amount was for extensions at the sewage works, and for the setting-up of new works for the treatment of the sewage at Birch, Bowlee and Slattocks. Mr. H. S. Batey, on behalf of Colonel Hopwood, owner of the Hopwood estate, opposed the last application on the grounds that all the sewage ought to go down to the main outfall works, and not to be treated as separate works. It would be exceedingly disagreeable, and

would have an effect on the building operations on the estate. The Corporation proposed to put the new works on the estate, but he was instructed to state that Colonel Hopwood would not sell them the land until he was compelled to. The inspector said the Board were certainly opposed to dual works, and was demonstrated to him that the sewage of these outfalls could at a reasonable cost be conveyed to the outfall works, and should certainly recommend the Board to refuse this application, but he had to hear the other side. The borough surveyor (Mr. W. Welburn) said the Corporation did not record the scheme propounded by Mr. Batey, because it was too expensive, and the town clerk said the additional cost would be 2,000*l.* The inspector said he would make a note of the objection, and the inquiry closed.

MR. S. W. WHEATON, M.D., an inspector of the Local Government Board, held a public inquiry at Hanley on the 6th inst. with respect to a proposal to amend the Hanley, Stoke and Fenton Joint Hospital Orders 1880 and 1896 to provide that the purposes of the joint hospital board should no longer include the provision of hospital accommodation for smallpox cases; and an application for the issue of a provisional order forming the boroughs of Hanley, Burntwood, Longton, Newcastle-under-Lyme and Stoke-on-Trent and the urban districts of Audley, Fenton, Kidsgrove, Leek and Stoke, and the rural districts of Cheadle, Newcastle-under-Lyme, Stoke-on-Trent and Wolstanton, into a united district for the purpose of the provision of hospital accommodation for the reception of cases of smallpox, and such provisional order also to provide for the constitution of a joint board, to be the governing body of the united district. Mr. A. Chubb, clerk to the Joint Hospital Board, in explaining the nature of the application, said it was that of fourteen local authorities whose districts embraced an area of 111,348 acres, with a population of 335,382. The proposal was to form a joint board representative of these authorities for the purpose of erecting and maintaining a smallpox hospital, upon a site at Burntwood purchased by the Hanley, Stoke and Fenton Joint Hospital Board. The site consisted of over seven acres of freehold land and cost 339*l.* 17*s.* 10*d.*, and would be let to the authority. Dr. G. Reid, county medical officer, supported the application, remarking that the scheme was an economic and efficient method of getting out of the difficulty. There was no opposition to the application. The Mayor of Hanley moved a vote of thanks to the inspector, and in seconding

expressed a hope that the provisional order would issued so that the work—the pressing work—of the hospital might be taken in hand. The inquiry ed.

### ELECTRIC NOTES.

Meeting of the Grimsby Corporation finance com-  
miserman Wright, chairman, explained that the Cor-  
would shortly require loans for 108,000*l.* in connection  
ic works, including 17,000*l.* for electric light extension.  
Bath City Council, sitting as an electric-lighting com-  
scussed at great length the recommendations made  
y the inquiry sub-committee as to the electric-lighting  
ng. They recommended an expenditure of 13,000*l.*  
he works in a condition to face next winter's load,  
l that they might be authorised to receive and con-  
tenders for the leasing or sale of the works which  
sent to them. After some discussion Mr. Isaacs  
amendment that the proposal to receive tenders be  
On a division the amendment was rejected, but only  
tes to 11, the attendance having dwindled. The  
also included three gas company shareholders, who at  
ot vote consequent upon a threat to bring the matter  
notice of the Local Government Board. The Clerk,  
ruled subsequently that they were entitled to vote,  
ree voted in favour of the reception of tenders. The  
s adopted.

EL DURNFORD, R.E., Local Government Board  
held an inquiry at the Southport town hall into an  
n by the Southport Corporation for sanction to  
2,000*l.* for the purposes of electric lighting. It was  
t the expenditure already made or contemplated was  
e necessary, in view of the growth of the demand for  
ht and power. Of the sum applied for 9,000*l.* had  
ally spent on condensing plant, pumps, the erection

of a transformer, the strengthening of the foundations of  
the boiler and engine-house, a sub-station in London  
Square, and in connecting up with customers along  
the route of the distributing mains over and above  
the amounts previously estimated for and sanctioned by  
the Local Government Board. It had been found that the  
high tension cables from the works at Crowlands to the town  
had been overloaded, and to the six cables already laid they  
proposed to add four more at a cost of 5,880*l.* Of the remain-  
ing items the chief were 1,000*l.* for a new sub-station, and  
12,000*l.* for a two years' supply of meters, cut-outs, service and  
joints and distributing mains, with 2,090*l.* for contingencies.  
There was a prospective demand for power to work the pier  
tramway, additional lines of street tramways and the lighting  
of the L. and Y. Railway Company's station at Chapel Street.  
There was no opposition.

### G. & T. EARLE, LTD.

WE are reminded by the receipt of a handsomely printed and  
illustrated brochure on the standard methods of testing  
cement adopted by Messrs. G. & T. Earle, Ltd., cement  
manufacturers, of Hull, that the firm was established as long  
ago as in 1811, and that at present the fourth generation of  
the family are engaged in the manufacture of the cement on  
the excellence of which it has built up its reputation, an  
excellence which it is as much the aim of the present represen-  
tatives of the firm as it was of their predecessors to maintain  
at all costs. Messrs. Earle & Co. are also manufacturers of  
an odourless cement paint, which they are offering under the  
name of "Nonex," for which they claim that it preserves  
artistically iron, corrugated iron, brick walls (renders damp-  
proof by sealing all perforations), cement, plastering, stones,  
slates, tiles, &c. It is supplied in the following colours:—  
Slate, cement, slate blue, dark terra-cotta, green, dark blue,  
light marone, light brick red, cold-grey slate, yellow, light  
blue, black, &c., and will stand washing without rubbing off.

## A LADY CONTRACTOR.

FOR the first time in his life David Doak, a contractor of Philadelphia, wishes he was a woman. Mr. Doak, says the *Baltimore Architects' Journal*, began to realise the advantages of belonging to the opposite sex when Mrs. Hugh Brady got the job of clearing out the debris after the Hunt-Wilkinson fire away from him, and he had to content himself with obtaining the contract to pull down the walls.

In the beginning Mr. Doak watched from afar with resentful, sceptical eyes as he saw a woman in a golf cape arrive with six men and dump-carts. "But say," said Mr. Doak in tones of unqualified admiration; "she's all right. She knows her business. While she was at the building I had to go away back and sit down. Nobody looked at me, nobody listened to me. My own men wouldn't pay any attention to me. She was the whole thing. They came from the papers and wanted to take her picture, but she wouldn't have it. I said 'Take me,' but nit. They told me to go away before I cracked their lenses. The reporters wanted to interview her, and she wouldn't have that either. I told them I would talk, but they said they didn't want to hear me. Is she smart? You bet she is. She makes me feel like thirty cents. Is she young? Is she good-looking? She's everything I am not," said Mr. Doak humbly. "She can get her men to fill the carts by giving them one good sharp look. I couldn't get them to do it with a club. I used to pity women just on principle; but never again," he said, "never again. I envy 'em." And he started after a man who put three shovelful of dirt in his cart and called it a load.

Mrs. Hugh Brady is the only woman contractor in Philadelphia. She kept on with her husband's business when he died. She has made a success of it, and is known as a shrewd business woman. She takes contracts to haul ashes, clear away the debris after fires, or anything, in fact, that other contractors in the same line of work are in the habit of doing.

## ELECTRIC LIGHTING OF NEWCASTLE, STAFFS.

A LOCAL GOVERNMENT BOARD inquiry was held at the Town Hall, Newcastle, Staffs, on the 4th inst., by Mr. A. A. G. Malet, M.Inst.C.E., respecting an application by the Corporation for sanction to the borrowing of 8,615*l.* for purposes of

electric lighting. Mr. S. Watson (solicitor) represented the Corporation, together with the assistant town-clerk, Mr. Bentley, and Mr. S. V. Clirehugh (Messrs. Lacey, Clirehugh & Sillar, London and Manchester), electrical engineer and author of the scheme. There were also present Mr. R. B. Mellard (ex-mayor) and T. P. Heath, Councillor, Elliott (chairman of the electric-lighting committee), T. H. Nicholls (borough treasurer), R. Fenton (accountant), &c. Evidence was given of the population, the value and outstanding loans of the borough, and witnesses testified to the demand for electric light. It was stated that since the provisional order was obtained a considerable amount of business had been made to the Corporation for the supply by the principal tradesmen in the compulsory area, which consisted of Brook Lane, Penkhull Street, High Street, R. Square, Bridge Street, Ironmarket, Nelson Square and R. Street. Mr. Clirehugh described the scheme. It was proposed to put down two 100 horse-power gas-engines, which would drive two 60-kilowatt dynamos, by means of coupling direct. It was considered reasonable to assume that within a very short time after the opening of the works there would be 4,000 eight candle-power lamps connected to the system. One of the proposed dynamos would supply this demand to insure continuity of the supply in case of breakdown, the other necessary to provide duplicate plant. The Corporation proposed to supply gas from the gasworks at 2*s.* 6*d.* per therm, which was rather a high price for gas for power purposes, as he supposed 150*l.* of that at least would be clear profit. He hoped the Corporation would see fit to reduce that price later. The proposed site of the works was land adjoining the gasworks and in the possession of the Corporation, for which they had no other use. A battery of accumulators would be supplied sufficient to maintain 350 8 c-p. lamps for eight hours. Then there would be the other necessary machinery for suitable buildings. The system proposed was the three-phase system at pressure of 440 volts, giving a supply to the Corporation for electrical lighting purposes of 220 volts and for other purposes 440 volts. The estimates only allowed for the cost of the mains in the compulsory area. The whole system was designed so that, without wasting any work or expenditure, the mains could be extended over the rest of the area of the borough. The feeders were of sufficient capacity to carry any reasonable demand, and branched off in any directions. But the committee did not anticipate that there would be any demand for extension beyond the compulsory area.

## THE UNION PLATE GLASS CO., LTD., POCKET NOOK, ST. H.

Telegrams, "Union, St. Helens." Nat. Tel. 48.

ESTABLISHED 1837.

Interior Lighted by ordinary Plate Glass.

Makers of Ground, Smoothed, Polished, Silvered, Bevelled, Brilliant Cut, and Bent Plate Glass; Rough Rolled and Rough Cast Plate Glass; also of Rough and Polished Prismatic Glass, &c., &c.

Contractors to His Majesty's Office of Works, War Office, and Admiralty

at least for some years. In a small station the costs necessarily high, and it was very desirable to make the expenditure as low as possible. The estimate was as follows:—Two 100 h.p. gas-engines, 1,200*l*.; two 60 k.w. belt-dynamos, 600*l*.; belting, water-vessels, pipe connections, 50*l*.; balancing transformer and booster, 300*l*.; switch-boards and connections, 300*l*.; accumulators, 775*l*.; travelling-cars, 50*l*.; buildings, &c., 2,000*l*.; underground mains, 1,980*l*.; 605*l*. It was necessary to add 10 per cent. for contingencies, fees, &c., and one or two other small items made the estimated cost 8,615*l*. The interest and sinking fund amounted to absorb 544*l* and the working costs to amount to making a total expenditure of 1,381*l*. The revenue from 8 c.-p. lamps, each consuming 15 units per annum (was a low estimate) at 6*d*. a unit (which was equivalent to 3*s*. 6*d*. per 1,000) amounted to 1,500*l*. a year, showing a surplus of 119*l*. No provision was made for street lighting, as no opposition to the scheme. Thanks were accorded to the committee at the close of the inquiry.

## ST. LOUIS EXHIBITION.

The world's Fair planned to be held at St. Louis next year is now officially as the Louisiana Purchase Exposition. To celebrate the centennial of the acquisition from France by Jefferson of the territory of Louisiana, out of which have been made the twelve States of Missouri, Arkansas, Illinois, Minnesota, Kansas, Nebraska, Louisiana, Colorado, Montana, North Dakota, South Dakota, and the Territory of Oklahoma. The area included was 14,000 square miles, and the price paid was 15,000,000 dols. The population of the States at the census of 1900 was 14,000,000, the taxable value of property was 6,616,642,829 dols., and the annual value of all the products was about 10,000,000 dols. The actual work of construction is progressing rapidly even during the winter months, as St. Louis, on account of its mild climate, lends itself to this. The plans for the principal buildings have been accepted and many have been let. The Fair authorities have decided to occupy the new grounds of Washington Park, comprising 110 acres, which connect with the Forest Park. Upon these important grounds are either finished or in course of erection. With this location the site chosen will cover over 1,000 acres.

It is easy of access, the various street railway systems, of which the city has about 500 miles, converging at the different gates and entrances; all the twenty-four railways entering St. Louis will be connected directly with the site, while electric lines will be constructed to carry passengers from one department to another within the grounds. Of the invitations extended to foreign countries twelve or fifteen have been accepted, of which Japan and France are the principal. The exhibits of each nation will be preserved in their entirety, and not scattered according to their classifications. While the exposition will be both national and international, it will also illustrate, as completely as possible, the history and resources of the States and territories made from the Purchase. The Fair is to be held under the auspices of the Louisiana Purchase Exposition Company, whose management is confided to ninety-three directors—the leading business and professional men of St. Louis—its president being the Hon. David R. Francis, formerly Governor of Missouri and Secretary of the Interior in the Cabinet of President Cleveland.

## THE HOUSING QUESTION.

THE "rehousing of the people" will, it is quite clear, soon become a question of practical politics, says a writer in the *Spectator*, and as no one disputes the existence of overcrowding or its injurious effects upon morality, health and happiness, the subject of dispute is narrowed down to the methods of providing a remedy. There are just three which are possible, and until we have settled which of the three we intend to adopt, all arguments, proposals and speeches must remain more or less sterile. We must, whether we like it or not, either leave the matter to private enterprise, or compel the municipalities to supply gaps out of the rates, or assist builders from public funds to erect the necessary and wanting rooms. If we should talk ourselves deaf we shall find no other plans, and it is round them that the battle in Parliament and in the constituencies must necessarily rage. We will try, therefore, to state very briefly their inevitable recommendations and objections.

1. There can be no doubt that private enterprise in building houses and flats is preferable to any other plan if it will only work. The private builder knows where houses or rooms are wanted, he knows the kind of house or flat that will be in demand, and he can meet individual or class requirements

without dislocating his machinery. His resources are limitless while profit is in sight, and he need waste no time over argument, but can set to work six hours after he "sees his way." It is a lighter argument, but still a strong one, that he, and he only, of all potential rebuilders, is in accordance with our habits, will not derange industry or wages, and will not out of his work acquire political power. The conservative builder may become a great man, but so will the radical builder, and they neutralise one another. Unfortunately, private enterprise fails to do the work. The builder does not "see" before him the profit which is his impelling power. Just at the moment when, owing to the increase of population—which is of course the ultimate root of the whole matter—the need for houses and rooms has increased to the point when men get angry, the wages of the building trade have risen, the cost of materials has risen, and the demands of a healthily fastidious opinion have risen till, though rooms can be provided by the million, they cannot be provided cheap. Even the skilled workmen are embarrassed by the rents required to give the builder a stimulating profit, and the unskilled workmen, speaking broadly, cannot pay them, and are forced to crowd together in a way which modern civilisation, whether sanitary or moral, wishes to forbid. We need not go into figures, and so bring on ourselves shoals of letters, because we can bring the broad fact home to our readers in an easier way. When, seventy years ago, the Reform Bill was drawn up, the governing power of the country was vested in the 10*l.* householder. He was considered, and he was, a humble aristocrat, a respectable person with a stake in the country and a reason for being orderly. Ten pounds a year, however, is less than 4*s.* a week, and where is the builder who in the country, if there are no exceptional circumstances to help him, will supply and keep in repair a good sound cottage of four rooms, or in London three rooms in a flat, to be let at that rate? He asks 6*s.* at least, more usually 7*s.* for the cottage, and in London at lowest 3*s.* a room, and the poor, by which word in this article we mean the men earning less than 1*l.* a week, cannot, if married, pay it. They must either crowd into smaller tenements or take lodgers, in either case producing the very evil which all reformers want to avoid. The skilled workman has met the difficulty by paying about twice as much in proportion to his income as the professional or the business man does; but the unskilled workman is powerless, and very apt to regard too much interference on the subject as an oppression. Parliament cannot alter this state of things—cannot, that is, compel the builder to build

without profit, or fix the price of bricks, or order mass content with lower wages. Something may be done in the country, as we have always argued, by allowing wood; but that device would possibly send up the durable timber, which is limited in quantity, and in case, of no use in great towns. Our hope in private enterprise at any rate in the towns, unless, indeed, the population is very limited.

2. We come, therefore, to rates—the "municipal house-building" in which so many people fanatically believe, but the hope there is not vivid. The plan does not work in the country case at all, and in great towns the burden is too heavy. If the town councils take on the work, they must do the whole work, for private builders cannot and cannot compete with them, and the whole of the full needs of the existing population, and the growing population, will, we fear, prove too heavy. They will never build as cheaply as the builders—it is the nature of things, for their workmen are voters, will be robbed in contracts—and if the builders cannot profit, how can their fettered rivals? They will, we lose money to such an extent that the ratepayers, who are no means as humanitarian as writers in the *Daily News*, either rebel and refuse to continue the undertaking, or rents so increased by rates that they will be forced to join the ranks of the overcrowded. This means an imaginary danger. We venture to say that if the London County Council, instead of trying petty experiments—petty, we mean, in proportion to the necessity—take the whole work earnestly in hand, it would in twenty years be abolished as an intolerable burden on the prosperous great city. Its better rooms would attract new workmen from the country, its worse rooms would not. The total result would not improbably be a vast debt, but all other forms of progress, and a system of crowding, less injurious because it would be partially concealed.

3. It is quite possible, though no one will admit it, that the problem is insoluble, and that one condition of the ancient and of all Oriental city civilisation is crowding; but we think there is hope in the thing. This is to extend the provisions of the existing Act for the promotion of cottage building so that private builders under prudent and carefully considered conditions of contract from the Treasury at, say, 2½ per cent., repayable in full

## SAFE KEEPING OF SECURITIES. SAFE KEEPING OF PLATE, JEWELS, BONDS

The CHANCERY LANE SAFE DEPOSIT (entrance at 61-62 Chancery Lane) PROVIDES MASS PLACING IN ABSOLUTE SAFETY UNDER THE DEPOSITOR'S OWN CONTROL, AND OPEN INSPECTION, ALL KINDS OF SECURITIES, BONDS, DEEDS, PLATE, JEWELS, MANUSCRIPTS, VALUABLES OF EVERY DESCRIPTION.

re an incurable belief in private energy when urged by  
tion of profit, and one great obstacle in the builder's  
the rate he is compelled to pay for capital. The mere  
y that he could get it upon fixed and known conditions  
empt him into enterprise, and there is much more result  
terprise than from civic benevolence. It would greatly  
cause if eviction for non-payment of rent were made  
as it is in France, and if "fitting" were regarded as a  
offence; but it is quite useless in the present state of  
to press for any change of the kind. The public will  
eve as Miss Octavia Hill, for instance, does, that an  
le rent is more readily paid than one casually  
nd to argue with the uninstructed conscience when its  
ce seems benevolence is a hopeless waste of time. But  
ne to believe that cheap capital employed by private  
ight solve the problem without driving private enter-  
of the market, and without placing an army of opera-  
the disposal of the majority in any town council. At  
its, the experiment could be tried without either the  
the municipality incurring indefinite pecuniary risks,  
ning landlord of masses of tenants who if aggrieved can  
ut of power. To give to tenants the right to dismiss  
adlord does not seem to us to tend towards either  
tual payment of rent or zeal in the erection of new

hall on the west, and also from the first floor of that part of the  
older building which contains the senate room. There remains  
one more entrance, namely, that under the wide and con-  
spicuous archway which serves to link the new buildings to the  
tower block. This archway will in itself constitute a great  
boon to the College, for the present entrance to the quadrangle,  
which is situated under the tower, is, to say the least, inade-  
quate, and is not without its dangers when used for vehicular  
traffic. From the new archway access is gained into the old  
building on the right, and on the left into the entrance-hall of  
the new building, from which a wide corridor leads to the  
staircase hall at the south end. On either side of this corridor  
are ranged a group of rooms, which occupy the whole of the  
ground-floor of the building. These rooms are intended for  
various purposes. Some of them will be set apart for examina-  
tion purposes, while others will be allotted to the University  
authorities as offices. There are also a large kitchen and  
service-rooms to be used when dinners are given in the large  
hall above. The staircase hall is a feature of some architectural  
interest. The stairs themselves, which ascend to right and  
left, are screened from the hall by an arcade, and there are also  
arches which cut off the public entrance at the east and west  
ends of the hall. Ascending the stairs, one comes first to the  
general level of the floor of the hall, from which a good view  
is obtained of the proportions of the whole room. It is 50 feet  
wide and 60 feet high from the floor to the apex. The length  
is about 130 feet, but the whole of this is not visible, for the  
north end wall is partly concealed by platform and galleries  
and by the central and crowning feature—the front of the noble  
organ.

### OWENS COLLEGE, MANCHESTER.

nce and Princess of Wales were accorded an enthu-  
selcome in Manchester on Wednesday, when they paid  
to Cottonopolis, for the purpose of opening the new  
rth Hall at Owens College, which latter, by the way,  
ed its jubilee on the same day. This celebration  
however, but for the national mourning, have taken  
elve months earlier, the College, which was founded by  
wens, having been opened to students on March 12,  
for the following description of the new building we  
bted to the *Manchester Guardian* :—

hall stands at the angle formed by the junction of  
Street and Burlington Street, and, together with the  
Library, occupies the south-east corner of the College  
ple. The means of access and egress are especially  
ious. Not only are there street entrances for the  
Oxford Road and Burlington Street, but there are  
approach from the Christie Library, which adjoins the

This organ, which, as was recently announced, is the gift  
of Mrs. Rylands, is one of the masterpieces of Messrs. Willis  
& Sons, and deserves a few words of description. The case is  
of oak, in Gothic design, and the front pipes are burnished  
metal. The organ has four complete manuals, with a manual  
compass from C C to C—61 notes. The pedals are from C C  
to G—32 notes. The great organ has twelve registers, the  
swell thirteen, the choir ten, the solo eight, the pedal ten, and  
there are eleven couplers and accessories. The organ is  
controlled by twenty pneumatic pistons, and five composition  
pedals. None of these, however, are in at present. The whole  
action is tubular pneumatic, and the solo organ is enclosed in  
a box like the swell, being therefore expressive. There are  
fifty-three speaking registers. Of these, two are of 32-feet  
calibre, and 2,339 pipes. There are considerable variations of

wind-pressures from the different registers. The organ, of course, is far from being complete, but at the request of the College authorities Dr. Kendrick Pyne consented to play on Wednesday and Thursday.

Perhaps the most noteworthy feature of the hall is the roof, which is of a particularly rich description. The visible portions are entirely of oak, and the principals, which are a modification of the well-known "hammer-beam" construction, are in the form of large pointed arches. Their lower extremities rest at each end upon granite columns, which seem, as it were, to carry the roof from the floor. Between the columns come the windows, the hall being lighted on both sides. The side windows, like the great window at the south end, are filled with coloured glass. In the case of the south window the interest is increased by the insertion of a number of coats-of-arms, among them being those of the University, the College, the county and the city. Many of the benefactors of the College are commemorated in the same way. In prominent positions are the arms of John Owens, the founder of the College; his friend George Faulkner, who is said to have persuaded Owens to leave his money for the foundation of the College rather than to bestow it upon himself; the Duke of Devonshire, Mr. C. F. Beyer, Sir Joseph Whitworth, Mr. R. C. Christie, Mr. Thomas Ashton, and the families of Fielden and Rylands. For illumination at night the hall has been provided with pendant electroliers, two of which hang from each of the roof principals. The seating accommodation is not on the floor space alone. There are raised stages at the south end, which are accessible from the staircase, and at the higher level the staircase also leads to various galleries.

The Whitworth Hall, like most of the College buildings, has been designed by Mr. Alfred Waterhouse, R.A., and the external material is a stone similar to that used elsewhere at the College. The style, though in some parts richer than that of the adjoining buildings, is for the most part of the same character. To give special point to the design two towers have been introduced at the south end, flanking the great gable which contains the traceried window; but in order that these should not vie unpleasantly with the tall tower—so familiar a feature of the College—they have been kept down to a considerably lower height, being, in fact, only 100 feet high from the pavement. The street front is pleasantly broken up by the buttresses, which counteract the thrust of the roof, and is further diversified at the south end by the public entrance and

at the north end by the carriage archway already mentioned. The roof over the archway, being lower than the general level of the hall, serves to dissociate the new buildings from the old ones and to prevent an undue sense of crowding which have been produced if the hall had closely adjoined the old buildings.

The foundations of the new building were commenced in February 1898. Its cost is about 50,000/.

### THE AUCTIONEERS' INSTITUTE.

At the fourth sessional meeting of the Auctioneers' Institute of the United Kingdom, held on the 5th inst. at the Medical Examination Hall, Victoria Embankment, Bennett Rogers, the president, being in the chair, Mr. Soper, barrister-at-law, read a paper on "The Liabilities of Landlord and Tenant for Improvements under the Sanitary Acts." He said the subject was one which should be taken into consideration in every contract of letting for a term of years, and the Law Commission showed how the question raised might be a source of friction and a source of difficulty if not properly provided for in the contract of tenancy. He summarised the law as it was possessed by local authorities to compel the execution of improvements in private property, and quoted a number of cases with a view to show that in certain circumstances a tenant had been held liable under covenant for carrying out the requirements of the local authority. He mentioned other leading cases which were decided in favour of the tenant, and said that if the covenant were to pay all charges upon the landlord, it would be sufficient to rid him of the burden, but if it were to pay charges imposed upon the premises it would not be sufficient, as these duties under the Sanitary Acts were imposed upon the landlord personally, and not upon the premises. It would save much confusion to the law if the covenant to include all charges payable by the owner under the Public Health and any other Sanitary Acts for the time being in force and applicable to the premises suggested rules and principles which might be of service in the property, which were not apparent to the tenant at the commencement of the holding, the cost of remedying the property, in common fairness, to fall upon the landlord; on the other hand, they were caused by neglect or mismanagement of property on the part of the tenant, he should be the person

the expense of putting things right again. The landlord not to escape, through the ingenuity of the draughtsman prepared the lease, from burdens which he should in no way bear, and, on the other hand, the tenant ought not to be troubled through any faulty wording of his covenants when it was his intention that he should bear these expenses.

## DEVELOPMENT OF EASTBOURNE.

DEVELOPMENT of much importance to the future of Eastbourne has just been commenced, says the *Sussex Daily News*, the opening-up of the Ratton Park Estate for building purposes. The undertaking may, in fact, be regarded as the commencement of a new epoch in the history of the town, for it will this development afford opportunities for the building of many moderate-sized private houses, of a type in great demand, but it will add much to the attractiveness of Eastbourne's surroundings. By next May one reproach to Eastbourne will have been removed by the completion of a new low-level drive to Hampden Park and thence to the sea. With the exception of the Duke's Drive to the Head, there are at present only two ways out of the town over Ocklynge Hill, the summit of which is no fewer than 100 feet above high-water mark—a narrow and inconvenient road—while the other is that rather dreary way out by the Downs to Pevensey. Hemmed in as Eastbourne is on the north-west, occupied mainly by the estate of Mr. F. G. Cooke, M.P. This estate has lately been laid out by F. G. Cooke, A.M.I.C.E., architect, of Eastbourne, and it makes it quite clear that a development of the highest importance is imminent.

It has been written about Hampden Park and its surroundings, but it is the intention of this article to deal with the general laying out of the estate. The part now being developed mainly lies between Hampden Park and the Downs, running from the south up to Old Eastbourne. A glance at the map shows that nearly all the roads being constructed, and to be constructed, radiate at various points from the low-level drive, much as the branches of a tree radiate from its trunk. It all appears to be designed with due regard to the convenience of the public, as well as to the advantage of the estate. This bold scheme is rendered the more easy by the

happy fact that there are no varying ownerships in the way, and therefore no conflicting interests to study, as happens so often in the vicinity of many towns. The width of the low-level drive until it reaches the Ratton estate boundary will be 50 feet over all, in itself a very broad drive; but on reaching this point it will be at once widened out to about 100 feet over all, with turf and trees on either side. Nearly all the other roads are to be similar, and as they will eventually extend for several miles, the effect cannot fail to be pleasant to a degree. In many cases where roads meet there are to be wide open spaces treated as commons, three and four acres in extent, all dealt with in such a way as to make rapid transit at junctions of roads easy and safe, so that the motorist and the cyclist alike, both now and in the future, will have nothing to complain of. In fact, there are few localities where their interests have been so carefully studied.

This, of course, has been done strictly with an eye to business, for it is now universally recognised that the motor-car, more especially, has come to stay, and that the locality that caters best for the comfort of those who use these rapid-running vehicles will surely in the long run benefit most. There is hardly a straight road on the estate, nearly all being laid out in flowing curves and with easy gradients. As opportunity offers, the existing Willingdon Road will be widened, and the picturesque old village will soon have two broad new approaches, one close to the church and the other at the east end near Hydney House, converting Church Street, now practically a *cul de sac*, into a pleasant thoroughfare. While all the new roads will be planted on either side with trees, it is not intended to put them too close, nor to have them just at the junction of roads. It is quite possible to have too many trees, beautiful as they are; indeed, complaints are now made in Eastbourne that the trees are too thick in several of the roads.

Mr. Cooke, who has specially visited many of the best health-resorts in Germany, Italy, France, Belgium, Denmark, and in this country has made a special study of tree-planting in towns, and considers that the heedless crowding of roads with tall forest trees is a mistake, both from picturesque and hygienic points of view. He lays it down that roads with houses on either side should only be sparsely planted with trees. There is a happy medium in all things. Houses should be surrounded with glowing light, brilliant sunshine and general dryness, and this is not possible where tall trees exist close by, unduly obstructing the free passage of light and air. So the Ratton estate is to have trees enough, but not in such numbers

as to detract from the brightness and dryness of the residences, and the "open spaces" are to be numerous and attractive. To begin with, there are the grounds attached to Mr. Freeman-Thomas's mansion-house, which bulk largely on the plan; then there is Hampden Park, some 82 acres in extent, including 50 acres of wood, and adjoining which there is to be a recreation-ground some 20 acres in area, in addition, bringing the open spaces of the Park practically right up to the Willingdon station. At intervals more or less all over the estate there will be playing fields for the use of such private schools as may be built on the estate, and last but not least, close under the Downs, there is the wide undulating space now occupied by the Willingdon Golf Links. At present there are only nine holes to the course, but space has been allotted for its extension at an early date into a complete eighteen-hole course. The present links are succeeding admirably, and form no mean attraction, not only to the Ratton estate, but to Eastbourne itself, for it is well known that the existing Eastbourne links are crowded, especially in the season, and that there is plenty of room for another full course. Willingdon links lately have been greatly improved. There is a scheme now on foot to erect a new club house on the latest model, quite close to the Victoria drive and of easy access from the new low-level drive. From the foregoing it will be seen that no efforts have been spared to make the Ratton estate not only a charming place in itself, but worthy of its close proximity to Eastbourne.

By a fortunate geological accident the estate stands in the main on chalk and high ground, and to show this last more clearly the levels above high-water mark are figured liberally all over the plan. These levels range from about 8 feet near Willingdon station to 221 above high-water mark, and even higher. The average height of the low-level drive is about 40 feet above high-water mark, and that of Hampden Park about 25 feet; in fact, the highest ground anywhere in the vicinity is in this favoured estate. Willingdon Hill, which towers over the village, is nearly 100 feet higher than Beachy Head itself, so that those who may desire to perch themselves on high ground will have plenty of opportunity of so doing. The views to be obtained are magnificent, especially from the Willingdon links and around them. From here one may see that glorious stretch of country ranging from Crowborough past Heathfield to Battle and Hastings, Herstmonceux and Pevensey in the nearer foreground, and, far-spreading to the right, the broad expanse of the English Channel, all forming a

magnificent panoramic view which the greatest British landscape painter, J. M. W. Turner, thought not unworthy his attention, for did he not sketch the Vale of Hailsham including in his sketch Willingdon Hill and all the surrounding country, even showing Eastbourne as it was then dominated by Martello towers on the beach, with the sea beyond. The estate has its own special drainage system, designed by late Mr. G. A. Wallis, C.E., shortly to be extended to meet requirements; and, if need be, at any time in the future the drainage can be taken into the Eastbourne main sewer, the water-mains from the Eastbourne Waterworks extending through the estate, and the electric-light main nearly to the village. The telephone is also available, so it will be seen that the estate is up-to-date in every respect.

A good deal of land has lately changed hands, and a large number of houses are already being erected. It is intended that practically all houses shall be detached, standing on large plots of land. No slate roofs will be permitted, and no stucco frontages. Slightly brick boundary walls are discouraged. Similar conditions to those obtaining on the adjoining estates are to be enforced, so as to insure the whole estate being of a homogeneous nature. Provision has, of course, been made for cottages, but in no case will rows of unsightly dwellings be allowed. Groups of cottages on the model-village system are intended, at once more healthy and pleasant to the eye than the massing of blocks of houses jammed into small areas. Land will be let on long leases, with option of taking the freehold at any time within ten years of the date of the lease. A peppercorn rent only is required for the first five years of the term; in short, the terms are the same liberal ones which apply to the adjoining estates. All plans and elevations are to be submitted to the agent to the estate, but they must meet with the approval of the agent to the estate, but they may, or purchasers may, of course, employ their own architects. Eastbourne largely owes its present high prosperity to the fact that, in the past, as in the present, to the restrictions imposed on the two large estates on which it stands, and to the fact that example will be followed and in some respects improved. Mr. F. G. Cooke, agent to the estate, was concerned for many years under Mr. G. A. Wallis, C.E., in the development of the Duke of Devonshire's estate in Eastbourne, so his training and local knowledge ought to stand him in good stead in the responsible position as agent to a great estate which requires good management to prove a model of its kind. The solicitors to the estate are Messrs. Hunt, Currey & Noyes, of Lewes.

## THE WEEK.

several years Mr. NICHOLAS CHEVALIER, who died on day, was a welcome visitor in English studios. As he travelled round the world and was acquainted not only many countries and cities, but with the men, councils and governments who lived in them, his conversation was as entertaining. He was an artist himself, but as the arts he chose were generally views in distant lands he was not to be looked upon as a rival. Then he was the representative of the Sydney authorities for the purchase of pictures, and that office increased the welcome which he received. Owing to his good judgment the Sydney authorities possess sufficient works to enable a visitor to appreciate the varieties of modern English painting. Although naturalised in England, Mr. CHEVALIER was a Frenchman by birth. After his training in Munich and Rome he emigrated to Australia. He was connected with the colonial illustrated paper, and with various other enterprises. Then he went to New Zealand, where he found an abundance of subjects for representation. He accompanied the late Duke of EDINBURGH in his tour round the world, and produced 130 water-colours as a record. He settled in London in 1870 at Porchester Terrace, Park, and during the next twenty years produced a large amount of work, both in oil and water-colour, exhibited regularly at the Royal Academy. Her late Majesty sent him to St. Petersburg to paint the marriage ceremony of the Duke of EDINBURGH.

The new National Physical Laboratory, for which the House has been utilised, can render aid not only to science but also to industrialism in various forms. But the State must make a larger allowance for its upkeep than for a year. Not one of the public laboratories on the Continent or in America is kept going for so small a sum. It is no doubt that manufacturers have been able at a low cost to supply the place of such establishments. Wrought-iron, without receiving a penny from the country, has been used by EDWIN HODGKINSON for years to conduct experiments into the strength of cast-iron beams and rivets, and the results have been accepted throughout the world. The North-Western Railway Company were enabled to establish conclusions for wrought-iron rivets were no less important. Nor is it to be supposed that any official establishment will accomplish more worthy work than that of WHITWORTH and several other Manchester firms. What the new laboratory can do, however, will be as an intermediary between official scientists and men who can claim to be specialists. There is, for example, a great many edicts of the Board of Trade which add enormously to the expense of engineering works in any way increasing their strength and efficiency. It might go so far as to say they have a reverse effect, for an excess of steel is employed in a bridge, it may add to the strains by the extra weight. It is to be hoped, however, that the officials of the new laboratory will be communicative about their discoveries. They should understand that their investigations are intended for the benefit and are not to be entombed in the proceedings of societies for the edification of a few students and foreign institutions. Unless care is taken, it will be necessary to seek in French and German periodicals for information which would be deemed vulgarised if it were placed in the first place to the English public.

JUDGMENT was given on Saturday by Mr. Justice KILL in HOWARTH v. GARDNER. The action was brought by Mr. HERBERT HOWARTH, architect, of Morecambe, against the proprietors of the Alhambra Palace in order to recover 379 $\frac{1}{2}$ l. balance due to him for fees in connection with the building. The defendants denied their liability, and counterclaimed damages for alleged negligence. From the evidence which was given when the case was tried at the Lancaster Assizes it appeared that in the year of 1899 the defendants acquired the West End

Market at Morecambe for the purpose of erecting a music-hall above a market. In the course of the erection various alterations were made, and the building, when completed, was a theatre instead of a music-hall. The total cost of the building was 25,779 $\frac{1}{2}$ l., including 1,579 $\frac{1}{2}$ l. for electric plant, 1,050 $\frac{1}{2}$ l. for furniture, &c., and 2,585 $\frac{1}{2}$ l. odd for plastic decorations. Mr. Justice BUCKNILL deferred judgment. On Saturday his Lordship said that having carefully considered the evidence given at the trial he had come to the conclusion that the plaintiff was entitled to receive from the defendants 1,312 $\frac{1}{2}$ l., less 1,160 $\frac{1}{2}$ l., which had been paid on account. He also was of opinion that the defendants had failed on their counterclaim, and therefore he gave judgment for the plaintiff on the claims for 152 $\frac{1}{2}$ l., and also on the counterclaim with costs.

THE rating of machinery is one of those subjects which, on account of their vagueness, cause much annoyance between local authorities and factory owners. The fact is, although there is hesitation in stating it, machinery is not rated by itself. In a legal sense it is considered to resemble sculptured chimneypieces, inlaid doors and other important fixtures which increase the value of a building. If there was a clear understanding in manufacturing towns on the question there would be much less heartburning and less waste of money on litigation than at present. A case which was heard in the King's Bench Division on Tuesday reveals the uncertainty which prevails. A boot manufactory in Northampton was rated at 825 $\frac{1}{2}$ l. gross and 550 $\frac{1}{2}$ l. as net annual value. The occupiers appealed on the ground that the valuation was made on principles contrary to law. There was machinery on the premises, part of which was to be dealt with as fixtures and part that was removable. The valuation was altered, but the Recorder adopted the following basis:—Land, 31 $\frac{1}{2}$ l.; fixture machinery, 39 $\frac{1}{2}$ l.; buildings, 202 $\frac{1}{2}$ l.; patent machinery, 127 $\frac{1}{2}$ l. The valuation thus became 592 $\frac{1}{2}$ l. gross and 399 $\frac{1}{2}$ l. rateable. The occupiers appealed. The Lord Chief Justice said he thought that it was now settled that, if there was machinery in a building, making that building fit for a particular trade or manufacture, and if that machinery was intended to remain there permanently, then it was a question of fact whether the presence of that machinery enhanced the rateable value of the building. In the case of the Tyne Boiler Works Company v. LONGBENTON it was held that machinery and plant were to be taken into account as advancing the value of the hereditaments. But, as the Lord Chief Justice stated, it was evident that machinery which would last a short time was in a very different position so far as making the premises fit for the particular trade was concerned, as compared with machinery of a large and heavy description which could not be replaced except with considerable derangement of the premises. The case was therefore sent back to the Recorder of Northampton in order to amend the valuation by stating what part of the machinery belonging to and repaired by the occupiers was to be taken into consideration as enhancing the value of the premises.

THE town of Creil stands on the Oise, and in the river is a little island containing the remains of a castle and of a church that was dedicated to St. Evremond. The name recalls a writer who was a friend of CHARLES II. and WILLIAM III., and who lived long in England. DICKENS gave the name to one of the characters in "The Tale of Two Cities." The church on the island at Creil dates, it is believed, from the twelfth century. Buildings of that time are rare in France, and at Creil a part of the edifice was altered to suit the Gothic style. In the early part of the nineteenth century the church was included among the national monuments, but more interesting subjects were afterwards found, and eventually it was sold and became a warehouse for pottery. More recently it was purchased by the municipality of Creil for 30,000 francs, and it is now proposed to remove the remains and to utilise the site for the Hotel de Ville. At the present time churches, whether old or new, are not in favour with the French authorities, but, as an example of art, some more consideration should be shown for this church, which has come to us from so remote a period.

## THE MUSES IN ART.

ONE of the pictures in the Royal Academy exhibition of 1784 was *The Tragic Muse*, by the President. It was a portrait of Mrs. SIDDONS. Either through satisfaction with his work, or as a compliment to the subject, REYNOLDS inscribed his name on the border of the robe. Mrs. SIDDONS imagined the writing to be embroidery, and, examining it more closely, she condescended to smile at the flattery, and the artist said, "I could not lose the honour which this opportunity offered me of transmitting my name to posterity on the hem of your garment." The

represented a popular actress as one of the muses. even Madame SARAH BERNHARDT appears as one of the Parnassian beings in any of her numerous portraits. in REYNOLDS'S time the muses had not entirely vanished from earth. They were part of the stock-in-trade, the inspirers, of every rhymster; they were produced by sculptors and painters, and they were made familiar to all who gazed in shop windows. The muses had become so identified with whatever was intellectual in Britain they had ceased to be recognised as the daughters of ZEUS and MNEMOSYNE. The great and orthodox MILTON was so often befriended by them, he was do-

MELPOMENE.

POLYHYMNIA (JULIA PIA).

chair in which the actress sat, and which was not especially made for the occasion, for it was used by other sitters, was afterwards given to BARRY, who with true Celtic enthusiasm spoke of it as "The very chair that is immortalised in Mrs. SIDDONS'S *Tragic Muse*, will have as much celebrity as the chair of PINDAR, which for so many ages was shown in the porch at Olympia!—this chair of Sir JOSHUA REYNOLDS may rest well satisfied with the reputation it has gained."

A portrait-painter in our time would hesitate before he

whether his muse would be considered as having any of paganism about her, and in one of his invocations he pleaded ignorance as an excuse to the righteous who objected to his meddling with mythology:—

Descend from heav'n, Urania, by that name  
If rightly thou art called, whose voice divine  
Following, above th' Olympian hill I soar,  
Above the flight of Pegasean wing,  
The meaning, not the name, I call.

It long seemed to be impossible for the humblest

the Belles-Lettres to be completed without the intervention of the muse. If a writer were in doubt she came to aid, as for example, in a battle scene—

But O, my muse! what numbers wilt thou find  
To sing the furious troops in battle joined?

If he wished to celebrate his ladylove, the highest she could give her was to say she was "the crowned muse's noblest theme," and what patron could resist the use of being informed that he served instead of a muse, as boldly done by the Rev. Mr. YOUNG, the sacred poet in "Night Thoughts"?—

With invocations some their hearts inflame;  
I need no muse, a Walpole is my theme.

If REYNOLDS were asked why he selected such a mode of representation, he would have been able to refer to a very ancient practice. Everybody likes to be exalted, if it were only on canvas. The Renaissance painters were accustomed to depict the people who gave them commissions as saints or as Greeks and Romans. In TITIAN'S *Supper at Emmaus*, out of the five figures four are portraits, viz. CHARLES V.; his son PHILIP, a cardinal, and the Emperor's confessor, all of whom affect to be peasants. Men and women were so often desirous to be idealised and immortalised in that way, it is now an entrancing pursuit by connoisseurs to identify the originals and to make paintings become aids to history or biography.

URANIA.

EUTERPE (LIVIA).

REYNOLDS was therefore in keeping with his time when he introduced a lady as a muse. In our realistic age it is not gained much by the attempts. His *Mrs. Norton* was lately exhibited in the Royal Academy, and in its pose everyone who looked on it must have acknowledged that in spite of its imperial bearing it was not as dignified as the portrait by GAINSBOROUGH, in which we see the actress in out-of-doors costume as unaffected as if she had dropped into a friend's house.

How far the practice was adopted by Greek or Roman artists it is not always easy to determine. There is no doubt that at one time in Greece it was thought to be a crime for an individual to allow himself to be represented as a divine being, or associated with an Olympian. One of the charges in the indictment against PERICLES arose out of the supposition that a figure resembling him was to be found in a group on the shield of ATHENE. On the other hand, there are many traditions which support the view that

as well-known people were used as models, more or less fidelity to their traits was permitted, and to the initiated, at least, the portraiture was evident. It is possible, moreover, that in an age when posing as a god or goddess was rigorously interdicted, it was allowable to appear in the guise of some of the other varieties of figures which constituted Grecian mythology. For women there could be no irreverence if they were painted or modelled as muses.

In every age there has been vagueness not only in the descriptions but in the enumerations of the muses. In the centenary celebration of VICTOR HUGO, in Paris, there were only eight women appearing as muses on the triumphal car. The number possibly was owing to the difficulty of symmetrically arranging nine figures, or from the belief that on such occasion the poet's bust served instead of a muse. There is, however, ancient authority for that number of muses forming the celestial octave of the music of the spheres. But even in antiquity there was uncertainty about them. Besides the ordinary nine, CICERO speaks of two other families of muses. HOMER is not precise in his reference to them, for before describing the Grecian troops he invoked the muses as follows:—

Tell me (for ye are heavenly, and beheld  
A scene, whereof the faint report alone  
Hath reached our ears, remote and ill-informed),  
Tell me, ye muses, under whom, beneath  
What chiefs of royal or of humbler note  
Stood forth the embattled Greeks.

The weight of such evidence as has survived is in favour of the legend recorded by HESIOD, who mentions nine muses, whose names were CALLIOPE, CLIO, MELPOMENE, THALIA, EUTERPE, TERPSICHORE, ERATO, POLYHYMNIA and URANIA. It has been suggested that the belief in the muses was derived from Macedon. At a later time the Greeks ignored the foreign origin, and they concluded that as APOLLO had a musical contest with MARSYAS their muses conquered an equal number of Macedonian singers. To the Greek mind the muses appeared as the tuneful choir around the altar of the gods. CALLIOPE signifies one with a beautiful voice, and is pre-eminently the muse of epic poetry; CLIO is the muse of history; MELPOMENE of tragedy and mournful songs; THALIA of comedy; EUTERPE of the flute and lyric poetry; TERPSICHORE of choric dancing; ERATO of love poetry; POLYHYMNIA of odes and hymns; URANIA, the heavenly one, of astronomy. They were all musical; URANIA especially was honoured by those who held that not the smallest orb "but in his motion like an angel sings."

The Romans would not be so hampered as the Greeks in dealing with the muses. It was good taste to admire them. It is known that in the porticus of OCTAVIA there was a series of statues of the nine muses. In the excavations on the site of what was thought to be the Villa Cassius figures were found which were judged to be also part of a similar assemblage. They would suggest that the Romans were pleased in having so much variety, and at the same time some correspondence between the figures. With them it may be assumed there was a representation of APOLLO as Musagetes or musical director, and he presented a different appearance from the god with the silver bow, of which one version, the Belvedere, is among the most admired of ancient statues.

The statue of MELPOMENE, which we illustrate, may have formed one of a series, or it may have been the representative of Tragedy in POMPEY'S theatre at Rome. The figure carries a mask resembling HERCULES, whose fate was essentially tragic. The muse wears the costume that was familiar on the stage in the theatres, and is one of those grave-gowned beings that would be suited to the severities of the antique drama. But it is much less demonstrative than REYNOLDS'S *Tragic Muse*, which is expressive of a more neurotic age.

If we suppose MELPOMENE to be an ideal representation, the figure of JULIA PIA is considered by VISCONTI and other archæologists to be a portrait statue in the guise of one of the muses. It bears a strong resemblance to the portraits of the wife of SEPTIMIUS SEVERUS which are found on coins. She wears the palla or mantle, which covers her head as a veil and which was in use by Roman matrons. Figures of POLYHYMNIA and of MNEMOSYNE have been met

with which are similarly clad, but although it is the empress was portrayed as a muse, there can be no decision as to which of the nine is the subject, for their symbols were not always employed. The dress is admirable, and the position is worthy of a woman not only the wife but the mother of an emperor, and like some noble Roman matrons, was not afraid to live rather than witness the misfortunes of her family.

The statue of URANIA owes the head and the face to FRANÇOIS GIRARDON, a sculptor who was in France in the reign of LOUIS XIV. He had several assistants, and it is not certain that the operations were carried out by him. The figure was traditionally known as URANIA, and on account GIRARDON introduced a diadem of stars to the head. It is held by some archæologists that the figure of the left arm in raising a part of the robe corresponds with a figure of Hope that is often seen on Roman statues, but instead of a scroll the right hand holds a flower.

The statue which is presumed to represent the wife of the Emperor AUGUSTUS, is an example of a mode of treatment which is not unknown to the art of ancient sculpture. LIVIA was the mother of TIBERIUS prior to her marriage with AUGUSTUS, and she was obliged to conceal the death of her husband until she was arranged for the succession of her son. In this case, the face and head may resemble the crafty LIVIA, though the statue belongs to some unknown model. It would appear that in Rome there were certain figures which were much admired, and which generally bore the attributes of other of the muses. On one of those draped bodies which was placed which would be a portrait of some lady, a statue was expeditiously created. In that way the peculiar figures resembled the tombstones awaiting inscriptions which we see with monumental masons, and are analogous to children's books which were popular at the beginning of the last century, in which there were figures with an empty hole instead of a head, and the artist was to fill the space with a portrait. Bodies of this kind, we may assume, were common enough in the workshop of the Roman master-sculptors. In those days it was possible to utilise machinery in their production, but it was not difficult to obtain Greek slaves who were compelled to make repetitions of the finest drapery, and then the hands might occasionally carve the head which, in the case of the LIVIA, often suggests commonplace treatment.

The muses might have passed away with much more belonging to antiquity if they had not been utilised in the early Christian Church. The Psalms referred to the music of the spheres, and the sun and stars were said to utter the praises of their Creator with joy. It consequently was not that the Pagans had a glimmering of the truth, but that the muses signified the planets. The World was personified as Mercury, CALLIOPE; Venus, TERPSICHORE; the Moon, MELPOMENE; Mars, ERATO; Jupiter, EUTERPE; Saturn, POLYHYMNIA; and fixed stars became URANIA. There was no place for THALIA. By association the theory of the music of the spheres became established. It was not until during the Middle Ages, and the revival of learning confirmed the theory, because it was found that many of the writers were upholders of it. In the Elizabethan age there were poets to whom it was like a necessary truth. SHAKESPEARE was among them, and the doctrine was never so beautifully expressed than in the immortal passage "Merchant of Venice," and which, according to MR. O'BRIEN, the late LORD RUSSELL of Killowen prize all others in the play:—

Look how the floor of heaven  
Is thick inlaid with patines of bright gold:  
There's not the smallest orb which thou beholdest  
But in his motion like an angel sings,  
Still quiring to the young-eyed cherubins;  
Such harmony is in immortal souls;  
But whilst this muddy vesture of decay  
Doth grossly close it in, we cannot hear it.

That may be regarded as the fullest development of the idea of which the muses were early, if not the best, representatives. Art has produced nothing which can be compared with the words of SHAKESPEARE. Illuminators and painters have endeavoured to suggest the harmony of the stars, but in such a case words are superior.

trait figures like those by Roman sculptors, or such things as the *Mrs. Siddons* of REYNOLDS, only materialise in an insufficient form. Worst of all is the captured Bath of Apollo at Versailles, where the divine seems appear as the attendants of LOUIS XIV. Perhaps it is in account of the risk of lowering what was noble the gods are in modern times avoided as subjects. That is, however, to be regretted, for a belief that is so ancient, and at the same time so exalted in its relations, should not be entirely ignored by men. Nor should it be supplemented by additions to correspond with modern notions and the diffusion of knowledge. "Astronomy and poetry, terrible muses," as TENNYSON says, do not personify "with the great sphere-music of stars and constellations."

### AMERICAN PRACTICE.

THE title of the United States is in itself an incentive to co-operation. FRANKLIN'S hint to his countrymen when the Revolution was impending, that if they did hang together they would hang separately is still remembered. In no country are companies, associations or societies more easily organised than in America. In accordance with the principle, foreigners are allowed to take part with the citizens by contributing towards the cost of enterprises of all kinds. The most characteristic of American buildings is also typical of union, for it is a town or one roof, in which the various dwellings are accessible by common lifts.

But how does the principle affect the practice of architecture? There are partnerships between architects in America as in other countries, but in the States, as in Europe, it is a general rule to avoid them. Owing to the large distances between towns in America, it may not be possible for an individual in Boston or New York to visit buildings in remote States. But, in spite of the difficulties, it appears to be the case that many successful architects have contrived to dispense with partners. Union and co-operation occasionally asserts itself among architects regardless of all obstacles, and it exercised no small influence at the last Convention of the American Institute of Architects, of which the official report has reached us.

What, for instance, is the Tarsney Act, about which so much has been said during several years, but a measure allowing architects in private practice to co-operate in officialdom in the designing of the public buildings of the United States? For a time the monopolists were able to keep outsiders at bay. But during nine years it has been possible for the Secretary of the Treasury to obtain designs for a Government building by competition among not more than five architects, and to pay for architects' services out of public funds. In its operation the Act is declared to be eminently successful, and it is an auxiliary to unity. There is one great impediment which prevents the Act from being perfect, and that is the difficulty of compelling architects to co-operate with the architects to the extent desired by the latter. There is a second and inferior difficulty, although it may cause more inconvenience, viz. the conduct of the superintendents of construction, who correspond with clerks of works in this country.

It is well known that there is no more efficacious method of creating republicans than by sharing public money among men. Architects, builders and superintendents engaged on public works in that way become equals. But American architects wish to retain privileges which can be traced back to the days of monarchs, when freedom was supposed to be unknown. That superiority is not shared by the superintendents and builders to be in keeping with a free country. Dr. JOHNSON said that while in most people were glad to have levelling down in public affairs, few cared to have levelling up. The Tarsney Act does not create equality, and has the effect of increasing the antagonism between professional and non-professional classes engaged in building.

The architect who succeeds in obtaining a commission for Government building is naturally anxious to prove himself worthy of this responsibility. We are told that when he prepares designs "in his imagination there exists a beautiful well-finished structure; he writes the specification

describing the construction, which to him represents perfection in solidity, form, texture and finish, and describes in unmistakable terms his ideal." The builder, unhappily, is indifferent to the imaginative, and at once prepares to translate it into prose. He reads the specification and "checks it off line for line to discover how he can build to come just under the exact wording of the specification and yet omit the necessary expense incident to carrying it out in the spirit in which it was conceived, and submits a proposal accordingly," for in America "bidders for Government work usually base their figures upon the execution of such work as will pass inspection and be accepted, and not upon the character of work which is ideal." The ideal is generally presumed to be something which is not palpable or manifest, and, considering the difficulty of attainment, it seems to us rather hard upon American builders that they should be expected to give in definite prices for anything which is indefinite in its nature. Who can tell how many operations may have to be gone through before the ideal can be presented to view on paper? But it is not fair to expect a contractor to execute and destroy work over and over again because it has not reached the perfection of an architect's vision. It is possible the American builder will endeavour to interpret drawings and specifications in a very free, economical and lax way, and steps should be taken to compel him to carry out his agreement. But that is different to punishing him because he may not have succeeded in realising ideals which, if seen in dreams, the architect may have been unable to express.

According to one of the speakers, the only remedy "is to take the work away from the unreliable builder and award it to a better one at a higher price, taking the difference in price from the bondsmen of the first builder." That would be an effectual means to put a stop to low-priced tenders and to increase an architect's fees. The American Government, in theory at least, possess already efficient measures for dealing with contractors who are acting unfairly, but they are so expensive and destructive they are rarely put in force. By merely giving an eight-day notice the Government can obtain possession of the works, with all plant and materials, and complete the contract at the cost of the contractor and his sureties. As a less severe remedy, it was proposed at the Convention that the architect should have the power to proceed with any work that was not being executed to his satisfaction, and to meet such contingencies about 10 per cent. on all payments should be retained.

It will be asked, If bad work is possible what is the use of the superintendent of construction? He, in fact, is another example of what follows in America when union is not respected. He is appointed by the Government, and he may already have filled humble public offices. He looks upon himself as an independent authority, and after the manner of officials regards the civilian architect as an inferior. He feels there is no claim on him to be loyal to the architect, and he is allowed to send his reports to the authorities, by whom they are treated as confidential. The superintendent is not likely to have so exalted an ideal as the architect, and would no doubt pass work which the architect would have preferred to reject. The Secretary of the Treasury, who is responsible in the eyes of the country for the acts of all subordinates, cannot be satisfied when he knows that in every public building there is a possibility of an embroglio owing to the rival interests of the architect, the superintendent and the builder. To escape from the dilemma it was suggested to purchase the plans and specifications from the architect and to leave the carrying out of the works to Government officials. But the architects have not approved of the arrangement, and hence we must conclude that, in spite of all that is said to the contrary, architectural commissions under the Tarsney Act have their peculiar consolations. It is also known that the architects who have already obtained Government commissions are eager to be again concerned in public buildings, which is further evidence that although architectural ideals may not always be realised and superintendents and builders give trouble, yet profitable business is accomplished.

As the Convention was held at Buffalo, which was the scene of a large exhibition or Pan-American fair, the subject of co-operation was again treated, but under a

## NOTES AND COMMENTS.

EVERY visitor to Paris has admired RUDE's *Departure of the Volunteers in 1792*, which adorns one of the piers of the triumphal arch at the end of the Champs-Élysées. The superiority of the group over those by CORTOT and ETEX on the other piers is remarkable. It is now stated by M. LABADIE-LAGRAVE that originally RUDE was commissioned to produce the four groups, but, unfortunately for French art, was prevented performing the work mainly by apprehensions of THIERS. One of the contemplated groups was the Retreat from Moscow, but it was portrayed with so much realism, the Minister was afraid of the effect it would produce on the population of Paris. ETEX in consequence was able to obtain two groups and CORTOT one. The summit of the arch was, according to RUDE's design, to be crowned by figures representing the apotheosis of NAPOLEON, eagles being introduced with outspread wings. LOUIS PHILIPPE did not approve of the arrangement. Then RUDE offered to substitute a figure of France seated on a globe and with figures of four great Powers of Europe, subjected by NAPOLEON, shown as kneeling. THIERS believed the sculpture was likely to offend other nations, and consequently the scheme was not executed. The arch still remains incomplete.

THE alterations which have taken place in the Piccadilly Galleries will be advantageous to the exhibitors of oil-paintings rather than of water-colours. For drawings the old room in Pall Mall has not been surpassed. It is to be regretted, however, that the collection which is now to be seen in the Institute galleries is not more important if taken as a whole. Visitors have become so accustomed to average shows they are desirous of seeing one which can be taken as proof of progress in the art. As we are now publishing views of the building, we may be allowed to consider the *Ripon Cathedral* of Mr. HARRY HINE as one of the most interesting of the drawings. Ripon was so often made a battlefield in contests against northern rovers, the artist was justified in representing it on a gloomy day. Mr. FULLEYLOVE shows us the Ionic temple of Nike-Apteros in Athens. But a little more local colour in the surroundings would be an advantage. Mr. D. T. CAMERON has a view of Venice which will not satisfy either admirers of the narrow watery ways or of the palaces. Signor FORMILI evinces his versatility in the head of a girl, but he is more skilled in decorative work with many sinuous figures. *Rydal Water* is another example of Mr. BERNARD EVANS's strong painting, in which he expresses what he feels in a downright fashion. Mr. BYAM SHAW's *Before Dead Henry's Corse* cannot be accepted as historically correct. There is no record that HENRY V. was buried in the way that is represented, nor was HENRY VI. But the scene, apart from the title, would have served for many English kings. Mr. ARTHUR SEVERN usually does not particularise his subjects, and it was courageous of him to attempt *Fog Clearing, Billingsgate*. It is enough to suggest that Thames scenes are not exhausted. It would be interesting to have Mr. WHISTLER's opinion on the drawing. Mr. DUDLEY HARDY, in his *Fishwives, Boulogne*, shows a contrast between youth and age which all can comprehend. Mr. AUMONIER, in *Flowery May*, has introduced white flowers in a meadow with much effect, and his *Sussex Garden* is rich in vegetation, among which a little girl is introduced, with a man at a cottage door.

THE late ERNEST RENAN, being a Breton, was not without a sense of humour. He never wrote a book which could be regarded as humorous throughout, but there are a great many passages which, although under the guise of seriousness, can hardly be taken except as amusing. When he was in the ecclesiastical seminary preparing for the priesthood he was well grounded in the classics. He was probably more attracted by Latin writers than by Greek. He was acquainted also with some of the works produced by inferior Greek authors in Rome, such as PHILOSTRATUS, who was an art critic, and who wrote a book on pictures which existed at Naples. M. RENAN visited Athens, and he took care to have the world informed that he ventured

to say a prayer upon the Acropolis. He had always a feminine weakness for prayer, although latterly he belonged to no religion, and it was one of his strange wishes that he might be converted into a *paroissien* for the use of a lady who would wear fine kid gloves. So morbid an inclination was no doubt inspired by RENAN's peculiar humour. As he was one of the professors of the Collège de France, the Sorbonne authorities have desired to have a memorial of him on canvas. Instead of acquiring a portrait which gave rise to so much laughter when shown in the Salon, they have commissioned M. ANDRÉ BROU to represent him as praying on the Acropolis. So this is an incident corresponds with much that is known of RENAN's life, but it would have been preferable if some other event had been selected.

GALLIMARD, the French painter, was during his life subjected to very sharp criticism by many of his British artists. His works were supposed to be meretricious in character, and it cannot be said that posterity has reversed the verdict passed on them by his contemporaries. His name will long be known, if not as a painter, yet as a benefactor to young French painters. His property has descended to his daughter, and that lady having died, it has passed to the Association of Artists. Besides a country house, there will be nearly 1,000*l.* a year available. Mdlle. GALLIMARD proposed that the villa should be used as a residence by young ladies who appear to have artistic abilities, but who are too poor to wait for the development of their talents. The money will be applied to make allowance to them while they are learning at Montigny Corniers. If the State cannot approve of the arrangement, the funds can be employed for any philanthropic purpose that is desired. The legacy will be distributed through the agency of Baron TAYLOR's foundation, but the Société Française des Artistes have also had a bequest from another lady, Madame RUDEL DU MIRAL — of which the interest is applied to the benefit of painters who are poor, aged, or infirm.

## ILLUSTRATIONS.

SOUTH TRANSEPT, SELBY ABBEY.

WE published last week the appeal of the Vicar of Selby for aid towards the works which have become necessary to insure the safety of the tower of the Abbey church. About 1,600*l.* will be required, and this sum is not obtainable in the town. The old church was one of those founded by WILLIAM THE CONQUEROR, until the time of HENRY VIII. the Benedictine abbey was one of the most important in England. Selby was the birthplace of HENRY I., or BEAUCLERC. He was the son of WILLIAM who could claim to be an Englishman, in consequence was derided by Norman princes and nobles. The Norman church was rebuilt from time to time, nearly all the periods of Gothic are represented in the building. At the end of the seventeenth century the tower fell down, and it is evident the foundations must be weak, for it will be unavoidable to diminish the height of the present tower in order to remove the possibility of danger. Selby has been described as the only complete monastic church in Yorkshire, and, as the Vicar says, "among the hundreds of visitors who every year pass through the abbey there must be many who will be willing to contribute to the preservation of this beautiful building." The works of preservation will be carried out under the direction of Mr. J. OLDRID SCOTT, F.S.A.

(Concluded from last week.)

## Machinery Hall.

S building, as the name implies, was for the purpose of displaying all kinds of machinery, motive power, electricity, power-saving appliances in motion. It was situated on the same ground, and was separated from Kelvingrove Park by Dumbarton Road, over which a bridge was thrown to connect this portion of the exhibition with the other buildings and grounds. Its dimensions were 500 feet long by 320 feet wide, and it was roofed by five longitudinal spans, the centre one being 100 feet, with a span of 92 feet 2 inches. The trusses of the roof were of wood, having spans of 52 feet 8 inches. The roof had principals placed 13 feet 10 inches apart, and supported on timber standards placed at the face walls of the building and by the main principal of the steel centre span, intermediate supports being formed by open braced steel girders having spans of 41 feet 6 inches, these in their turn supported on tapered lattice columns. These columns, in addition to carrying the roof, were designed to carry the motive power to the machinery.

The roofs were covered with corrugated iron and glass, the glass being about in the same proportion to the floor in the Industrial Hall. On the lower parts of the steel forming the centre span were fixed cantilevers of steel, and a promenade gallery 15 feet broad and 12 feet above floor level. On the outer ends of these cantilevers girders were carried which served the double purpose of supporting the floor of the gallery and forming the parapet or balustrade. These girders were 4 feet 3 inches deep, and had a span of 41 feet 6 inches. The floor of the gallery was formed of joists and decking resting on the bottom flange of the girders. This gallery extended along both sides of the main floor, and across the ends, so that visitors were enabled to walk round the building without requiring to go up or down the stairs leading to the main floor level. At the end of the hall three flights of stairs descended to the lower level from the level of bridge crossing Dumbarton Road. These were formed of timber and having an easy rise, the treads being 14 inches and the risers 5 inches. The treads were finished with 7-inch by 2-inch timbers. The floor of the Machinery Hall must necessarily be of great strength in order to withstand the heavy weights of most exhibits.

The floor should rest on the solid earth after this has been levelled and consolidated. The floor used here was 9-inch by 12-inch battens laid close together over the entire area, and supported by cross runners 11 inches by 3 inches laid flat at 4-feet intervals, forming a strong and solid floor.

Channels are required under the floor for conducting water pipes to the various exhibits. These should be of ample size, measuring about 3 feet 6 inches wide and 5 feet 6 inches deep, so as to allow space for a man to crawl along and make the various connections or repairs to the pipes. The flooring should be made movable at convenient intervals to give access to the ducts. For temporary exhibitions, such as an exhibition, the side walls of the ducts can be made of wood sheeting, with wallings and struts.

In arranging the exhibits, which, of course, is the work of the engineer in charge of this section, it is better to confine all exhibits to one section of the building, and the lengths of ducts being thereby reduced to a minimum.

The side walls of the Machinery Hall were formed similar to those of the Industrial Hall, that is, with wood-framing and finished with fibre plaster.

Ventilation of a machinery hall is of great importance. Summer sun streaming through the glass roofs, combined with the heat arising from the network of hot pipes in the building, renders the interior at times almost unbearable. Nothing short of mechanical ventilation is of any use. A system of exhaust fans sufficient to change the air in the building every fifteen or twenty minutes should be provided to make the building at all comfortable in hot weather.

The pipes running over the ducts containing the hot pipes should be insulated with some non-conducting material, as the pipes become so hot as to make them uncomfortable to touch.

Along the Machinery Hall was the boiler-house, a building 104 feet long by 70 feet wide. Here were placed the boilers for supplying power to the various machinery in the building. The floor of this building was 10 feet above floor-level of the Machinery Hall, but was surrounded

with a gallery or promenade 10 feet wide, running on a level with the Machinery Hall floor, so that visitors were enabled to obtain a better view of the plant than they would standing on the floor of the boiler-house itself, another advantage of the gallery being that it left the entire floor of the boiler-house free for stoking purposes. Both ends of the gallery communicated with the main hall, visitors entering at the one end and going out at the other, thereby circulating the traffic and avoiding congestion.

The boiler-house should be a lofty building and well ventilated at the roof, with doors opening to the outside at floor-level, thereby causing a sufficient current of air to carry off the heat generated by so many large boilers. The height of the present building to the wallhead was 30 feet.

The best material for the roof of the boiler-house is corrugated iron, and this material might also be used with advantage for the walls, providing the building is not conspicuous and an ornamental front unnecessary.

The floor, of course, should be of granolithic. As a preventive against fire, the mutual wall between the boiler-house and main hall should be of brick, carried up 3 feet or 4 feet above the wall head. Where it is at all possible it is of great advantage to have a railway siding alongside the boiler-house and Machinery Hall, both, as a convenient means of getting a supply of coal and also for facilitating the delivery and removal of all heavy machinery and exhibits.

Near to the boiler-house was placed the dynamo-house containing the various engines and dynamos for the supply of motive power and current for the electric lighting of the entire buildings and grounds.

At one or two convenient places throughout the Machinery Hall lavatory accommodation for the public was provided, but in addition to this it is essential to provide a sufficient number of staff lavatories for the use of workmen. In the Machinery Hall several hundreds of workmen were daily employed during the run of the exhibition, and in the majority of cases their work was of such a nature that the frequent use of the wash-basin is necessary in order that the workmen might present a tidy and smart appearance; and if the lavatories are provided at places easily accessible to the workmen, it will tend to induce the men to make use of them more frequently than if they were placed in out-of-the-way and inconvenient positions.

In connection with the Machinery Hall there should be provided an engineer's office, including private room, drawing office and room for clerks or public office, with private lavatory accommodation.

## Grand Avenue.

The Grand Avenue connected the Industrial Hall with the Machinery Hall, and also was connected with the Art Galleries by a short cross corridor, so that the whole of the main buildings might be termed as being under one roof.

The Grand Avenue was 1,000 feet long and 75 feet broad, and had a centre span of 55 feet broad by 30 feet high, with an additional 10 feet projecting from each side for placing exhibits. The roof was of wood and formed of laminated arch principals placed 14 feet 6 inches apart, connected by 8-inch by 2-inch purlins, the arch consisting of three thicknesses of 7-inch by 1-inch pieces, with 6-inch by 1-inch wood spears or radiating latticework, connecting arch to rafters, which were formed of two 7-inch by 1½-inch with 1 inch space between. The upright sides of principals were made of two 7-inch by 2-inch battens, with a 3-inch space to allow the arch to run down between and be bolted to sides of same. At the centre was a large louvred ventilator running the whole length of the building. The lighting was principally from the roof and the covering was corrugated iron and glass. The laminated arched roof is one that is particularly useful for exhibition purposes because of the effect gained at little cost. This form of principal requires to be very carefully constructed. The material used is so light in scantling that the downward thrust of the weight on the roof must be kept rigidly in a vertical plane, for if the arch buckles, which it has a tendency to do if not carefully made and put in position, it becomes an extremely weak truss, and will gradually go from bad to worse.

The principals should be constructed on perfectly level ground, or preferably on a platform; the joints of the laminations should be cut true and joined tightly. Special care should be taken when erecting to keep the trusses flat by poles bound from side to side. The extreme west end of the Grand Avenue connected with the bridge which spanned Dumbarton Road, and the levels were so arranged that the west end of the avenue and the gallery round Machinery Hall were practically on the same level, and by giving a slight camber to the bridge connecting the two, sufficient headroom was got for the roadway below the bridge. By this arrangement all steps were avoided, and visitors could pass along the Industrial Hall through the Grand Avenue, over the bridge and round the gallery of Machinery Hall without requiring to make use of a single step.

The Grand Avenue had one entrance from and an exit to Dumbarton Road near its centre, in addition to large exits at either end leading into the park.

#### *Concert Hall.*

The Concert Hall was a circular building, this form being adopted chiefly on account of the accommodation required and the shape of the site available.

The building was 140 feet in diameter, exclusive of the outside surrounding corridor, with a gallery all round except at the portion occupied by the chorus, orchestra and organ. In the original design for this building an organ recess was formed behind the chorus and four additional rows of seats were provided in the gallery with two additional staircases, giving seating accommodation for about 5,000 persons.

The plan, however, was curtailed and modified, the organ recess being dispensed with and the width of gallery reduced, so that the building as executed could seat about 4,000 persons.

Surrounding the building ran a corridor 10 feet wide, formed as a lean-to against the main building, the various doors opening into the corridor allowing ample provision for exit.

The structural work of the Concert Hall was of steel. The steel principals were placed at 18 feet 6 inches centres, at the outer circumference of the circle, and were supported on two circular rows of steel columns, the inner and outer rows being 12 feet 6 inches apart. These columns rested on concrete foundations to which they were bolted, and were connected at the top and also at the gallery floor level with braced girders. They were also braced at these levels longitudinally, this bracing extending round the entire building, binding it together.

The roof was saucer-shaped, and rose to the height of 62 feet above the floor level at the centre. A cupola surrounded the crown, which served as a ventilator. Wood battens were bolted to the steelwork of walls, roof and ceiling, and to these the fibre plaster was nailed.

The hall was lighted from the centre of the roof, and also by side windows. The latter were provided with opaque blinds which were drawn over the windows when biograph or such like entertainments were being given. The roof externally was covered with McIlwraith's canvas decking, a material having a smooth surface somewhat like linoleum, forming a very suitable surface for paint, and keeping longer clean in a smoke-laden atmosphere than canvases or felts of a rougher texture, which have a tendency to gather dirt more quickly than the smoother material. The jointing of the canvas on a round roof must, of course, be vertical, tapering towards the apex. The cover should be ample, not less than 3 inches, and well bedded with red lead in the laps. It should be nailed with copper tacks placed about  $1\frac{1}{2}$  inch apart; ordinary tacks, even for a temporary purpose, should be avoided, as after an exposure to the weather for a month or two they begin to rust and break away, causing leaks and discolouring the roof.

In laying the canvas, care should be taken that the joints of the various strips are properly radiated from the centre to the circumference, otherwise a twisted effect will be given to the roof, and when a cheap material like this is being used, the workmen are apt to overlook this, their main object being simply to get the roof covered. When properly laid, these lines assist the perspective by accentuating the curved form of the roof.

The Concert Hall was the only building in which a system of heating was introduced. This, however, was found an advantage, making the hall more comfortable in the cold weather in the beginning of May and in the latter end of October and November. As in most round buildings, there was a tendency to echo in the Concert Hall when the building was poorly filled. A system of festooning hung from the ceiling was adopted, which to a great extent obviated the defect. For an orchestra or organ recital with a full house, however, its acoustical properties left nothing to be desired. I might mention that the interval of the echo increased as the centre of the building was approached by the speaker, the longest interval being when the speaker was immediately under the apex of the roof—a position, of course, which was never occupied in practice.

The restaurant adjoining the Concert Hall was chiefly constructed of wood, with fibre plaster as a covering on the outside walls. There is nothing in particular to describe about its construction or design. The chief point in restaurants of this kind is to see that ample accommodation is provided as regards the kitchen, its offices and stores. Large staffs are employed in order to cope with the inrush of visitors on particular days, and unless the accommodation is sufficient the staff as a consequence are much handicapped and visitors disappointed. Although these buildings are temporary, the business which is done in them is very erratic, doing practically nothing at times, while on other occasions they are taxed to their utmost capacity, and the kitchen accommodation provided

should be equal to the greatest demand. The kitchen service-rooms should be situated as centrally as possible, the former should have a concrete floor, and walls of brick, and up, say, about 3 feet above the roof, as a protection against fire.

In addition to the usual kitchen offices and stores, beer and wine cellars were provided in the basement, separate goods entrance should be provided in some place not too prominent, with direct access to the stores and outside.

In addition to the large dining-room and buffets, desirable to provide two or three smaller rooms for the private or small dinner parties.

Ladies' and gentlemen's lavatories should be provided in these restaurants, with separate male and female lavatories, and accommodation for the kitchen staff.

Electricity is the only illuminant which should be used in the inside lighting of exhibition buildings. This may be done either with arc lamps or incandescent lights. As to the decorative superiority of incandescent lighting over the arc lamp, there can be no question. The architectural effect of the curved principals of the roofs, the lines of pilasters, cornices, can be picked out, thereby assisting the architect in the effect of the interior and giving a warmth of colour to the whole. All these advantages are wanting in the cold and uninteresting effect produced by the arc lamp. Of course, to produce the same illuminating power the incandescent requires much more current than the arc lamp, and is consequently more costly; but in most of the large exhibitions a considerable amount of the lighting plant is supplied gratis by the exhibiting firms. In the case of the Glasgow exhibition, steam boilers, engines and dynamos were supplied practically free of cost to the executive, and had this power been sufficiently augmented by the exhibition authorities, the whole interior of the Industrial Hall at least might have been formed from the cold and unsympathetic effect which is sent with the arc-lamp system to the brilliant jewel-like effect which was so much admired when the exterior of the building was illuminated.

The electric lighting of the buildings was divided into distinct sections, namely, Industrial Hall, Grand Avenue, Machinery Hall, and each section was still further divided into several circuits, so that as little inconvenience as possible might be caused in the event of a breakdown.

The Industrial Hall was lighted by means of 345 10-ampere arc lamps suspended from the roofs. The Machinery Hall had 250 10-ampere arc lamps, and the Grand Avenue had 10-ampere arc lamps. It is necessary to distribute incandescent lamps over the buildings to act as pilot lamps when the arc lamps are turned off at night.

The Concert Hall was lighted by 330 16 c.p. and 32 c.p. incandescent lamps. For this building, however, was not enough. Even although the ceiling was painted white and acted as a strong reflector, an extra 100 16 c.p. would have given a more satisfactory result.

When large buildings are lighted by the arc lamps as a rule, are placed too low, and have a blinding effect, obscure the view. When kept well up they give a better more diffused light without dazzling the eyes, while at the same time they give an apparent increase to the height of the interior.

Wherever it is possible it is desirable to have dual systems of electric lighting, and if a supply of current can be obtained from a corporation or some other independent source, it should be connected to the exhibition system, and used as a stand-by in the event of any breakdown taking place with the exhibition plant.

Throughout the grounds several systems of lighting were adopted, chiefly electricity, compressed gas and compressed oil. Very satisfactory results were obtained from the compressed incandescent gas both as regards cost and illuminating power. The gas used was the ordinary Corporation gas, which has a pressure of  $1\frac{1}{2}$ -inch water gauge and was compressed by two large automatic gas compressors (worked by the city service) to about 8-inch water gauge.

In brilliancy it rivals the electric arc lamp, and in the comparative costs are about three to one in favour of the incandescent gas; compared with the ordinary gas light for light, the cost of the compressed incandescent is about one-fourth of the former. The amount of illuminating power used in the grounds of this system was about 240,000 candle-power.

It is a form of lighting admirably adapted not only for exhibition grounds, but for street lighting in towns, stations and wherever large areas are wanted to be brightly lit. It was first used on a large scale, I believe, in the grounds of the Paris exhibition of 1900.

Throughout the grounds eight conveniences, consisting of lavatories and water-closet accommodation for ladies and gentlemen, were provided at convenient distances from the main buildings, but should not be too prominently situated, but the notice directing to them should be placed in positions where they could be readily seen by the public.

will now deal for a moment with the cost of the buildings. While it is an easy matter for an architect to arrive at the approximate cost of a permanent structure built with the usual building materials, it is a more difficult matter when dealing with temporary buildings on a large scale with light scantlings, where the cheapest materials and workmanship are used. The following figures therefore may be of some value:—  
The cost of the Industrial Hall was about 60,000*l.*, or at the rate of 1*1*/<sub>2</sub>*d.* per cubic foot of contents (cubing the building from ground line to halfway up the roofs), or equal to 2*1*/<sub>2</sub>*s.* per square yard of covered area.  
The Machinery Hall cost about 22,000*l.*, equal to 3*1*/<sub>2</sub>*d.* per cubic foot of contents, or about 16*s.* per square yard of covered

area. The Grand Avenue, where no steel was used in the construction, cost 9,300*l.*, equal to 3*1*/<sub>2</sub>*d.* per cubic foot of contents, or 2*s.* per square yard of covered area. This building, however, was long and narrow, and all its walls were more heavily finished than those of the Machinery Hall.  
The Concert Hall, where the framework was entirely of iron, cost 12,600*l.*, equal to 2*1*/<sub>2</sub>*d.* per cubic foot.

The various restaurants and kiosks throughout the grounds, however, were built entirely of wood and plaster, ranged in price from 100*l.* to 5,000*l.*, the price per cubic foot of the former being 2*d.* and of the plainer types 1*1*/<sub>2</sub>*d.* per cubic foot. In conclusion, I may say that I have treated this subject from its utilitarian and technical side, and in doing so I have endeavoured to bring before you such details and facts as are peculiarly adapted to the class of buildings under description. While the materials and workmanship of a temporary building are necessarily of a cheaper and rougher quality than those used in permanent structures, the mere fact that this is so greatly increases the responsibility of the architect.

In the first place, with the permanent structure he is more concerned with the usual methods of construction, and where buildings are large and important, as a rule he has ample resources at his command, and the margin of safety is generally ample and any strain which is ever likely to come on them. In temporary structures, however, and particularly with regard to buildings, matters are somewhat different, for while the architect is required to produce buildings of large floor area with attractive elevations, the money placed at his disposal is, as a rule, none too plentiful for the requirements. In order to produce the best result he is compelled to keep the margin of safety of the structure to its lowest limit. The building must be stable enough to resist the heaviest loads on its floor and galleries sufficient to withstand the surging and jostling of immense crowds; and it is here the architect is faced with his chief difficulty, namely, how to arrive at a medium as regards his construction, so that he may not be unnecessarily on materials and superfluous strength, proportionately curtailing the amount of money available for the decorative part of the scheme. If, therefore, the architect has placed before you this evening, however inadequately it may have been dealt with, should be of value or service to any of you who may be entrusted with similar work, that which I have endeavoured to describe, I shall feel amply repaid with the effort I have made.

H. D. SEARLES-WOOD proposed a vote of thanks for the paper, which was formally seconded by Mr. W. J. GARDNER.

H. P. G. MAULE, who supported the motion, said that there was no doubt that Mr. Miller had given to the public the most comprehensive exhibition scheme that was ever carried out north of the Tweed. The success of the exhibition proved that it was an advantage for such ventures to be the work of one mind.

The PRESIDENT, in concluding the discussion, said that the exhibition could be a very valuable one to the student. The erection of cheap temporary buildings was always a problem to the architect, but Mr. Miller had made their task an easier one. The work at Glasgow displayed considerable artistic feeling.

## THE SOCIETY OF ANTIQUARIES OF SCOTLAND.

The usual monthly meeting of this Society was held in their library at the Museum, Queen Street, Edinburgh, on the 10th inst., Mr. David Murray, LL.D., vice-president, in the chair. Among the papers read was one by Mr. F. R. COLES, Keeper of the Museum, in which he gave a report of his season's work in continuation of a survey of the stone circles of the north-east of Scotland, with measured plans and sections, obtained under the Gunning Fellowship. The total number of sites reported on was seventy-four, of which ten were marked as sites of circles at the time of the Ordnance Survey, four which then remained are now sites only, six are now sites of a single monolith known to be the remnant of a circle, three have still the two pillars flanking a recumbent stone, and six are circles

without a recumbent stone. Altogether forty-eight sites are thus recognisable as stone circles. As a general epitome of the results of the surveys of the past three years it may be stated that upwards of seventy measurable circles and remains of circles have been surveyed, forty-one of which are of the type of circle possessing a recumbent stone. Proceeding to a detailed description of twenty-two of those last surveyed, the most interesting circle in the first section was that of North Strone, with a diameter of 67 feet, and formed of seventeen stones, including a recumbent stone. When excavated by Mrs. Farquharson of Haughton seven burials were found, with pieces of a decorated urn, burnt bones and chips of flint. In section second the most interesting circle was that at Candle Hill, Rayne, which originally consisted of twelve stones, and had a diameter of 60 feet. When excavated by Mr. C. Dalrymple a central deposit of cremated burials was found covered with stones and smaller deposits of the same nature in other parts of the area. A broken wrist-guard of polished stone was the only artificial relic found. The recumbent stone, now fallen on its side, measures 13 feet in length by 7 feet in breadth, and upwards of 16 inches in thickness. It is on record that the head courts of the district were held at the Standing Stones of Rayne in the fourteenth century. In the third section the most interesting circle was that at Ardlair, Kennethmont, which seems to have consisted of ten stones, set round a circle of 35 feet diameter. When excavated by Mr. C. Dalrymple in 1856 cremated burials were found within the area. On the summit of Candle Hill, Inch, a very remarkable circle of probably eight stones originally, of which only one now stands erect, surrounds a central cairn, and has an enormous trench surrounding it on the west side. The recumbent stone is over 13 feet in length, 6 feet in height and nearly 2 feet thick.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. W. Emerson, president, in the chair.

The decease of the following was announced:—Sir Richard Temple, hon. fellow, elected 1900; Mr. Walter Glynn Doolin, of Dublin, fellow, elected 1899.

### Royal Gold Medal.

The PRESIDENT said that the Council's proposal to present the Royal Gold Medal for the current year to the family of the late Mr. Bentley, as a mark of respect for the memory of a great architect, had been laid before the King, and, in reply, a letter had been received from General Sir Dighton Probyn stating that the proposal had received His Majesty's careful consideration; but that His Majesty, while fully appreciating the kindly feelings which had prompted the Council of the Institute to make the suggestion, was of opinion that unless the Council were in any way pledged to award the medal as proposed, or unless it could be shown that a case similar in character had occurred before, it would create a dangerous precedent if the medal for the current year were given to the family of the late Mr. Bentley, on the ground that in virtue of that gentleman's great service to architecture the Council would have recommended him for the medal had he lived until the date of their next meeting.

The Council will therefore after election submit another name as a fit recipient for His Majesty's gift.

Mr. S. K. GREENSLADE read a paper on

### The Planning of some Recent Library Buildings in the United States.

The development of the library movement in America during the last ten years had been so enormous that few buildings erected previous to 1885 would be found to-day suitable for modern requirements. The librarians themselves have settled points in the policy of the working of libraries which previously were undetermined, and it was the very active interest of these men which had so greatly assisted the architects to produce such very fine plans. Mr. Carnegie's generosity had helped forward the movement wonderfully. Last year alone he gave more than 2,500,000*l.* for new buildings. The result was that the American architect had unequalled opportunities, and was showing the greatest interest in his work. At present some of the recent plans seemed as perfect as possible, yet the interest in the subject was so great that new developments were sure to take place.

Various representative libraries were treated under the following heads:—(1) Reference libraries; (2) university libraries; (3) town libraries (in three divisions); (4) branch libraries; (5) small libraries. The planning and general arrangements of the buildings, stack-rooms, furniture, &c., were described in every detail, and illustrated by plans shown by the lantern.

In the first group was placed the Library of Congress at Washington, by far the largest library building in the States, being 470 feet long by 340 feet wide, with four great inner courts. The site was acquired in April 1886, and Messrs. Smithey & Pelz's plans were adopted, but no limit of cost was fixed. By the summer of 1888, Congress, dissatisfied with progress made, lodged the entire control of the work, including preparation of new plans, in the hands of General Casey, chief of engineers of the United States Army. In March 1889, Congress enacted that the building should be erected at a total cost of 1,300,000 $\frac{1}{2}$ , including previous expenditure, according to a plan prepared by General Casey. The plan was based on that originally adopted, and the building, under the new conditions, was at once commenced and finally completed in 1897.

The design for the New York Public Library, now being erected, is the result of two competitions held in 1896 and 1897. In the limited second competition twelve firms of architects were selected from those competing in the preliminary open competition out of a total of eighty-eight. Tentative sketches of the plans of each floor were issued with the instructions. The assessors (with those elected by the competing architects), Professor Ware, of Columbia University; Dr. Billings, the librarian, and Mr. Bernard R. Green, of the Congressional Library, finally selected a design which practically adopted the whole of the suggestions. The site allows of an isolated building with ample space for future extension, 455 feet frontage and 482 feet to the sides. The cost was not to exceed 340,000 $\frac{1}{2}$  without fittings, but it is estimated now to come to 660,000 $\frac{1}{2}$ . Before describing the plan in detail, Mr. Greenslade referred to some interesting and noteworthy points in the conditions of competition. The library will have shelving capacity for 2,000,000 volumes, and seems nearly as perfect a library as possible. Messrs. Carrère & Hastings, of New York, are the architects.

The State Historical Library building at Madison, Wis., is an extremely well-planned building, and forms an ideal reference library. It is to house 675,000 volumes. Architects, Messrs. Ferry & Clas, Milwaukee.

Of University libraries, those of Columbia and New York are particularly worthy of attention. They are not unlike in plan, both in general outline taking the form of a Greek cross. The great central reading-room—in one case octagonal and in the other circular—is the motive of the design in both buildings. Special study-rooms, with their books stacked around them, or near them, are an important feature of both libraries, and in each are treated in a different way. The Columbia University Library is, perhaps, the most monumental of those yet erected in the States. Its magnificent domed reading-room, placed at the intersection of the arms of the cross, is octagonal in form, the four sides at the angles being shorter than the others, and the whole is covered by a great dome. The lighting is from four very large segmental windows following the lines of the main arches to the sides. Architecturally the building is very fine, but it is evident that to obtain it utilitarian points have been somewhat sacrificed. This applies particularly to the storage of books, and the difficulty the staff has in handling them. Its total shelving capacity is 1,050,000 books; the cost was 240,000 $\frac{1}{2}$ ; architects, Messrs. McKim, Mead & White, of New York.

The library of the University of New York (also by Messrs. McKim, Mead & White), though much smaller than the Columbia University Library, is in some ways more compact in plan. Its domed reading-room is circular on plan, and the books are stacked round about it and not below, and are generally more accessible. Its present shelving capacity is for 250,000 volumes. Shelf room for 1,000,000 volumes altogether could be obtained by using the large auditorium below the reading-room for stacks.

The library of the Law School at the University of Pennsylvania—a remarkably well-arranged and convenient plan—was also described. The architects were Messrs. Cope & Stewardson, of Philadelphia.

Town libraries were dealt with in three divisions—under Division I. Large Town Libraries, being grouped the Boston Library, Newark Public Library, Providence Public Library and Washington Public Library. In each of these buildings the motive of the design has been a different one. They all, however, evidence the growth of the free access policy and its great effect upon the plan. Not only is it necessary for the general reading-room to have, as in the Bates Hall at Boston, the walls shelved for books of reference, but the borrower must also be allowed shelves to select from. The excellent plan is adopted at Newark of placing open shelf-rooms on either side of the delivery hall, where thousands of books may be stacked. At Providence the shelves are placed between the entrance hall and the delivery space—not so good a method; still, the floor area at this point is so ample that the whole could be rearranged with advantage. In Newark the stock-rooms are nearly isolated—a great advantage should fire occur in the main building.

The Boston Library (Messrs. McKim, Mead & White, architects), one of the first great monumental libraries in 1888, was opened in 1895. Architecturally of value, its plan is not good from the librarian's point of view, but the librarians now know pretty well what is wrong, whereas fifteen years ago they were doubtful and uncertain. It is therefore unfair to criticise the plan of the Boston Library too hardly, because of the rapid developments since its construction. Still, there are many points in it that are particularly the position of the fine reference reading-room in relation to the stack-room, the cramped position of the delivery hall, and the unfortunate shape and position of the stack-room necessitating the use of carriers. The cost 473,000 $\frac{1}{2}$ ; its present shelving capacity is for 1,000,000 volumes.

The public library at Newark (designed by Messrs. McKim, Mead & White, Philadelphia) was only completed and opened in March 1901. It is evident that a deal of thought was spent in its arrangement and planning. A great point has been made of "free access" to the books both outside and inside the stack. There are some excellent points in the planning of the building. The arrangements for the stack-rooms, delivery hall, work delivery space and stairs are very good indeed, and the approach to these rooms from the main entrance is very direct. The cost of the building 60,000 $\frac{1}{2}$ .

The Public Library building, Providence (designed by Messrs. Stone, Carpenter & Wilson), was completed and opened in March 1900. The Boston Library, as already mentioned, from the librarian's point of view, was hardly a success. The planning of the Providence Library the librarian was invited in the attempt to solve a problem which has been altogether successfully coped with. An interesting result. A serious attempt has been made to meet the requirements of the "free access" policy, and to a large extent it has been successful. The cost of the building was 53,000 $\frac{1}{2}$  and the shelving capacity is for 225,000 volumes.

The design for the Washington Public Library was the result of an open competition. Ten well-known library architects were invited to compete, each receiving an honorarium of 50 $\frac{1}{2}$ . Other architects were also allowed to compete, and the result was that the plans of Ackerman & Ross, of New York, were selected (not a firm). The cost was limited to 50,000 $\frac{1}{2}$ , but this was stepped considerably, the total estimated cost being 100,000 $\frac{1}{2}$ . Building operations were commenced in August 1900.

At least two distinct types of town libraries occur in the libraries illustrated in Division II. The Atlanta and the Pawtucket represent one and the other. The Atlanta has only a basement and first floor; the others have an additional floor. At Atlanta the plan is more compact and therefore more easily worked as a library than the monumental plan at Pawtucket. The open-shelved study-rooms adjoining the stack-room and either side of the delivery hall are an excellent feature in the Atlanta library. The Pawtucket library has not been erected yet. It seems to come between the above types. All the important rooms are on the first floor. Among points worthy of note are the position of reference spaces (10 feet wide) on each floor, the stack-room, the important position of the children's library, which balances the general reading-room, and the provision of special study-rooms. Libraries of this size—averaging 20,000 $\frac{1}{2}$  to 50,000 $\frac{1}{2}$ —are becoming very numerous, and developments in their planning will always be taking place.

Detailed descriptions were given by Mr. Greenslade of the following town libraries in Division II:—The Library, Atlanta, Georgia (architects, Messrs. Ackerman & Ross, New York); the Carnegie Library, Davenport, Iowa (architect, Mr. W. A. C. Jackson, New York); the Public Library, Providence, R. I. (architects, Messrs. Crane, Goodhue & Fernald, Boston); and the Public Library, Fall River, Mass. (architects, Messrs. Crane, Wentworth & Goodhue, Boston).

The author next discussed the third division of town libraries. The effect of the "free access" policy is illustrated in the three libraries selected as examples, the Carnegie Library, East Orange (architects, Messrs. Kent & Jardine, New York); the library at Duluth, Minn. (architect, Mr. A. Rudolf); and the Public Library, Washington. The tendency to do away with the substitute columns with glazed screens between is a feature of all of them. In the East Orange and the Tacoma libraries the use of the radiating stack, the advantages of which are pointed out by the author, is new for a large building.

The system of branch libraries and stations is rapidly becoming organised in many of the large towns. At present few towns have started with a series of new buildings. Old buildings have generally been converted, such as schools, churches, private residences and shops. The branch library is likely to develop in the near future. It will be most interesting to watch the work of the advisory board of architects appointed to design the sixty-five new branch libraries of New York.

Andrew Carnegie has given 1,000,000. to build these libraries, and the Board of Library Trustees have just selected three firms—viz. Messrs. McKim, Mead & White, Messrs. Carrère & Hastings and Messrs. Babb, Cook & Ford—to take the entire charge of the designing and superintending of these buildings. These firms will confer and deliberate on the work.

Up to the present time the planning of the branch library has been studied perhaps in Pittsburgh more successfully than in any other town in America. There are five branches already erected of the seven presented by Mr. Carnegie, each on an isolated site (architects, Messrs. Alden & Harlow). Two were given of the Lawrenceville Branch, opened May 1899; the West-end Branch, opened January 1899; the Wylie Branch, opened June 1899; the Mount Washington Branch, and the Hazelwood Branch. It is interesting to note the gradual development of the plans. The growth of what is called the "turnstile control," resulting in the abandonment of the entrances to the reading-rooms from the delivery hall, as adopted in the West-end branch, and substituted afterwards by screens in the later plans, is also of note. Although the radial-stack plan is costly to erect, yet the advantages where a "free access" policy is adopted are very great.

Especially Mr. Greenslade touched upon small libraries. The plans of these have been particularly well studied in the State of Massachusetts. Hardly a village or hamlet is without one. Many of those around Boston are extremely successful. Here that H. H. Richardson erected several of his well-known libraries, such as the Ames Library at Easton, and those at Burn and Quincy. The great feature of the plan here is the alcove adopted as the main reading-room, and in alcoves all the books were shelved. This method has been found wholly successful from the readers' point of view, although architecturally the general effect of the alcoves

of many of the recently-erected libraries of this class have very compact plans. The little library at Wayland, (architects, Messrs. Cabot, Everett & Mead, Boston); the Small Library, Plymouth, Mass., by the same architects; the library at Weston, extremely convenient and well adapted for its purpose (architect, Mr. Jenne, Boston), were all noted.

Especially the lantern views, the paper was illustrated by a number of the original plans and photographs of the most interesting library buildings in the United States. Professor BERESFORD PITE, who proposed a vote of thanks to Mr. Greenslade, said the paper he had put before them was suggestive material. A considerable amount of congratulation was due to the Institute in the election of Mr. Greenwin Bursar in 1891. That bursary was founded for the promotion of the study of works of modern architecture.

The paper as a historical record, as well as an indication of what had been done, was something more than a catalogue of the use to which that bursary was put. They were accustomed to study architecture in temples and churches, and look to the past, and from archaeology to receive the light of art. In libraries they were in a new field. The originality of the subject, and the ingenuity that the Institute displayed in creating buildings for a want which essentially modern should be admitted. The skill, too, shown in the schemes with a view to future expansion of the building was most characteristic and remarkable. It was admirable if the bookstacks which were to accommodate the books were yet all in use. In the study of English architecture we came across national characteristics and peculiarities which were in many respects strangely different to those found in America. The American was more developed, and there seemed no fear of the library being crowded for anything but serious study, and thus visitors were allowed freer access to the books than was the rule in our country.

The paper would be of permanent value to the profession.

J. H. QUINN, chief librarian of the Chelsea Library, seconded the vote of thanks, said the paper proved that Americans in such work aimed at practicability. The natural design seemed always subservient to the object of the institution. This was an important feature. The Americans did not seem to suffer from want of funds, whereas in this country at the outset were interfered with by the need of planning, all important rooms should be put on the plan. Such an arrangement made a library less habitable for the reader and tramp, who did not like to climb.

Mr. OSBORNE SMITH was struck in seeing the first large library in the way in which the new country had come to the aid of the old in planning. Many of the arrangements were new in America, but they were in vogue in the British Isles. An interesting point was the warming of libraries by steam, what would be the effect on the books?

The PRESIDENT, alluding to the enormous size of the libraries and the number of books they could accommodate, said it mattered little whether the readers or the books were there at present. The matter seemed to prove that the library was part and parcel of the movement for increased instruction. The Americans realised the necessity of the higher education.

Mr. GREENSLADE, in returning thanks, said the libraries were extensively used and the stacks were filled with books. The children's rooms were crowded. The children prepared their lessons in the rooms; the library provided the books which were used in the local schools. Teachers sometimes brought their scholars, and instruction was given in the rooms. The heating of the libraries was a big question, but the arrangements and results were perfect.

### ANCIENT LIGHTS.\*

I WILL not occupy your time with any preliminary remarks, but commence at once *in medias res* and say, my contention and conviction are that the state of the law in England to-day with regards to rights of light is little if any short of an iniquity.

The Prescription Act (2 and 3 Will. IV. c. 71, s. 3) enacts "That when access and use of light to and for any dwelling-house, workshop or other building shall have been actually enjoyed therewith for the full period of twenty years without interruption, the right thereto shall be deemed absolute and indefeasible, any local usage or custom to the contrary notwithstanding, unless it shall appear that the same was enjoyed by some consent or agreement expressly made for that purpose by deed or writing."

The result in practice being that if where two men own two contiguous plots of ground and one owner wants to build and does build at once and the other owner does not want to build, then notwithstanding that he may have every intention of building eventually—if owner number two postpones his operations for nineteen years he is unable to use his own land in accordance with his desire without being hampered by certain so-called rights his neighbour has acquired to access of light to his windows and other openings over number two land. In effect, my neighbour can dictate to me at what period I am to build on my own land by building on his own.

Again, if both owners build simultaneously but A builds a more lofty edifice or a longer than B, if he is ever to increase the size of his building must do so within nineteen years of A's completion or be practically debarred from so doing altogether, regardless of whether B has any need or wish or even whether he is able to extend his premises within that time.

One more illustration, this relating to old buildings. In an urban neighbourhood a large factory is required that will give employment to hundreds or thousands of hands, or a public authority wish to erect a town hall, baths, library, workmen's dwellings or other institutions of public utility; both are hindered and harassed or altogether frustrated in their purpose because buildings not even on the same side of the road, and possibly the most wretched hovels, will be deprived of some light, ignoring the fact that the light which had been enjoyed was not provided for by the owner of the dominant tenement or at his expense or even by his forethought, but simply because the owner of the servient tenement had no need in the past to use his land in the same way or carry his building to the same height and extent as the owner of the dominant. Thus the most useful and necessary building we have imagined is curtailed in accommodation, marred in its usefulness and shorn of much of its beauty for what to my mind is an inadequate reason. One could suggest innumerable cases of a kindred nature, but it seems needless to do so when speaking to an audience of practising architects who are, of course, acquainted with the salient features of the law on this subject and its practical results.

I cannot see the rule has any foundation in natural justice, I cannot see that it is defensible, either ethically or on the ground of expediency. Why should not a man have to make his own provision for the light to his building over his own land or over the public way? If he will not provide an open space on his own land to light his building, why should I have to provide one on mine for him, at any time, earlier or later? Now how can an owner prevent his neighbour acquiring a right of light over his land? In one way, and one way only, and that is actual obstruction.

He may protest in the most emphatic and solemn manner, but it avails him nothing; he may give notices but they give him no protection. No, wherever his neighbour has an opening in his building, overlooking his land or buildings, he must erect a boarding (if he do not wish to build permanently) opposite to it.

\* A paper read by Mr. Walter C. Williams, solicitor, at the meeting of the Society of Architects on the 20th inst.

The hoarding may have to be 60 feet high and 500 long, may be a hideous eyesore to the surrounding property, may be a most oppressive, even ruinous expense, but up it must go, and must be retained there for a full year, for section 4 provides that an interruption to be valid must be for one complete year. Hence you will see, gentlemen, that as soon as light has been enjoyed for nineteen years and one day there cannot be an interruption of one clear year before the expiration of twenty years from the time of its first enjoyment, though the owner cannot bring any action until the full twenty years have elapsed. It is obvious that in some cases this remedy may be as costly as the value of the land.

Even if expense do not stand in the way, in London (and, I believe, in many large provincial towns and cities similar rules are in force), but in London should such a hoarding be erected for the purpose indicated it becomes, under the London Building Act, an irregular or temporary structure, and requires the license of the London County Council or local town council for its erection or retention, and should this license be refused, as it well might, the owner is in this delightful position: he finds he is by one Act of Parliament precluded from doing the very thing which, by virtue of another Act, is the only thing he can do to protect himself from the encroachments of his neighbour.

There is yet another anomaly and hardship. A man may be entitled in remainder expectant on the life of a young or middle-aged tenant for life, say, stepmother or brother, only a year or so senior. During the life of the tenant for life rights to light may be acquired which the remainder man has no means whatever of preventing or resisting, because, as I have pointed out, he must actually physically obstruct the view of the poaching tenement; but, as tenant for life, he has no authority to enter on the land about to be affected to carry out the requisite work. It may be the remainder man was an infant, *non compos mentis*, or abroad; it may be the tenant for life has acted in collusion with the building party; all this notwithstanding, the remainder man has his inheritance depreciated in value by the acquisition of these adverse rights that he was powerless to prevent.

The same with a landlord whose tenant allows rights of light to be acquired over the demised premises.

In *Frewen v. Phillips*, in the course of his judgment when sitting in the Common Bench, Pollock, C.B., says:—"It may be that if a man opens a light towards his neighbours' land, the reversioner may have no means of preventing a right thereto from being acquired by a twenty years' enjoyment, unless he can prevail upon his tenant to raise an obstruction, or is able to procure an acknowledgment that the light is enjoyed by consent." But who would, under the circumstances, give such an acknowledgment?

Section 7 of the Prescription Act provides that time shall not count against a person who is an infant, idiot, *non compos mentis*, feme-covert, or tenant for life, except where the claim is declared to be absolute and indefeasible. Section 8 also contains provisions protecting the owners of the servient tenement in cases of rights of way and water. But by Section 3, rights of light are "deemed to be absolute and indefeasible," and therefore the owner of the servient tenement is excluded from any protection given by Sections 7 and 8. I shall be interested in the course of the discussion to hear if any gentleman is ingenious enough to suggest a reason which justifies this harsh and, I contend, unjust treatment of the man against whom rights of light may be claimed.

Now let us consider how these rights came to be recognised by the Courts, and here it must be borne in mind that this is essentially a judge-made law in its origin; the Prescription Act only gave legislative sanction to a rule that had for some generations been acted on in the Courts.

The origin of the rule is obscure and the text writers do not throw much light on its history.

The older jurists gave no countenance whatever to these claims. There is a passage in Fitz Alwyne's "Assize of Buildings," written in 1189 (1-Richard I.), which runs as follows:—"Of the obstruction of the view from windows—Also if any person shall have windows looking upon his neighbour's land although he may have been a long time in possession of the view from such windows aforesaid nevertheless his neighbour may lawfully obstruct the view from such windows by building opposite the same or by placing anything there upon his own lands in such manner as may to him seem most expedient, unless the person who has such windows can show any writing by reason whereof his neighbour may not obstruct the view from those windows."

This reasonable rule held for 400 years, for we find a case in Crow's Reports, temp. Elizabeth, of *Bury v. Pope*, decided in 1589. The following is the report:—"It was agreed before all the justices that if two men be owners of two parcels of land adjoining and one of them doth build a house upon his land and makes windows and lights looking into the other's lands and the house and the lights have continued by the space of forty years yet the other may upon his own land and soil law-

fully erect a house or other thing against the said land windows and the other can have no action for it was folly to build his house so near the other's land. And adjudged accordingly. *Nota.*—"*Cujus est solum summitas usque ad coelum.*"

Two hundred years later Lord Hardwicke expressed in a case of *Fishmongers' Company v. East India* (1752), as follows:—"It is not sufficient to say it will plaintiff's lights, for then no vacant piece of ground built on. It is true the value of the plaintiff's house reduced, but that is no reason to hinder a man from on his own ground."

In a case of *Angus v. Dalton, Lush, J.*, in giving judgment without expressing any approval of the rule thought Statute of Limitation (21 Jac. I. c. 16), which fixes years as the time for entry on land, suggested that the acquisition of the easement of light. Then he continued: "The earliest recorded case that I am aware of was in that year Willmott, C.J., ruled that where a house built forty years and had had lights at the end of owner of the adjoining ground built against them obstruct them an action lay, and this he said is founded on the same reason as when they have been immemorial, for so long enough to induce a presumption that there was some agreement between the parties. And he said twenty years was sufficient to give a man a title in which he may recover the house itself, and he saw why it should not be sufficient to entitle him to any belonging to the house."

I do not follow the reasoning of the learned judge. There is much difference between adverse possession of which a man can enter or for which he may bring an action and the enjoyment by another of the access of light to his ground.

One can well understand that it is in the public interest to fix a limit to the time for litigation, for if a man be allowed to sue for a right which he has not used for many years, while another has been utilising it, he deserves to lose his interest therein.

But a right to light is quite a different matter, and is acquired against a man who is using his property lawfully and diligently only in a manner different from his neighbour. He may have a rope walk adjoining his neighbour's factory, and after twenty years he must not build because his neighbour has built first.

It should be remembered that the cases which founded the Prescription Act, and which were crystallised into statute law, were founded on the presumption of a person having continued for so long, it was presumed that the right to the use or enjoyment had been actually exercised. It was not the user *per se* that gave the right, but the fact that he had used it for so long that it was held to be evidence that the right had been actually exercised in the past.

The easement of light, however, differs in its nature from other members of the family. Rights of way and other easements may well be presumed to have been granted for the convenience of the actual or supposed grantee as well as of those who enjoyed them. They are also granted for the convenience of the many as against the strict right of the single owner. Whereas the right of light is for the benefit of the single owner at the expense of all his neighbours.

Again, a riparian owner is entitled to the undisturbed flow of a stream over or by his land, and if an owner interferes with the flow in any way the property is damaged, and that independently of any act on the part of the owner. But the claimant of right of light must himself have done in the past the very thing he now complains his neighbour, viz. have interfered by his own building with the access of light to his neighbour's property.

I contend that this judge-made rule is not founded on consideration of natural justice or ground of public utility. On the contrary, the voice of justice seems to me to say that a man must light his premises over his own land or the public and public utility there assuredly is none, as the right to light always to an individual at the expense of others.

I will now quote a few dicta of several judges on the subject. In *Angus v. Dalton, Cockburn, C.J.*, made the following remark:—"But after statute of James (i.e. statute of 21 Jac. I. for twenty years was"—here, again, without any legislative authority and by the arbitrary ruling of the judge—"held sufficient," and further on he quotes and agrees with Sir W. D. Evans, who says "its introduction was a principle of legal principles and an unwarrantable assumption of authority."

Again, in *Chasemore v. Richards*, Lord Wensleydale said: "It is going very far to say that a man must be at the expense of putting up a screen to window lights to prevent a title gained by twenty years' enjoyment of light passing to his neighbour's window."

In a case *Webbe v. Bird*, in which the plaintiff

have the right to currents of air to his windmill, J., says with scorn, "suppose some individual be owner of all the land round the windmill, must he build all round it to prevent the acquisition of a right by the owner of the mill?" Willes, J., in his judgment refers to rights as anomalous as compared with the general law, and says the C.J.'s scoffing question as to building a wall, and J., remarks that "The right to light has led to confusion enough."

The Exchequer Chamber, Wightman, J., approves of the principle that the presumption of a grant from long use only applies where the right might have been acquired.

In another case of *Bryant v. Lefever*, Lord Bramwell says, "who reads the cases relating to the acquisition of a right will see that there has been great difficulty to get on principle," and he goes on to quote with approval two judgments I have just cited.

In the Prescription Act by the custom of the City of London, rights of light could not be acquired in this manner, in virtue of the words in sec. 3 that I have already read, "local usage or custom notwithstanding," the City of London was brought into line with the rest of England. The reasons of uniformity are obvious, but I submit it would be better to have brought the rest of the country into line with the City rather than the reverse.

Coming to this alteration by the legislature, Lord Cranworth, in *Yeates v. Jack* says:—"I cannot but think the law derived from the custom exceed its evils. The necessity for lofty buildings is shown by the great advantage of them in all parts, and I cannot but fear that inconvenience may be felt by the abolition of the law."

With this, sitting to administer the law, however, I am concerned.

I just refer to one more dictum:—

In a very recent case of *Brown v. Warren*, Wright, J., at the end of a long judgment in favour of the defendant, said if it were admitted (and the C. A. held that it should be admitted) Wright, J.'s judgment "it would impose on the defendant an unreasonable burden."

In one still more recent of *Home and Colonial Stores v. Joyce*, J., appeared to entertain a similar opinion. Now, I think these remarks of many learned judges (and many could be found), extending over a long period of time, in the opinion that the law of light is not the result of human reason, does not satisfy one's idea of what the law is capable of—nay, calls for—amendment.

In concluding I must refer to the laws of some foreign

countries. In Scotland our English rule has never been accepted. As Lord Stowell says, in his "Principles of the Law of Scotland," "the right of light cannot be constituted by prescription alone, but a proprietor should have built his house ever so low, and not have built at all for forty years together, he is not to have done so for his own convenience and profit, but he cannot be barred from afterwards building a house on his property or raising it to what height he pleases, he is not tied down by his own consent." Another writer says, "The theory in Scots law is that a proprietor is only bound to provide light for his own property, and any open space may have is not to be reckoned on by his neighbour," and also a man had to provide his own light as well as his neighbour's. The Irish law, however, is now assimilated to the English by Lord Carew's Act in 1858.

In the U.S.A. in 1837, shortly after the Prescription Act was passed, an American judge—Judge Bronson—expresses his opinion:—"There is, I think, no principle upon which an English doctrine on the subject of lights can be maintained."

It is an anomaly in the law since the English law of ancient lights has been repudiated in our Courts. It cannot be applied in the growing cities and villages of this country without working most mischievous consequences. It is, I think, been deemed part of our law." And he refers to Kent's Commentaries.

In 1893 the New York Court of Appeal held that an owner of property may place his windows overlooking his neighbour's premises, but the neighbour may build to the height of his land nevertheless.

Now it is provided that a man may not have a window or a balcony or other projection over his neighbour's estate unless there is a distance of six feet between the wall on which they are made and the neighbour's estate; nor a side or oblique view on the same estate if there is a distance of 6 decimetres.

The Italian code is similar, but the distances are slightly

different. In Canada maintains the French rule.

Sweden a man must not construct windows nearer than six feet to his neighbour's land.

In France in none of these countries can a man rely on his right to light, but must make suitable provision for

himself. Hence we see another example of the isolation of our beloved country; whether it be a splendid isolation, however, is a matter on which a man may "have his doubts."

Now, having briefly considered the state of our law as to light, and briefly how that state came about, and having heard the opinions which some of our judges entertain of the doctrine, and having taken a cursory glance at the law of other countries, I ask you, gentlemen, are you satisfied with the law of your own? If not, there is one remedy, and one remedy only—legislation.

This legislation need not be fantastic or complicated; it could be simple but at the same time effectual, both practical and practicable.

I would suggest an enactment providing that no further rights of light across another's land should be acquired. That existing rights should be extinguished—

1. As to freehold, at the end of fifty years.

2. As to leasehold, at the expiration of fifty years, or the existing term, which period should be the shorter.

This would entail no hardship on anyone, would do an injustice to no one. The man who had built would still have all that he paid for, his land and the materials on it, and the owner of adjacent land would enjoy his own in his own way without being jeopardised by the operations of his neighbour.

I can conceive some objection to this in the case of abnormally high buildings, but this might be easily provided for by giving owner of adjoining building, over say 50 feet high, a right—which indeed I think they would have without special provision, under the maxim, "*sic utere tuo ut alienum non lædas*"—to compensation, not for obstruction to their light *per se*, but for any general damage that might be actually proved in each case by appropriate evidence, as in suits to abate a nuisance.

It now only remains for me to acknowledge my obligation to Mr. Blythe's paper, read before the Incorporated Law Society, for the references to some of the older cases and for information as to foreign law, and to thank the Council of this Society for having honoured me by the invitation to open this discussion, and you, gentlemen, for the patient attention you have given to my remarks.

## SURREY ARCHÆOLOGICAL SOCIETY.

THE annual meeting of the Surrey Archæological Society was held at Guildford on the 15th inst., Viscount Middleton presiding. The report alluded to the satisfactory results which had attended the excavations at Waverley Abbey, Farnham. During the year the foundations of the pulpitum, or portions belonging to the monks' stalls, were discovered, as well as the foundations of the lay brothers' infirmary hall, measuring roughly 94 feet by 41 feet, with the bases of the pillars of the north and south arcades *in situ*, and for the most part in excellent condition. Dr. Finny, mayor of Kingston-on-Thames, proposed a resolution requesting the Council to appoint a deputation to take part in the celebration at Kingston of the millenary of King Edward the Elder. He said Kingston possessed the stone upon which seven of the Saxon kings were crowned, and by a most strange coincidence exactly 1,000 years separated the coronations of King Edward the Elder and King Edward VII. Edward the Elder was the first crowned king in this country, and there had been an unbroken series of coronations for a thousand years, Edward VII. being the fiftieth consecutive Sovereign, and therefore the jubilee Sovereign to be crowned, a succession which no other kingdom could equal. He had communicated the interesting information to His Majesty, who had sent a letter in reply expressing in warm terms his interest in the proposed millenary, which would be celebrated a month before the Coronation. Mr. Ralph Nevill seconded the motion, which was carried. The Society resolved, on the motion of Mr. R. Nevill, seconded by Lord Farrer, to support the proposal for founding a society for the printing of the parish registers of Surrey.

## MERSEY DOCK BOARD OFFICES.

A MODEL of the palatial offices about to be erected on the site of the George's Dock by the Mersey Docks and Harbour Board is at present on exhibition in the Liverpool Exchange Newsroom, where it has created a great deal of interest among business men generally. The plans, as they have now been finally approved, says the *Liverpool Courier*, show a rectangular building covering some two-thirds of the chosen site of over 12,000 square yards, with the main frontage to the river, instead of having the chief entrance on an angle, as was the case in the original design, which secured the first prize in the competition nearly two years ago. Acting on the recommendation of the architects, Messrs. Briggs & Wolstenholme, F.F.R.I.B.A., and Messrs. F. B. Hobbs,

A.R.I.B.A., and Arnold Thornely, A.R.I.B.A., the Dock Board reopened the question of the site with the estates committee of the Corporation, and it was decided that the land could be more advantageously dealt with on the rectangular plan than in the manner at first suggested, and the present scheme was accordingly adopted. There are three entrances to the building, the principal doorway being in the centre of the frontage, and two others in the towers facing the east, towards the city. There are in all four towers, 144 feet in height, one at each corner of the building. The style of the whole design is Late English Renaissance, and a new feature in the adopted plan is a massive dome rising from the centre of the building towards the front to a height of 220 feet, or about twice the height of the Town Hall dome. At each side of the main entrance are niches for sculpture, and on the arched cornice of the building, immediately above the doorway, is a massive figure of Britannia.

In front of the building there is a forecourt, 60 feet in length, enclosed within a stone balustrade wall. The material used in the construction will be Portland stone, with the roof of green Westmoreland slates, and the dome is to be covered with lead. From the entrances in the towers facing James Street and Brunswick Street a wide corridor leads to a large central octagonal hall, 42 feet in diameter, and surrounded by an arcade which increases the width to 63 feet. From this central hall there is an open space right up into the dome, and all round there are galleries opening on to the various floors. In the hall the passenger lifts, six in number, are placed, and there is also the large staircase leading to the different departments. The rates and dues office, 196 feet long and 40 feet wide, is on the ground floor, and faces the proposed new street on the east side of the building, and has an entrance at either end. At the Brunswick Street side of the same floor is the warehouse manager's department, and in the end facing James Street is that intended for the harbour-master and his staff, while looking towards the river are the accountant and treasurer's departments. On the first floor are placed the offices of the marine surveyor and water bailiff, the check department, statistical department, the principal examiner of weights and materials, and the traffic manager's department, while looking on to the proposed new street, on all the floors except the ground floor, are spare rooms, which can be used when necessary or as the development of the board's business necessitates.

In the original plan the board-room and general manager and solicitor's departments were on the first floor, but in the scheme as now adopted these are placed on the second floor. The board-room and committee-rooms will face to Brunswick Street, while the general manager's department will look on to the river, and the solicitor's suite of offices towards James Street. On the third floor are the members' luncheon-room, the estates and rating department and a portion of the general manager's staff, and immediately above, on the fourth floor, are the clerks' dining-room, kitchens, keeper's house and spare offices. On each floor there is lavatory accommodation for every department. The building will be fireproof throughout, and it is expected that the work of preparing the site will be commenced immediately. It is the intention of the board to at once carry out the whole scheme, and it is estimated that three or four years will be required to complete the building and make it ready for occupation. The model at present on view has been constructed by Messrs. Norbury & Co., of Upper Duke Street, and is on the scale of a ninety-sixth of the real size of the building.

### GENERAL.

**The Royal Society of British Artists** have elected the following members:—F. G. Fry, L. Lewis, E. Ertz, Harry Dixon, Hans Trier, Charles Q. Orchardson and Professors Kirchmayer and N. Wilkinson.

**A Professorship** for the study of American antiquities has been founded at the Collège de France through the liberality of the Duc de Loubat, who has given to this institution an annual sum of 6,000 francs.

**Mr. Nuttall** has been commissioned to paint the picture of the opening of the Australian Federal Parliament. When completed, it will contain some four hundred portraits, including that of the Prince of Wales.

**The Bust of Victor Hugo**, by David d'Angers, has been presented to the Académie Française by M. Georges Victor Hugo.

**The Court of Common Council** have adopted plans for the erection of a new police-station in Moor Lane, at an estimated cost of 24,240*l.* Authority was also given to expend a sum not exceeding 5,800*l.* on erection of temporary cells at the Old Bailey. The Council resolved to expend 4,000*l.* in the purchase of the freehold site (about 5½ acres) of a recreation ground for the City of London School, less 1,850*l.* subscribed by old pupils.

**The Prefect of the Seine** is having lists prepared of buildings and historic monuments of Paris on which posting of placards will no longer be allowed. In preparation the authorities are assisted by the Commission Paris. A discreditable spectacle which was presented election times, and which was vandalism of the worst therefore to be abolished.

**The Rev. Thomas Hervey**, rector of Colmer-cum-Dean, Hampshire, has passed away in his eighty-sixth year. He published a history of the joint parishes of which he was incumbent since 1853, setting the type himself and illustrating the book from photographs which he had himself taken.

**The Paris Bourse** occupies a part of the site of the convent of St. Thomas Aquinas, which was suppressed in 1564. The first stone of the present building was laid in 1808, designs were prepared by Brogniart. The Bourse is now enlarged, and a part of the foundations of the conventual walls has been discovered, particularly the chapel, which was erected in 1542.

**The Home Secretary** has appointed Mr. Gilbert Ram, M.I.E.E., to be Electrical Inspector of Factory Workshops.

**Mr. A. D. Webster**, superintendent of Greenwich Park, assisted by Mr. Herbert Jones, has been carrying out excavations in the park. The floor of one of the Roman villas, with a considerable portion of the tesserae has been laid bare. A number of Roman coins, decorated wall plaster and many pieces of pottery have also been discovered. Mr. Webster has had the floor left uncovered, fenced round in order that the public may have an opportunity of viewing these remains.

**The Competition for Signboards** in Paris has been arranged. The examples, which must be of new types, are to be deposited in the Petit Palais on the Champs-Élysées on October 11. The jury will consist of thirty-one members, nominated by the Prefect of the Seine, the Academy of Arts, the Chamber of Commerce, and the competitors. Reproductions of ancient signs are to be excluded from the competition.

**A Competition** has been held for a municipal hospital in Washington. Thirty-eight sets of plans were sent in. The following architects have been selected to enter the final competition:—Frank Miles Day & Bro., Philadelphia; D. Hale and George B. Degersdorff, of Boston; and S. R. Rutan & Coolidge, of Boston.

**M. Emile Molinier**, who was until recently one of the conservators of the Louvre, is about to take up his residence in London as the representative of a Paris picture dealer.

**The New Works Committee** of the London County Council will consist of Mr. E. A. Cornwall, Mr. L. Shaw, Mr. Edward Smith, Mr. A. M. Torrance, Lord Welby, Mr. Ward and Mr. P. S. Waterlow.

**Mr. F. Vigers** has been appointed to carry out the Coronation decoration of the city of Westminster. He proposes the employment of Venetian masts along the greater part of the route, with wreaths besides triumphal arches, representing Great Britain and Ireland, India, Canada, Australia and Africa.

**The Salary** of Mr. Andrew Young, valuer to the County Council, was increased on Tuesday to 2,000*l.* a year.

**At a Meeting** of the Royal Scottish Academy at Edinburgh on Wednesday the following were elected Associates: Messrs. Robert Burns (Edinburgh), C. H. Mackie (Edinburgh), Edwin Alexander (Edinburgh), and James Cadenhead (Edinburgh), painters; and A. Macfarlane Shannon (Glasgow), sculptor.

**A Statue** of the late Queen Victoria, by Mr. Frampton, A.R.A., was unveiled in Calcutta by Lord Curzon on Wednesday.

**The Dean and Chapter of Ripon** have appealed from the order of the Court of Chancery to carry out works of reparation. The estimated amount is 3,000*l.*

**Excavations** just completed at Bourne End, on the site of the ancient abbey of Little Marlow, Bucks, have yielded a harvest to antiquaries. A stone coffin found under the transept contained two male skeletons, outside the lower part of an effigy of a knight in chain armour. In a niche of the infirmary was picked up a steel spur of a knight supposed to have ended his days in the institution. The hearth of the warming-house is still visible, and even the remains of a fire can be seen. Another interesting find has been made on the Castle Estate at High Wycombe, in the shape of an Anglo-Saxon gold pendant, marking the burial-place of a notable person.

**The Headmaster of Lancing College** has been given by an anonymous friend the sum of 10,000*l.* to be expended in preparing the chapel for immediate use. Over three times the sum is still required to complete the original scheme for the whole college.

## EDITORIAL NOTICES.

*view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*respondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## NOTICE.

*Friday being Good Friday, THE ARCHITECT will be published on Thursday. All Advertisements intended for this Number must reach the Office not later than 4 P.M. on Wednesday, March 26.*

## COMPETITIONS OPEN.

**ILKESTON.**—March 29.—Competitive plans are invited for proposed public offices, fire-station and town hall for the year 1902. Premiums of £100, £75 and £50 will be awarded for the first, second and third best plans. Mr. Nelson F. Dennis, I.C.E., surveyor.

**AUSTRALIA.**—May 1.—Designs are invited from sculptors for a memorial statue of Her late Majesty in marble or bronze. Information can be obtained at the office of the Agent-General for the State of Victoria, 15 Victoria Street, West Melbourne.

**ILKESTON.**—The free library committee of the Ilkerton Town Council invite drawings for the erection of public free library buildings in the Market Place and South Street. Premiums of 50*l.*, 25*l.* and 12*l.* 10*s.* will be awarded to the first, second and third selected designs. Mr. H. J. Kilford, borough surveyor, Town Hall, Ilkerton.

**IRELAND.**—April 21.—Prizes of 20*l.* and 10*l.* respectively will be awarded for the first and second schemes in order of merit for utilising to the best advantage a plot of ground acquired by the Council for the erection of about twenty-five workmen's houses in Coleraine. Mr. William Henry, clerk, Town Hall, Coleraine.

**LANGHO.**—April 4.—Competitive drawings are invited for buildings to be erected at Langho, near Blackburn, for the accommodation of the epileptics, imbeciles and idiots at present in the workhouses of the Chorlton Union and the township of Manchester. Premiums of 200*l.*, 150*l.* and 100*l.* respectively will be awarded. Lithographed plan of site, and copy of conditions and instructions, may be obtained by a written application only, addressed to the Clerk to the Joint Asylum Committee, Chorlton Union Offices, All Saints, Manchester.

**LIVERPOOL.**—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

**MEXBOROUGH.**—May 1.—The committee of the Mexborough Montagu Hospital invite plans for the erection of an accident hospital for both sexes, for the treatment of thirty patients, with the needful nurses and servants' accommodation. Premiums of 25*l.* and 10*l.* are offered, the premium awarded to merge in the commission. Mr. C. Brumpton, secretary, Fern Villa, Mexborough, near Rotherham, Yorkshire.

**NEW SOUTH WALES.**—March 31.—Designs are invited for a bridge across Sydney Harbour. Mr. H. Copeland, 9 Victoria Street, S.W.

**OLDHAM.**—April 8.—Competitive drawings are invited for erection of new market hall and shops in Albion Street and Henshaw Street. Premiums will be awarded to the authors of the three selected designs, viz. 50*l.* for the design placed first, 30*l.* for the design placed second, and 20*l.* for the design placed third. Mr. S. A. Pickering, borough surveyor, Oldham.

**SUNDERLAND.**—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100*l.*, 50*l.* and 25*l.* are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

**YORK.**—May 1.—Designs are invited for a Memorial to the late Queen Victoria to be placed in the Guildhall, York. The design must include a representation of Her Majesty, and be accompanied by an estimate of the cost of the work complete, such cost not to exceed 1,000*l.* A prize of 50*l.* (to merge in the commission) will be given for the accepted design. Mr. W. H. Andrews, town clerk, Guildhall, York.

## CONTRACTS OPEN.

**AMBLE.**—March 25.—For erection of a club at Amble. Mr. George Reavell, jun., architect, Alnwick.

**ASHINGTON.**—April 2.—For erection of a Presbyterian manse at Ashington. Mr. Osborne Blythe, architect, Market Place, Morpeth.

**BARROW-IN-FURNESS.**—March 24.—For construction of lavatories, &c., at the old town hall. The Town Clerk, Town Hall, Barrow.

Bassett v. Adamant Company, Ltd.

SIR,—Referring to above case reported in the daily papers of Saturday last, we should be glad if you will kindly allow us to state that we have no connection whatever with the plaintiff or defendants in the action, as, owing to the somewhat similar names, viz. *Adamant* and *Adamantine*, the public might perhaps think that we may be in some manner connected with the case.—We are, dear Sir, yours truly,

G. M. RESTALL &amp; SON,

Adamantine Plaster Manufacturers.

Soho Pool Wharf, Birmingham :

March 19, 1902.

## ELECTRIC NOTES.

THE Margate Corporation have provisionally agreed to construct an electric lift connecting the Marina with the Victoria Parade.

FLADBURY, a Worcestershire hamlet of 425 inhabitants, is electrically lighted by means of two water turbines, which derive their power from the Avon. Seven public electric lamps brighten the village street, and 280 private-house lamps are in use. The whole working expense is about 70*l.* a year, and the revenue about 120*l.*

ONE of the largest blasting operations ever witnessed at the Swell Tor Quarries, Princetown, Devon, has just taken place. The powder was fired by a network of electrical wires. When the arrangements had all been completed every one was removed out of danger. A slight wait ensued, and then there was a long roll as of thunder, a blaze of fire, and many hundreds of tons of stone went crashing into the quarry. One stone measured 23 feet long by 9 feet wide and 8 feet deep.

THE Hove Town Council had recently before them a report advising the purchase by the Corporation of the tramway now running between Hove and Shoreham, and the working of it in future by electricity. Four routes were also suggested for the municipal tramways it is proposed to lay down. The sea-front was omitted from the scheme, it not being deemed desirable to have a tramway in that position. The other routes extended over a distance of four and three-quarter miles, starting from the Brighton boundary, and going westwards and northwards. Nearly all the length would be a double track.

The cost of permanent way and overhead electric equipment was estimated at 85,000*l.* The subject is to be further considered at a special meeting.

A COMMITTEE of the House of Commons, of which Mr. Welby was the chairman, last week found the preamble of the Kent Electric Power Bill proved. The object of the Bill is to supply electric power in the administrative part of the County of Kent, and it is anticipated that it will afford assistance to local authorities in carrying out provisional orders. It is a good deal of power will be required for electric light railways, and the numerous manufactures in the County are looked to to provide a considerable revenue. Generating stations are to be erected at Canterbury, Tonbridge, and Rochester, a proposed fourth at Dover having been abandoned owing to opposition. Mr. S. Z. Ferranti, electrical engineer, gave evidence in support of the Bill, stating that the normal price was 4*d.* per Board of Trade unit, with a sliding scale down to 3*d.* per unit. There was no opposition.

At a meeting of the tramway committee of Dundee Council the electrical engineer submitted a report on proposed additions to the plant at the electric station. His report it appeared that the existing plant was equivalent to 3,770 horse-power. During the past winter the quantity of electricity required to supply the demands of the Corporation was equal to 2,556 horse-power, while next winter it was estimated that 3,368 horse-power would be needed. The pressure on the return feeders allowed by the Board of Trade had been reached, and it would now be necessary to instal boosters. He therefore recommended the purchase of one 750 kilowatt engine and dynamo at a total cost of 6,000*l.*; two 600 horse-power tubular boilers fitted with mechanical stokers and force draught apparatus for burning cheap fuel, at 200*l.*; and boosters and switches at 1,000*l.*—in all, 9,000*l.* Bailie Robertson suggested that the committee might have a report from an expert on the electric supply in order to ascertain if they were getting all the possible from the present plant. He was supported by Mr. High. The convener (Mr. Brownlee) pointed out that in the report by the engineer it appeared that they were working the machinery at more than its recognised capacity. He also pointed out that the demands for tramway and light railways were increasing, and that by next winter there would be too narrow a margin to work upon. It was finally agreed to approve of the engineer's report.

## TRADE NOTES.

A new police station at Prestatyn has been fitted with well-known "small tube" hot water heating apparatus by Messrs. John King, Ltd., engineers, Liverpool.

THE Westbrook Temporary Hospital, Herne Bay, is being heated and ventilated by means of Shorland's patent Mantel stoves and special inlet tubes, supplied by Messrs. L. Shorland & Brother, of Manchester.

MESSRS. COUSLAND & MACKAY, ventilating engineers, Glasgow and Manchester, are at present carrying out the ventilation of the Minehead Baptist chapel, Minehead, by means of Mackay's direct-acting ventilators, of which they are the sole agents.

HAT His Majesty has decided not to go abroad, but to spend his holiday yachting round the British coasts, is as it should be, and will be much appreciated by the people of the most seafaring nation in the world, and give an impetus to yachting. In spite of all that has been said about the new yacht, there is no doubt that she is not only thoroughly worthy, but probably is the finest yacht in the world, and is also in the matter of fireproof construction, non-flammable having been used almost throughout.

AMONGST the recent improvements at Windsor Castle was the installation of a "Teba" auto-geyser, made by Maughan's Hot Water Geyser Company, Ltd., for the purpose of supplying hot water to the King's bath. This apparatus is fitted in an airing lobby, the gas and cold water supplies being automatically opened and closed by the turning on or off of the hot-

water tap to the bath. The principle on which the "Teba" auto-geyser works is as follows:—The opening of any hot-water tap draws hot water from the auto-geyser. Fresh cold water enters through a ball valve. This lifts a float which opens a full supply of gas. The cold water is heated in passing through the auto-geyser, and an unlimited quantity can be drawn. When the tap is closed the apparatus fills and the ball valve shuts off the supply. The float then falls, shutting off the gas to pilot light, which serves to maintain the heat of the contained water, and to relight the burner when again used. There is, accordingly, practically no expense for fuel except when hot water is being drawn, an obvious economy as compared with the kitchen-boiler system.

## VARIETIES.

NEW Church schools have been opened in Waterloo Road, Lambeth. The building provides accommodation for 900 children.

Messrs. Hill & Smith's premises, Janus Works, Queen's Road, Battersea, were the scene of a serious outbreak of fire yesterday (Thursday) morning.

MR. ROBERT BRYCE WALKER has been elected town clerk of Pollokshaws, in the room of Mr. John Campbell, resigned.

A NEW church and Sunday school, which has been erected at Beeston Hill, Yorks, from the designs of Mr. G. W. Smithson, of Leeds, at a cost of 3,049*l.*, exclusive of the cost of site, was opened on the 15th inst.

THE new porch which has been erected at the south-eastern door of Holy Trinity Church, Shrewsbury, at a cost of 200*l.*, was formally dedicated by the Bishop of Shrewsbury at the evening service on Sunday, the 9th inst.

ST. MARY'S CHURCH, Send, Surrey, has been repaved, the old stone paving, which was greatly worn, having been replaced by wood blocks. All the old tombs have been sealed down, and the chancel has been paved with white marble, the gift of the Earl of Onslow. The exterior of the church windows has also been restored. The work has been carried out by Messrs. Harris & Son, of Woking.

THE new municipal hall, public library and technical schools erected by the Corporation of Colne, Lancs, at a cost of 10,000*l.*, were opened on Saturday afternoon. The buildings have a main frontage to Albert Road, the principal thorough-

fare of the town. The public hall (which will seat 1,000 persons) and library are approached by the elevation to Albert Road, and the technical schools occupy the rear portion of the building, which has a commanding site and is erected from the designs of Messrs Woodhouse & Willoughby, architects, of Manchester.

NOTWITHSTANDING the excellent booking for "Made-moiselle Mars," Mrs. Langtry has decided to take a rest during Holy Week, and her elegant theatre will therefore remain closed from to-morrow until the following Saturday, the 29th inst.

THE last of the monthly meetings of the Manchester Society of Architects was held on the 13th inst., when the students' drawings, over fifty in number, were on exhibition. The president, Mr. Alfred Darbyshire, presented the prizes to the successful students, and Mr. Isaac Taylor, taking the drawings one by one, gave each a brief criticism. The winners for the design for a gatehouse were, in the senior class of design, Mr. J. T. W. Brooke, and in the junior Mr. G. F. Ely, special second prizes being also awarded to Mr. C. Paterson and Mr. Harold Hill. Mr. Holden's prize for an art gallery was awarded to Mr. P. A. Horrocks.

A NEW isolation hospital for Rhondda, Wales, was opened on the 13th inst. The building, which is on the most modern lines, is situated at the junction of Penrhys Road and Hospital Road, Ystrad Rhondda, thus being placed in a central position with regard to the Council's area. The hospital is composed of seven blocks of buildings, viz the administrative block, scarlet-fever pavilions, typhoid pavilions, laundry and disinfecting block, mortuary, discharging block and stable. The whole structure is of local stone, surrounded by a wall, and within the enclosure is ample room for extension of the hospital. Accommodation is provided for 32 patients. The cost amounted to £13,385. The plans were prepared by Mr. W. D. Morgan, architect, Ton, who was successful amongst 10 competing architects.

A CURIOUS development has taken place in connection with the Rothesay town-clerkship, Mr. James Carse having refused to quit the office premises. He contends that the scope of the petition, in favour of which an interlocutor has been sent from the Court of Session, is not wide enough. He holds that under the terms of that petition Mr. R. D. Whyte, the interim town clerk, can only act under the Burgh Police (Scotland) Act, 1892, Roads and Bridges, Public Health and Electric Lighting Acts, also Rothesay Harbour Act and Orders.

He says that there are many duties outwith these which not covered by the petition, such as licenses and the keeping of the Register of Sasines. On the other hand, it is contended that the petition is perfectly explicit, for after specifying the duties it goes on to say, "And all the other duties pertaining to the office of town clerk." Provost M'Intosh has communicated with the burgh's legal advisers.

IMPORTANT additions to the Birkenhead Institute have just been completed, and greatly enhance the appearance as well as increase the accommodation of the building. These comprise a fine entrance hall, with cloakroom accommodation, and classroom, 24 feet 6 inches by 22 feet, on the ground floor. The first floor is an extension of the science department in the shape of a physical laboratory equipped with specially designed benches and fittings according to the most modern and approved ideas for instruction in this important branch of science. Attached to this physics laboratory are a workshop and dark room for special optical experiments. The whole of the buildings now form a most complete establishment for educational purposes, and, viewed from the standpoint of efficiency, would be difficult to improve. All the rooms are well lighted on modern principles. Scientific education is provided for on a lavish scale. The façade to Whetstone Lane is of white Stourton stone, "so faced," with dressed quoins and moulded window jambs. The gables at each end are dignified and expressive of the purpose of the building. The main entrance is of Classical design, which feeling dominates the whole front, but treatment is free, to admit of adaptation to modern requirements. The buildings from the commencement have been designed and erected under the superintendence of the architects to the Birkenhead Institute Company, Messrs. T. M. Reade & Son, Liverpool. The contractor for the present additions is Mr. Charles Burt, of Liverpool.

#### BUILDING AND BUILDERS.

It is proposed to enlarge St. George's Church, Wolverhampton, Bucks, at a cost of £1,400, or £1,500.

OBAN is to have a new post office, and a plot of land adjoining the railway station is about to be acquired for it.

THE Associated Carpenters and Joiners' Society held a soirée and assembly in the Co-operative Hall, Dunfermline, Friday evening. Provost Scobie presided.

AUSTIN'S

NEW IMPERIAL PATENT

SUPERFINE FLAX

The above article is now being manufactured in large quantities for Greenhouse Sashes, Public-houses and other heavy work. The Manufacturers would like to draw the trade to their Imperial Patent Flax Sash Linings, they are now making six qualities, all of which are strongly recommended, as they have given unqualified approval to the trade for now over One Hundred Years. Proprietors continue to give their personal attention to the manufacture of these goods.

AUSTIN'S IMPERIAL PATENT FLAX SASH LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the trade to their Imperial Patent Flax Sash Linings, they are now making six qualities, all of which are strongly recommended, as they have given unqualified approval to the trade for now over One Hundred Years. Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of their IMPERIAL PATENT BLIND LINES, which are superior to anything yet offered.

They can be obtained of all Rope-makers, Iron Merchants, Factors and Wholesale Houses in the Country.

N.B.—Please note that all our goods, as advertised, are labelled either inside or outside with our Trade Mark "The Anchor."

THE Latest and most Complete Lists of Building and the Lists of Tenders received are given week in the pages of this Journal.

The Subscription, including postage, is only 10/- per annum, or 10/- for six months; or you can obtain your newsagent for 4d. per week.

Published EVERY FRIDAY by GILBERT W. LTD., at the Offices, 6-11 Imperial Building, Circus, London, E.C.

ANS have been passed for the erection at Coatbridge by the Monkland School Board of a new elementary school which will accommodate 720. The building is estimated to cost

a meeting of the committee charged with the administration of the money to be provided by Mr. Andrew Carnegie for new baths and gymnasium for Dunfermline, tenders accepted to the amount of 27,057*l*. The sum originally estimated was 20,000*l*.

The sanction of the Local Government Board has been given by the Margate Corporation for the expenditure of 700,000*l* upon works of sea defence. The plan includes the construction of artistic shelters and easy paths along the face of the east cliff.

LONDONDERRY builder and contractor named Malseed threw himself in front of a passenger train at a level crossing on the Lough Swilly Railway and was instantly killed. His head and feet being severed. Deceased had only been released a short time ago from a lunatic asylum.

The Halifax licensing justices inspected last week the plans for the proposed Palace Theatre to be erected at Ward's Quay, Halifax. Mr. E. Rüntz, architect, explained the plans. The scheme will involve an outlay of 30,000*l*. or 40,000*l*., as the case may be, and is to be well planned and up to date.

A CREMATORIUM is being erected at Golder's Green, near Hampstead. The structural part includes a chapel, waiting-attendant's lodge, cloisters and suitable structures for the burning of urns and the keeping of memorial tablets. The crematorium adjoins the terminus of the proposed Hampstead and High Cross Electric Railway.

At a meeting of the Bromsgrove, Droitwich and Redditch Local Committee last week, the clerk reported that 9,806*l*. had already been expended on the hospital buildings that will be opened at Hill Top, and he estimated that a further 3,496*l*. would have to be paid. On the whole work he estimated that the expenditure would exceed the architect's fee by 3,707*l*.

A committee of the Lancashire and Cheshire Congregational Chapel and School Building Society have voted the following sums:—A grant of 250*l*. for a new school at Oxtun, near Leeds; a grant of 200*l*. and a loan of 300*l*. for a new school at St. Paul's, Wigan; a grant of 150*l*. and a loan of 200*l*. for a new school at Garstang; and a grant of 500*l*. and a loan of 300*l*. for a new chapel at Broadheath, Altrincham.

A STEEPLEJACK, named Jones, who was at work on a shaft at Messrs. Knowles & Co.'s sanitary ware premises, Woodville, Burton-on-Trent, on Tuesday morning, fell a distance of 60 feet into a channel below. Those who witnessed the occurrence quite anticipated that Jones was killed outright, but when taken to the infirmary it was found that although he was severely injured, his case was anything but a hopeless one. He had sustained a fracture of both ankles, and of one or two ribs.

THE master masons of Arbroath have had under consideration a request by the men to increase the rate of wages from 8*d*. as at present to 8½*d*. per hour; also to allow the men to cease work at noon on Saturdays during the winter months instead of one o'clock as at present; to grant an extra ½*d*. per hour on jobs outside the burgh boundary up to two miles distant and 1*d*. beyond two miles. The masters have declined to entertain the request on the ground that the present state of the building trade does not warrant any alteration in the existing arrangements.

THE construction of the new railway bridge over the river Tyne at Newcastle, the contract for which has been let to the Cleveland Bridge and Engineering Company, Ltd., Darlington, is the largest undertaking of the kind which has been started in the United Kingdom since the completion of the Forth Bridge. The engineer's estimate of the cost of the bridge was 470,000*l*., but it is understood that the contract has been placed at something under this amount. The new bridge will not supersede the existing high-level bridge at Newcastle, but will supplement it, the congestion of traffic at the point making another bridge necessary. It will cross the river more than a third of a mile higher up the stream than the present bridge.

AN interesting event took place at the Queen's hotel, Leeds, on the 7th inst., when Messrs. W. Nicholson & Son, builders and contractors, invited their staff and a few friends to a complimentary dinner given to their oldest foreman (Mr. William Sutcliffe) who had that day served fifty years with the firm, commencing with the grandfather of the present Mr. William Nicholson. After the dinner Mr. Sutcliffe was presented by the firm with a life-size portrait of himself, a dining-room clock and a purse containing 125*l*. Mr. Nicholson, in a pleasant little address, stated that Mr. Sutcliffe had not been away from his work, either from illness or holidays, one week in ten years, or five weeks during the whole fifty years, and his services had been continuous in spite of strikes and lock-outs over

# UNION PLATE GLASS CO., LTD., POCKET NOOK, ST. HELENS.

Trams, "Union, St. Helens." Nat. Tel. 48.

ESTABLISHED 1837.

Makers of Ground, Smoothed, Polished, Silvered, Bevelled, Brilliant Cut, and Bent Plate Glass; Rough Rolled and Rough Cast Plate Glass; also of Rough and Polished Prismatic Glass, &c., &c.

the whole period; in fact, he was an example of faithfulness, honesty, sobriety and energy. He was glad to say Mr. Sutcliffe was not going to retire. Mr. Sutcliffe in returning thanks said that he had achieved that day what he had set his mind on forty-two years ago. Mr. H. S. Atkinson, the general manager, in proposing the health of the firm, gave a list of many of the difficult tasks carried out so well by Mr. W. Sutcliffe.

A FURTHER step has been taken towards the realisation of Birmingham's Rowton House scheme. The contract for the purchase of a site for the new house having now been signed, building operations will shortly be in active progress. The site is situated at the corner of Moseley and Alcester Streets, with a frontage of over 80 yards to the former, and of 53 yards to the latter thoroughfare. It lies high, and quite an exceptional feature is that it adjoins Highgate Park. Its frontage to the park is about the same as to Moseley Street, and thus one side of the house will overlook a large open space and will have a southern aspect, so that a copious supply of sunlight and fresh air is assured. Another feature of the site is its proximity to the centre of the town. It adjoins the Moseley Street police and fire-brigade stations, is within a minute's walk of the Moseley tram route, three minutes' walk of the Small Heath tram route, about five minutes' walk of the new dead-meat market and the other public markets, and is close to the lodging-house district of the city. It is considered by Lord Rowton and all the officials of the London Rowton Houses to be the most eligible site they have ever seen offered for the erection of a Rowton House, and the enterprise is to be congratulated upon such an excellent acquisition. The

land is being surveyed, and, as stated, building operations will shortly be commenced. The directors, after carefully into the cost of the building and considering income which will be derived from the provision of a number of cubicles, have been induced to favourably consider the erection of a larger house than was originally contemplated and that in all probability a house capable of finding room for 800 persons will be erected. Plans have already been prepared, and as the site stands so high, and lends itself to architectural treatment, the building will be a handsome addition to the public buildings of the city.

### TURNERS' FIREPROOF FLOORING.

THE Turner patent tubular fireproof flooring is composed of Mr. J. H. Turner's (of Messrs. P. & W. MacLellan & Co., Glasgow) patent triple-flanged rolled steel joist as tension member and a patent composition or fireclay double the special form, having lugs at the sides to support the between the said triple-flanged joists, until the fine fill composition surrounding the lower parts of the joists, effectually isolates the joists from any contact with fire heat, has set, and the superposed concrete has been laid forming altogether a level-surfaced homogeneous mass of concrete, on which the wooden or other flooring may be laid in the ordinary way. The tubular tiles, as shown in illustration, are keyed on the under surface for the ceiling. The whole design of this construction is based on the practical experience gained in actual and severe ware

er fires, and possesses the advantages of lightness and with exceptional strength and rapidity and facility of action, while all severe impact by falling debris during fire is effectually provided for. It is being placed on the market by Messrs. P. & W. MacLellan, Ltd., of Glasgow, and its reputation in roof, bridge, and structural work generally is well known. It has been approved and adopted by the Corporation of Glasgow on the advice of their architects, Messrs. James & R. D. Sandilands, and the City engineer, Mr. Macdonald, C.E., M.Inst.C.E., for their Bell Street, Street, Trongate and High Street improvements; also by the Glasgow Parish Council for their Western District on the advice of their architect, Mr. Alexander Cullen, A.A., Brandon Chambers, Hamilton. This construction has been subjected to the keenest criticism, and was favourably reported upon by large numbers of practical experts from all over the world when shown at the recent Glasgow International Exhibition.

#### ARTISTIC ELECTRIC ILLUMINATIONS.\*

Subject selected for discussion this evening is, no doubt, one eminently appropriate to a time when many of our citizens are thinking of showing their loyalty by a display of illumination devices on the fronts of their houses of business or at their private residences. How I, however, have come to the honour of being selected to discuss this subject I really do not know, inasmuch as I had never before spoken on anything relating to the artistic side of electricity, much less to any question of decorative art, but have generally limited myself to questions of technical and constructive importance.

My selection has something to do with the fact that many curious coincidences, I have, during my travels and recent visits abroad, seen much of illuminations on many occasions, and that I am able to tell you something of the doings in countries which, I may almost say, are "in the process of demonstrating their loyalty or joy by illuminations."

It may be, however, that I have been called upon to speak on this subject, as an amateur, takes considerable interest in

paper read by Edwin O. Sachs, architect, A.M.I.Mech.E., before the Society for the Encouragement of the

electric lighting and stage lighting, and the lighting of public buildings in particular, and who, in a sordid moment, having assisted in the development of a certain electrical system and certain electrical devices, had the impertinence to interest himself financially in what I believe may shortly revolutionise the whole problem of rapid and artistic electrical illumination. I here refer to my association with what is generally known as the E.L.B. system of electric lighting, brought out by a company trading under the name of Electric Lighting Boards.

Whatever the actual reason may have been, I will approach the subject to-night, firstly, as an architect; secondly, as one who has travelled; and thirdly, as one who believes (rightly or wrongly) that there is now at least some means of economically and rapidly employing electricity for special temporary effects in an artistic manner, and also a system which will far supersede everything that has been done before, and more particularly supersede the ugly gas-flare and the hideous gas-jet that have been used in the Metropolis, until we are not only tired of their vulgar presence, but will only too gladly abandon them for all time.

As an architect, I mainly look upon electrical illuminations as a simple and rapid manner of outlining the façades of public buildings, marking the important features of public thoroughfares, and generally applying the principles of architectural design in showing up the features of a building or thoroughfare by artificial light.

As a traveller—and I may say that I know every European capital and many of the minor towns, and have attended in some form or other many of the great ceremonies of the past decade, not only near by in Paris, Berlin or Vienna, but also in the more distant St. Petersburg, Warsaw or Stockholm—I must draw attention to the fact that, with few memorable exceptions (notably last year at the Glasgow Exhibition), we are really behind the rest of the world in our attempts at illuminations.

As an amateur electrician and one who, when attempting to design effective decorative schemes in electrical work, has frequently met with difficulties of execution and expense, I speak to-night as one who believes that, with the new E.L.B. system which I have helped to nurse these difficulties have at last been surmounted.

I am not going to trouble you with a lot of historical detail as to the evolution of electrical illuminations or of illuminations generally, for I believe an audience such as I see before me would rather hear something relating to the practical applica-

at our Showrooms.

DREW WILSON writes as follows:—"The 'Tubor' Filters sold by the Berkefeld Filter Co., Limited, London, W., remove all germs from water. They therefore represent ideal filters, giving pure (i.e. germless) water, and thus prevent Typhoid and many other diseases"

tion of artistic electrical illumination than to the gradual evolution of the illumination schemes of to-day.

Nevertheless, I cannot but remind you that this whole question of artistic illumination is one of very, very long standing, and anyone acquainted with history will know how the great Roman emperors, and before them the Greeks, and before them again the Egyptians, on occasions of great rejoicing, would at night arrange special displays of artificial lighting. Such illuminations have also found a place in many of the great religious ceremonies that have been brought down to us from century to century, and anyone to-day visiting Russia will remember how on special occasions of religious importance there are great displays, not only of illuminations, but also of fireworks.

The application of many small lights at night has, from time immemorial, been the means of expressing joy.

In Russia and in the Slav, Latin and Teutonic countries, illuminations have always been much favoured during the last three centuries, and anyone coming across old prints will frequently find illustrations showing what was done at the time. I myself recently came across a print showing how the historical buildings of Nuremberg were illuminated on May 13, 1774, in a manner that would make us envious, although we now have electric light, and in those times they used only small oil lamps.

But I will not enter into any detailed description of the various illumination appliances utilised prior to the introduction of electric light, yet I must just touch on some of them.

The small earthenware pan, for instance, filled with tallow and a wick, was an appliance used for a very considerable period.

Candle illumination devices, protected by lamp-shades, either of glass or some other semi-transparent material, were popular illumination appliances for many years.

Then we have had the various forms of small lanterns made of metal, and the innumerable paper appliances generally described as Chinese lanterns. Of course, these Chinese lanterns were originally intended and are still intended in the main to be used with candles. They are quite unsuitable for gas, but, on the other hand, they are used with considerable effect as a covering for electric lights. Again, if we go to a country like Italy, we shall find the application of water plays a considerable part in the illumination appliances. Thus you will find glasses filled with water on which a kind of night-light is floating, and the light throwing its rays through the

water makes a charming effect. As a matter of fact, the water thus used is frequently coloured. Another illumination appliance, originally intended to be used with candlelight or with oil lamps, is transparency, which, nowadays, is also used with gaslight or electric light, being to simply draw the illumination device on a semi-transparent material behind which lights are placed in order to show up the device in question.

But, before leaving candlelight, perhaps I should say that the most wonderful effect that I have ever seen in the application of candles was at the celebration of the birthday of William I.'s eightieth birthday at Berlin when, in the arrangement, the entire city of Berlin placed six candles on the lower sill of every window in a row, there was not a window in the whole city of Berlin that did not get its row of lights in practically an identical manner. Even in the slums the candles were provided gratis by the city subscription, and similarly landlords having unlet houses not wishing to spend money on these unlet houses provided with candles. I consider that a simply of effect of this description, arranged with the most plain materials, but arranged simultaneously by a community of some one million souls in buildings covering many miles, was the most effective and impressive form of illumination that has ever been or is ever likely to be seen, and it utterly eclipses individual efforts to shine. What, may I ask, would the effect have been if, instead of candles in windows, the citizens could have arranged plain lines of electric light along the fronts of the buildings?

Turning back, however, to gaslight, we, in the first instance, find the various forms of partially outlining buildings, and the varying of devices and the like in plain gas-piping, with holes bored into the piping equally spaced, from which the light is given. Such outlining with plain, simple gaslights is not so effective if the idea of a really plain outline is retained, as a matter of fact, too much ambition has been shown in the view of making pretty devices, and ugliness as a result. These plain punctured lights are particularly well utilised for letters or emblems. The only device I know of these plain gas-burners that is in any way artistically successful is the star, owing to its simply being a number of plain lines meeting in one centre; but the star is comparatively rare.

The next form of this plain gas outlining is a device obtained by the application of a small burner, which does not, to any extent improve matters.

next step is the application of a small glass globe  
e burner, the glass globe frequently being coloured.  
means gas can certainly be made an effective illuminant  
s plain, straight work is done; but here, again, the  
decorative devices are used I do not consider the  
all good. In fact, it is most tawdry, as many will  
r who saw the last jubilee illuminations at the Bank  
sion House.

, as far as gas is concerned, comes the very popular  
on of ordinary gas-jets behind crystal emblems.  
Crystal emblems are essentially national, and are  
met with anywhere else outside England, and I must  
their application in certain directions can be made  
istic; but here, again, the moment simplicity is left  
icated designs, nothing but ugliness results.

leaving this question of gas illumination I should  
ce a walk I took down some of the main thorough-  
ne West End on the occasion of the King's birthday,  
r 9 last. I wish I had made my notes more detailed,  
no idea of this lecture impending, and I really only  
notes for my own private information.

(To be concluded.)

## NATIONAL PHYSICAL LABORATORY.

nesday the National Physical Laboratory at Ted-  
as formally opened by the Prince of Wales. The  
such an institution, says the *Times*, was mooted by  
in when president of the British Association, so far  
371. Professor Oliver Lodge, at the Cardiff meeting  
ars later, urged the importance of the scheme, and  
as Galton made it the subject of his presidential  
1895, when, in addition, he described a detailed  
efore the mathematical and physical section. A  
committee was then appointed by the Association, and  
ort, which was presented at Liverpool in 1896, it  
ed the facilities afforded by the Government, by the  
educational establishments, and by private societies  
ring the progress of science in Great Britain, and  
e peculiar kinds of work which might properly be  
n in the proposed institution. In consequence of  
t the British Association took a leading part  
z up an influentially-signed memorial to the

Government, with the result that a Treasury committee  
was appointed in 1897 to consider the question, the  
members being Lord Rayleigh (chairman), Sir Courte-  
nay Boyle, Sir John Wolfe-Barry, Sir W. C. Roberts-  
Austen, Mr. Robert Chalmers, Professor A. W. Rücker,  
Dr. Alexander Siemens and Dr. T. E. Thorpe. During the  
sittings, which lasted for about six months, a number of  
leading experts in the different branches of physical and  
mechanical science were examined, and in the report which  
was presented to Parliament in 1898 the opinion was  
unanimously expressed that a public institution should be  
founded for standardising and verifying instruments, for testing  
materials and for the determination of physical constants.  
Shortly afterwards the old Kew Observatory committee was  
wound up and its powers and properties were vested in a  
newly elected National Physical Laboratory committee, con-  
sisting of twenty-four Fellows of the Royal Society and two  
representatives from each of the following:—The Institutions  
of Mechanical, Civil and Electrical Engineers, the Institution  
of Naval Architects, the Iron and Steel Institute and the  
Society of Chemical Industry. These, with the president,  
treasurer and one of the secretaries of the Royal Society, and  
the Permanent Secretary to the Board of Trade, form the  
general committee, half of their number constituting the  
executive, which meets monthly to transact the business of the  
laboratory.

Almost the first business of the committee was the election  
of the director, to whom large administrative powers were  
delegated, and after much deliberation the post was offered to  
and accepted by Mr. R. J. Glazebrook, the recently-elected  
principal of University College, Liverpool. The first site pro-  
posed for the laboratory building was some part of the Old  
Deer Park at Richmond, near Kew Observatory, but for a  
variety of reasons this idea was abandoned, and the offer was  
made by the Government to assign to the Royal Society for  
the purposes of the laboratory the building and grounds of an  
old Royal residence—Bushy House—together with a grant of  
14,000*l.* for remodelling the building, and a maintenance  
allowance of 4,000*l.* a year. Although the house in many  
ways is not badly adapted for the purposes of a labora-  
tory, the task of transforming it and fitting it up with  
the necessary gas, water, drainage and electrical equip-  
ment was an extremely difficult one, much more difficult  
than that of designing a new building. The peculiar require-  
ments of certain branches of delicate physical research are in

Manufacturing Co., Ltd.  
Altrincham.

many cases far from easy of attainment, and great care had to be taken in arranging the different departments so that vibration or electrical or magnetic disturbance set up by one worker should have the least possible effect upon the others. In Bushy House—the physical laboratory proper—it was not found necessary to make any extensive structural alterations, and except for the relaying of the basement with concrete and the provision of an entirely new drainage system the fabric remains much as it was. An extensive additional building has, however, been provided alongside the old laundries, to accommodate the mechanical or engineering department. The chief part of this building consists of two spans on the lines of a weaving-shed, with glass roof carried by iron pillars, and it is arranged so as to be capable of extension without difficulty by the successive addition of new spans. Adjoining this engineering shop is a power-house with a 60-kilowatt Parsons turbo-generator, worked from a Lancashire boiler, which also supplies steam for heating the whole of the buildings on a low-pressure radiator system. A gas-engine and dynamo giving 12 kilowatts serve as a stand-by and smaller source of power when the turbine is not needed. An interesting feature is the experimental wiring, which has been mainly designed by the director, in consultation with Mr. G. A. Steenthal, of Bradford. The system adopted is that of bare wire run on porcelain insulators, a plan which has proved satisfactory in the new physical laboratory at Owens College, Manchester. From the main switchboard and four subsidiary boards circuits are led to almost every room in the building, and to these any voltage from 2 to 150 may be applied by making the appropriate connections.

The general scheme of the building is such that the main departments occupy the principal rooms in four of the wings, along with the portions of the basement most nearly adjoining, while the first floor and a number of small rooms in the central north wing are general laboratories. The three departments having the most extensive special accommodation are electricity, thermometry and chemistry. The chief electrical rooms are in the south-east corner—the old library and dining-room respectively. In the latter all iron has been removed from the structural work and the fittings have been arranged to be as non-magnetic as possible, so as to admit of experiments requiring a uniform and undisturbed earth's field. It may be interesting in this connection to mention that the near proximity of an old cannon, serving as a support for a lamp in the garden, was found by experiment to render

futile the labour spent in keeping away iron from the internal work of this room. This cannon and its fellows have since been moved some distance away in the ground. The electrical department will undertake the verification of electrical instruments as are not provided for at present. The Board of Trade, together with tests of the electrical properties of the materials used in trade, such as the conductivity of wires or electric arc carbons, or the insulation resistance of different dielectrics used in cable-making. The classical Association standards of resistance used by Jenkin and others are installed in a special room in the basement.

Chemistry is accommodated in the south-west portion of the chief laboratory having been formerly the chapel. A room in the basement has been fitted as a metal laboratory with furnaces and hearths, but the equipment of this department with the necessary apparatus has been postponed for the present for lack of funds. A very complete outfit has, however, been provided for investigation of the structure of metals by microphotography, and it is that the work of the alloys research committee of the Institution of Mechanical Engineers will be continued in this laboratory. The department of thermometry is placed in the north-west portion of the building. The main room is fitted with the latest forms of apparatus for the measurement of temperature up to the highest limits in industrial processes. The fundamental standard temperature scale chosen by the International Committee of Weights and Measures is that of the hydrogen thermometer. Andrew Noble has presented to the laboratory a thermometer for use up to high temperatures, to serve as a provisional standard. In addition, the department possesses equipment of Callendar & Griffiths's electrical resistance thermometers, some of which have been directly compared with the international standards over a wide range. A complete apparatus has also been provided for the measurement of temperature by means of thermojunctions, such as were employed by the late Professor Tait, and have been recently perfected in France and Germany. A range of combustion baths for temperatures extending from the boiling point of liquid air to the melting-point of gold is nearly complete, those for the higher temperatures being heated electrically. The Department hopes soon to be in a position to possess thermometers of all kinds, embracing any part of this range.

In other departments there is provided an elaborate engine, a Whitworth measuring machine, a Pratt &

ing machine and a comparator. A mercury column high permits the direct measurement of moderate pressures, and the calibration of pressure gauges up to the limits is provided for in the engineering laboratory. Also, a small testing-machine is fitted, and the provision of a much larger one is in contemplation; but there is at present only a moderate equipment of machine-tools, and the purchase of several very necessary articles, such as milling and planing machines, is postponed for lack of funds. An optical method of testing with means of testing photographic lenses and with a photometer is under consideration.

## EXTENSIONS OF BANGALORE.

arely given us more pleasure, says *Indian Engineering*, to examine the plans of extension for Bangalore city. It is in a bold spirit of improvement they seem to provide every sanitary advantage. The areas which have been set out are situated in the north, south and west of the city. The one made was the Chamaragendrapet and occupies 120 acres. The main roads are 231 feet apart with a central lane of 15 feet between, thus allowing a depth of 100 feet for houses facing the main roads. There are five main roads and nine cross roads of 70 and 55 feet widths respectively. A frontage of 30 feet is reckoned as a unit, and one unit is permissible for a house site. Allotments of 1000 square feet have been made, which gives 5.26 houses per acre, calculating seven inmates per dwelling, thirty-seven per acre. A great feature of the drainage is that the sewer is separated from the sewage, the former being carried away by arched masonry oval drains and the latter by the sewage will be utilised on farms. The Bull Temple, or southern extension, is larger, and was made on the appearance of plague in the city. It covers 40 acres, and is in the form of a square with an open space of no less than 10 acres in the centre. There are four main roads which permit ready access to and from every part of the main thoroughfares are 100 feet wide, and are laid out with tram lines to run down their centre, and carriage traffic on the sides. The roadways are countersunk 3 feet, partly to protect the buildings, and partly to insure the houses from being damaged. As in the other extension, each row of houses has a foot wide behind it for drainage and conservancy, and

as these lanes are all connected the conservancy carts need not use any street or thoroughfare. This extension has been divided into eight blocks, each restricted to one of the principal castes. Retail bazaars are permitted along the diagonal roads only, and markets for grain, vegetables, meat and poultry have been provided for outside the suburb. The population is equal to a density of 31.8 per acre.

The northern or Malleswaram extension was started in 1898. It occupies an area of 300 acres. In this extension, which is occupied by Hindus, the main roads have been laid parallel with the meridian with the cross roads east and west, to allow houses to be built in the direction of the cardinal points. In the centre is a park. As in the southern extension, the leading roads will have trams along the centre with the carriage traffic on either side.

A few remarks must be made on the types of houses. For the mill hands and labourers there are blocks of houses built on sanitary principles. These houses are of two sizes, and will be available, either on a ten years' purchase system with payments of Rs. 7-12-0 and Rs. 1-9-0 per mensem, or for a monthly rental of Rs. 2-8-0 and Rs. 0-8-0 respectively. It is estimated that these rents will give a return of 3 per cent. on the outlay. The larger areas allotted to houses have permitted of types of houses being constructed suited to the official, trading and middle classes of Hindus.

These extensive improvements have necessarily cost money, but the expense has not been great, and it must be admitted that the money is well spent. The two latter or newer extensions are estimated to have cost 10,67,948 rs., but a part of this has been recouped from the sale of building sites. Considering the immense improvement and the very excellent way the various castes have been provided for, the expenditure is extremely moderate. For example, in the Malleswaram extension the Mohammedans have 109 house sites, the Hindus 204, the Brahmmins 349, the native Christians 50, and the Lingayats 150. These divisions are all united by cross roads. The number of houses on a given area has been distinctly limited, so that there shall not be overcrowding, the highest density of population not exceeding 37 persons per acre. In the papers to hand we are not told what provision has been made for water supply, privy or bathing accommodation, but of the plans for the extensions above described we can speak in the highest terms. This great scheme for Bangalore city is due to Mr. Standish Lee, sanitary engineer, Mysore Government. It is one that might well be copied by

other cities. Why should not the suburbs of every Indian city be planned out like those of American cities are, so that extensions should be made on well-conceived lines? At present improvements in the hearts of Indian cities only drive the people into the suburbs, where there is no provision made for them, and by degrees the suburbs become as insanitary as the central portions of the cities.

Where municipalities fail the Local Governments should step in. We are not sure that the Local Governments should not require every municipality in their respective provinces to furnish plans of extension of every city, and the plans approved, extension should only be permitted on those lines. Take Calcutta for example. Here we have great schemes of improvement of the bustis going on, but no thought has been given to extension of building in the suburbs. The consequence is that many of the suburban bustis are as unhealthy and crowded as those in the city area, and there is no order or regularity as to the fresh construction of dwellings. The suburbs ought to be plotted out, the lines of new roads marked out, and areas for huts delineated, so that as the population grows it shall not be permitted to crowd into closely-packed buildings. It goes without saying that all this ought to have been done long ago, but it is not too late to mend, and the example of Bangalore might be copied by every city in India.

### LIVERPOOL INSTITUTE.

THERE is excellent reason to believe, says the *Liverpool Courier*, that the erection of the Liverpool Cathedral on St. James's Mount will not be the only great improvement in that part of the city which will shortly be effected. The Liverpool Institute as it has grown in popularity and usefulness among the rising generations of inhabitants has found itself more and more cramped for space, especially for playground accommodation. This has been lately impressed upon the managing authority by reports to bodies such as the technical instruction committee of the Corporation.

We understand that a scheme was laid before the Liverpool health committee of an extensive, indeed ambitious, nature. A generous patron of the school has bought the remainder of the leases of the property between the school and Sandon Terrace, which faces St. James's Cemetery, and consequently close to the site chosen for the Liverpool Cathedral, and presented this

valuable block of property to the Institute for extension. At present a street—Back Mount Street—is between the school and Sandon Terrace, a row of stable opposite the school.

It is proposed that the Corporation, who are the freeholder, should supplement the private benefaction by granting the reversion conditional on the continued use of the property for educational purposes connected with the Institute, and also assist in supporting the necessary application for the right to close Back Mount Street. There is every reason to believe that the health committee are favourably disposed to the proposal, whose effect will ultimately be to greatly increase the area of the school building and adjoining grounds. The leases purchased have only a few years more to run, and the work of demolition will begin almost immediately. There are half a score of large houses in Sandon Terrace, which is in Upper Duke Street, and runs from Pilgrim Street to Sandon Terrace, and among the present tenants are the Deutscher Club, Beaconsfield Club, Liverpool School of Pharmacy, Liverpool Chemistry, Liverpool Union of Women Workers, Ladies' Sanitary Association, Association of Training women, and University Club. The frontage of Sandon Terrace opposite St. James's Cemetery, is nearly 100 feet.

It may be mentioned that this is the oldest existing secondary educational establishment in the city, having been founded as the Mechanics' Institution nearly seventy years ago, the first stone being laid by Lord Brougham in 1835.

### ELECTRICITY EXTENSIONS AT BOLTON.

COLONEL DURNFORD, R.E. (Local Government Board) made an inquiry on the 13th inst., at the Bolton Town Hall, as to the application of the Corporation for sanction to borrow money for purposes of electric lighting, &c. There were present Councillors Panton (chairman of the electricity committee), Jno. Berry, J.P. (vice-chairman) and S. Rothwell, Esq. (clerk (Mr. R. G. Hinnell), Mr. A. A. Day (electrical engineer), Mr. G. Swainson (borough treasurer) and Mr. G. T. (architect).

The principal objects of the proposed loan were as follows: For new buildings, 29,616*l.*, including extensions of house, new boiler-house, cooling tower, reservoir extension, storage buildings, new workshop, &c. For machinery, including engines and dynamos, 29,000*l.*; Lancashire

es and other apparatus, 24,705*l*. The sum of 22,550*l* part for extension of existing high and low tension connecting boxes, meters, sub-station and sub-station ard. It is interesting to note that the original cost of ricity works was 27,700*l*., and that of this amount a ess than 60*l* is now unaccounted for, 21,153*l*. having owed for depreciation, whilst there is still 962*l*. in The capital expenditure up to date is 175,000*l*.

own clerk, in opening the proceedings, showed that lation of the borough was 168,750, the area 15,283 d the rateable value for poor rate purposes 775,800*l*. as to outstanding loans on district rates showed that owing of 1,154,452*l*. had been sanctioned, that 997,248*l*. borrowed, 172,354*l*. had been repaid and the amount g was 824,693*l*. The amount already sanctioned for y purposes was 147,972*l*. (plus 50,000*l*. for the purposes e trams), and now 125,000*l*. was required for the a of the works which had been carried on at a profit ough.

led information regarding the necessary extensions a given by Mr. Day, the electrical engineer. The y included two 2,000 horse-power engines and two 1,200 amos; twenty 30 by 8 Lancashire boilers. steam pipes, ters, valves, mechanical stokers and shafting; hopper omiser with 4,000 pipes, switchboard extensions, con- achine cables for 2,400 k.w. generators, and sinking pump. Replying to the inspector, he said the demand r was largely increased, and there was every prospect ing at a still greater rate.

George Temperley, architect, produced the estimates s for the new buildings, the principal items being as -Extension to engine-house, new flues, manholes, er beds, &c., 5,060*l*; boiler-house, flues, cleaning out onomiser beds, dampers and boiler seatings, 10,863*l*; ower, 4,400*l*; reservoir extension, 1,375*l*; new work- veller and girders, 1,350*l*; new shed for cable drums, new tower foundations and roof round same, 1,250*l*; oor, stanchions, &c., 2,013*l*; and new boiler seatings, &c., 1,210*l*.

#### Encouraging Prediction by Councillor Panton.

illor Dr. Panton, chairman of the electricity com- id he had taken great interest in the works since mmencement in October, 1894, and he considered they a conducted in a very satisfactory manner. The

capital expenditure per 1,000 Board of Trade units was as follows:—

Year.	Amount.	Generated.	Sold.
	£	£	£
1896 . . . .	34,909	233	367
1897 . . . .	44,382	192	237
1898 . . . .	57,037	117	166
1899 . . . .	67,252	120	161
1900 . . . .	117,589	100	142
1901 . . . .	151,006	51	62

The average charge per unit was 5 84*d*. in 1895, and in 1901 it was 2 22*d*. In March of 1895 the consumers numbered 65, now they aggregated 1,053, and the number of candle-power lamps supplied had increased from 5,100 to 88,841. The number of motors now in use is 61. The following statement shows the gross profit and appropriation of same, with the amount voted in aid of the rates:—

Year ending	Gross Profits.	Interest on Loans.	Depreciation.
	£	£	£
1895 . . . .	945	956	580
1896 . . . .	794	1,013	834
1897 . . . .	2,296	1,295	1,103
1898 . . . .	3,160	1,443	1,410
1899 . . . .	4,536	1,598	1,731
1900 . . . .	5,902	2,439	2,012
1901 . . . .	10,554	3,815	5,881

Voted in aid of rates 1899, 1,000*l*; 1900, 1,000*l*; 1901, 887*l*. 18*s*. 1*d*.

When the extensions included in the present borrowing powers are carried out Bolton will have a capacity of 7,000 k.w., and the capital cost per k.w. will be 46*l* 2*s*. 9*d*., the lowest of the largest stations in the kingdom, Brighton coming next with 72*l*. 2*s*. and Edinburgh following with 73*l*. 4*s*. for 8,137 capacity. Councillor Panton ventured upon a prediction which will be hailed with a good deal of satisfaction. He prophesied that this year the cost of production would be one penny per Board of Trade unit, a reduction of 25 per cent. when compared with the 1 34*d*. last year. He further predicted that their output would prove to be 3,050,000, that the revenue would be 29,000*l*., and that the electricity committee would be able to devote 3,500*l*. to the relief of the rates, as against 857*l*. last year.

The inspector expressed satisfaction with the statement, and having satisfied himself that there was no opposition to

the scheme he closed the inquiry with an intimation that he would proceed to visit the electricity works and the site for the extensions.

### STEEL CHIMNEYS.

CHIMNEYS built of sheet steel are common, says the *Engineering Record*, particularly in Pennsylvania and the middle west. They may be either self-supporting or held in position by means of guy ropes. To save expense it is not unusual for a considerable number of small-guyed chimneys to be used in place of one large chimney. Steel chimneys are said to cost less than those built of brick, but the market price of steel affects their relative cost considerably. Any steel chimney should be carefully caulked at the joints and the vertical lap-joints scarfed at the girth-seams. The leakage of air that would otherwise occur and which unfortunately does occur in many cheaply-built steel chimneys very greatly affects the draught. Self-supporting steel chimneys rest usually on cast-iron base plates, sometimes cast in sections and bolted together if the chimney be large enough to make this desirable. The base-plate is held down by foundation-bolts built in a brick or concrete foundation sufficiently heavy to prevent the chimney from overturning. The lower courses of a self-supporting stack are usually flared out at the base of the chimney in a conical or bell shape to give stiffness to it, the height of this cone or bell being from  $1\frac{1}{2}$  to 2 times the diameter of the chimney above the bell and of a diameter at the base equal to the height of the bell.

A formula for determining the thickness of shell that is used by a firm which has built a large number of large self-supporting steel chimneys is as follows:—

$$\frac{\text{Moment in inch pounds}}{0.7845D^2} = \text{stress per lineal inch.}$$

This assumes that the moment of the total wind pressure in pounds multiplied into the distance in inches of the section under consideration from the centre of pressure, divided by the diameter of the chimney in inches squared multiplied by 0.7854, is equal to the maximum stress per lineal inch in the shell. The total wind-pressure is based on an assumed pressure of 25 lbs. per square foot of projected area. A safe working stress is 10,000 per square inch, and this should be reduced by the efficiency of the rivetted joint. If the efficiency of the rivetted joint is 60 per cent., then 6,000 pounds per lineal inch would be a safe working strength

and the ratio of the stress per lineal inch, as found by equation, to 6,000 would be the thickness in inches of shell required at the section under consideration. Calculate the thickness of the shell should be made at the base of the stack, the top of the bell and several points between the top. The greatest strain occurs at the top of the chimney on account of deterioration that is apt to occur in the upper part of the chimney. This is due to the fact that it is undesirable to use shells less than  $\frac{3}{8}$  to  $\frac{1}{2}$  inch in thickness depending upon the size of the chimney. This is particularly true near the top where the greatest corrosion is apt to occur owing to the effect of the smoke that usually clings to the side of a chimney.

For about one-fifth or one-quarter the height of a self-supporting chimney it is desirable that the girths be double-rivetted. The lower edge of any sheet usually used at the upper edge of the sheet beneath it. For the sake of greater stiffness, the vertical seams at the bell should be double-rivetted.

The foundations for self-supporting steel chimneys should have such a base that the load caused by the weight of the chimney and base and by the wind-pressure on the half of the base does not exceed the requirements of the foundation. The weight of the lining, if there be any, is to be included. The foundation must have sufficient mass, so that the weight of the wind-pressure into the height of the foundation, the height of the steel shell, shall be equal to the weight of the shell, plus the weight of the foundation, into one-half the length of the base of the foundation.

If P is the total wind-pressure, Ws the weight of the chimney, Wf the weight of the foundation, all in pounds, then if the conditions as to stability are fulfilled when

$$P\left(\frac{H}{2} + h\right) = (Ws + Wf)\frac{b}{3}$$

The wind-pressure can be obtained by calculation. The height of the foundation can be taken at from one-tenth the total height of the chimney. With the weight of the chimney and the weight of the stack being known, the weight of the foundation can be calculated. As concrete weighs 140 lbs. per cubic foot, the volume of the foundation can be determined, and from this the area of the top and bottom of the foundation can be determined. Should the wind-pressure be too great a load along the leeward edge of the foundations, a foundation of less depth can be assumed to insure one of greater area.

# The Architect.

## THE WEEK.

case FORD & Co. v. BEMROSE & SONS, LTD., lately came before the Court of Appeal, did not accord with the majority of those in which the accuracy of the bill of quantities is disputed. In the case in question there was an arbitrator of wide experience, Mr. ROBERT VIGERS, and the award was in favour of the plaintiffs; but the Court, consisting of the Master of the Rolls and Lords Justices of Appeal, and MATHEWS, came to the same conclusion as was established in *PRIESTLEY v. STONE*, *SCRIVENER v. BENTLEY*, &c. Messrs. FORD & Co. in 1895 entered into a contract to erect works in Derby in accordance with plans prepared by Mr. E. R. RIDGEWAY. There was a schedule of bills of quantities which was to apply to alterations or deviations from the progress of the work. Messrs. FORD agreed to complete the whole of the works required according to the plans and specifications for 10,559*l.* In April 1897 the works were completed. The architect gave a final certificate, showing that the balance owing was 1,530*l.* 13*s.* 5*d.* The contractors were dissatisfied, and sought to recover a larger sum. The Court left the arbitrator to decide on the following questions:—(1) Whether, in determining the value to be paid by Messrs. BEMROSE & Co. to Messrs. FORD, regard was to be had to the usage in the building trade. (2) Whether Messrs. FORD were entitled only to be paid the sum of 10,559*l.* mentioned in the contract, with deductions and additions as were by the contract to be made in respect of alterations or deviations from the original plans determined upon during the progress of the works. (3) Whether Messrs. FORD were to be paid the value of all the works actually done by them at the prices upon which the contract was made, and whether such value would be more or less than the sum of 10,559*l.* mentioned in the contract. The arbitrator found that the bills of quantities on which the contractors were invited were in material and substantial error, insufficient, and he also found that there was a usage in the building trade that where tenders were invited in accordance with plans and a bill of quantities furnished, the person tendering was not expected to furnish quantities himself, but had a right to assume that the quantities were correct. With these answers before him, Mr. Justice KENNEDY and Mr. Justice PHILLIMORE gave judgment for Messrs. FORD for 5,090*l.* The contractors appealed. The Master of the Rolls said it was for the builder to verify the quantities which had been prepared in order to enable him to understand the value of the work for which he was tendering. There was no usage in the present case that the quantities were correct, that they were insufficient was an innocent mistake. The Divisional Court it was assumed there was a hard case against the contractors, but it was open to them to prepare a new estimate. By relying on what was done by the contractors just as much backed the architect's bill as the owners. As there were additions Messrs. FORD said to be entitled to receive 2,303*l.* 10*s.*

On noticing the proceedings before the Examiner on the Standing Orders respecting the London to Brighton Electric Railway, we concluded by saying, "Enough allegations have been sustained to make it doubtful whether the Bill will ever reach the stage of the first reading." We do not know the gift of prophecy; what we said represented the opinion of engineers who have had experience of the Bill in parliamentary procedure. The Examiner's report was conveyed to a committee of the House of Lords on the 11th inst. The agent for the promoters of the Bill said that the course taken by the opponents was one which for the first time had been deprecated by all public bodies, who, by relying on defeating a Bill on technicalities, had failed to have it dealt with on its merits. In our opinion we anticipated that statement, but we added that the Bill of opposing Bills on points of another class was not in favour of accuracy in the operations of the Bill. It must be admitted that the waste of money in preliminary work is a serious item. But if

blunders on surveys, sections and reference books are once tolerated there is no foreseeing to what consequence they may lead. The Standing Orders are not severe, and, in fact, every facility is given to promote economy by the use of Ordnance maps. At the same time, errors in Parliamentary plans much more trivial than those committed by the surveyors of the electric railway have led to expensive litigation. Parliament has a right to insist on its authority being respected, and unless plans and sections are as correct as is prescribed, there is no use in preparing or lodging them. The failure will be a lesson which was demanded in the public interest, and the only regret is that the promoters of the line will be compelled to pay for the neglect of those to whom important work was entrusted. Whether the attempt will be renewed in November is doubtful, for the London, Brighton and South Coast Railway profess to be prepared to adopt electricity as a motive power, and to bring in a Bill in the next session to obtain the requisite powers.

A CLERGYMAN has an advantage over laymen, for whenever he suffers from a local grievance he is able to invoke the sympathy of his congregation. A great many men have to pay smartly when new roads are made adjoining their property; but although they grumble, they are not likely to meet with people who will care to share the burden with them. The Rev. W. N. P. BEEBE, who is vicar of one of the Brighton parishes, has made the following statement:—"I have had a somewhat unpleasant surprise lately. The Corporation have made a charge upon me for 44*l.* 12*s.* 4*d.* in respect of road-making and paving. The facts of the case are these:—In 1885 the boundary walls of the church and vicarage were built, the land to the north-east of the church and vicarage being the well-known Queen's Park Cricket Ground. In 1894 the cricket ground was cut up into building plots, and a new road, St. Luke's Road, running north and south, was made, adjoining the blank east boundary wall of the vicarage. To this road I have never had any access, as my sole entrance is from the old road known as Queen's Park Terrace. The Corporation decided that my eastern boundary wall, some 80 feet long, constituted a side frontage to the new road. I appealed through my solicitors, but without success. It certainly seems a hard case that I should be subjected to the noise and annoyance of a side street, and should have to pay heavily for the making of a road which is of no use to me and which constitutes a very great nuisance." It may be hard for the clergy to be amerced by local bodies like ordinary ratepayers, but it would not be difficult for Mr. BEEBE to discover that all over the country similar annoyances occur, and they have to be borne silently.

WE lately commented on a case which turned on the right to obstruct the access of light and air to a glazed roof which had long been darkened in order to serve as a photographic dark-room. Another case somewhat analogous in character has been heard in the Chancery Division before Mr. Justice JOYCE. It was an application by the owner and occupier of an hotel in Portsmouth to compel the owner and occupier of adjacent premises to take down as much of a new building as obstructed or interfered with the access of light to the hotel. The defence was a denial that the plaintiff's lights were ancient or that the alleged obstruction caused any damage or annoyance to the plaintiff or seriously interfered with the use of the plaintiff's premises. Mr. Justice JOYCE on Monday dismissed the action with costs. His Lordship said the window which plaintiff alleged to be darkened by the act of the defendant was part of the roof of a conservatory of the hotel. In June 1873 the then owner of the hotel entered into an agreement with defendant's predecessor in title to pay one shilling a year for allowing the window to open on and overlook defendant's property. The right of light over defendant's property which was enjoyed was thus made by agreement, and the plaintiff had therefore not enjoyed the access of light for the full statutory period of twenty years. In the former case the plaintiffs succeeded, but there was no shilling a year agreement, and when an easement over a low building is desired a similar arrangement would be advantageous.

### ROMAN BUSTS.

AN article on "Busts and their Identification" appeared in the first number of this Journal for the present year. The subjects selected were HOMER, DEMOSTHENES, EURIPIDES, LYCURGUS, ALEXANDER and PITTACUS. We endeavoured to explain to what extent they could be regarded as likenesses, although in no case could their veracity be accepted without misgiving.

We give this week six examples of Roman busts which are worth a comparison with the illustrations already published. At the first glance it will be evident that the Roman or Greek-Roman works, although less noble, present more individuality. This, no doubt, is partly owing to the practice which was avoided by the Greeks, but which was common with Roman sculptors, of marking the pupil of the eye in such a way as to suggest animation. Modern sculptors sometimes follow Greek precedents and sometimes Roman. It is, however, generally understood that for heads that are possessed of dignity it is wiser to follow the Greek manner. But apart from the treatment of the eyes, there is an absence of convention which helps to prove that the Roman busts were imitated from nature. There is also confirmation from coins and medals that the features have personal peculiarities. In the two busts which may appear to have a little correspondence, viz. those of LUCIUS VERUS and MARCUS AURELIUS, it will be observed on examination that the features differ, and any resemblance which exists is mainly caused by the arrangement of the hair.

AUGUSTUS was so supreme as a ruler, it would be strange if he were not selected as a model by contemporary sculptors. There must have been many demands throughout the Roman empire for his likeness. A bust now in the Vatican, which was found by the English Consul FAGAN during the excavations at Ostia in the beginning of the nineteenth century, gives us the appearance of the nephew of JULIUS CÆSAR in his youth, when he was recognised as the inevitable heir to universal dominion. OCTAVIUS was allowed to share in some of the labours of his uncle, and in the events which followed the mighty Roman's assassination he played his part with a craft which was remarkable. The "scarce-bearded CÆSAR" not only held his own position with triumvirs like MARC ANTONY and LEPIDUS, but eventually he established himself as the successor of the Dictator. Then, from the bust we have reproduced and others resembling it, we can see how supreme authority exercised for many years wrought its influence on the countenance. As a stroke of policy it is at the same time suggested by means of the crown of oak leaves that AUGUSTUS had not lost his respect for civic honours. There also exist busts of the Emperor in his old age, and the three combined are like the work of a biographer. They

reveal the life history of a ruler in one of the most troublous periods which the world has passed through.

He was a man who evidently believed in progress at a time when so many Romans were eager to make the attempt of restoring the severest republican simplicity. AUGUSTUS sought after intellectual refinement. Artists' literature obtained favour of a kind which under the public was unknown. He boasted that he found Rome of brick and left it of marble, and the utmost that can be said of any later period in which literature has flourished is to describe it as an Augustan age. HORACE and VIRGIL have celebrated the Emperor, and it was the intention of the latter to have made AUGUSTUS the theme of a poem. But the imperial patronage was not without effects on both of them, for there are passages in their writings which suggest a desire to imitate the manners of courtiers. The house of AUGUSTUS was remarkable for its unobtrusiveness, but in it he maintained the dignity of office, and SHAKESPEARE was not yielding to fancy when he made AUGUSTUS condemn the soldier-like conviviality of ANTONY in Egypt:—

To give a kingdom for a mirth; to sit  
And keep the turn of tippling with a slave;  
To reel the streets at noon, and stand the buffet  
With knaves that smell of sweat.

He would also object to the return of his sister OCTAVIA "as a market maid" to Rome, instead of being met at every stage by troops and all the gratification which could be expressed by ostentatious display of power.

Over a century elapsed between the reign of AUGUSTUS and that of HADRIAN. By that time imperialism was solidated. HADRIAN was a typical emperor; every soldier knew of his courage, and a great many Romans could testify to his generosity. He was not satisfied with battles which he was successful. In his eyes the builders' work was as useful as the sword and spear. Everywhere he utilitarian works constructed. Among his Roman structures was the Temple of Venus and Rome, in which the genius of the city was put on a level with the mother of the gods, JENES. It is in connection with that building that is told of the fate of APOLLODORUS, the architect. His plans, it is recorded, which were prepared under the Emperor's direction in Rome, were sent to the Greek cities for approval. He considered that the building would be small if compared with the statues of VENUS and ROMAN. The two seated figures could not stand up or find a door high enough to allow of their exit. The critic was banished for so frank an opinion, and afterwards, some suppose, murdered. But a single life counted for little in imperial Rome. Among all the Roman emperors there was not

owed as much enthusiasm for building as HADRIAN. e seen from the bust that he was a vigorous man, uld be fond of having his own way in all things, but uld be generous. The bust confirms the statement was the first of the emperors who allowed his beard in order to conceal some natural defect or a wound in early days.

us the intention of HADRIAN that LÆLIUS VERUS uceeded him. LÆLIUS died two years afterwards, his choice fell upon TITUS AURANIUS ANTONINUS, ondition that he should adopt LUCIUS VERUS, the LÆLIUS. ANTONINUS is known not only in the of Rome, but in the history of philosophy as AURELIUS. He was a Stoic, and his "ations" will never be allowed to die. Throughout he found opportunities every day to put his ay into practice. The name of his wife FAUSTINA ned an unenviable notoriety. LUCIUS VERUS, who associate in sovereignty, devoted himself to rather than to government. He was a fop, and an soldiers who were placed under his command n have had difficulty in restraining their temper at g of a man who was always defeated. He was his hair, and it is related that he used to have it rl with gold dust in order to give it more effect. ose his face was brought into keeping with his the aid of paint. The bust is not, however, e of debauchery or cruelty, and as long as MARCUS as was near him LUCIUS VERUS appears to have rifferently well. His belief in his own beauty was ver, an advantage for an emperor, unless he took public affairs, and it was fortunate for Rome that efore his co-partner in the Government.

xcuse on the plea of vanity can be made for ALA, who began to reign about fifty years after AURELIUS. There is no doubt that he possessed defects, and, like ALEXANDER POPE, the English was, on account of them, compared with ER THE GREAT, for "AMMON'S great son one had too high." His father, SEPTIMIUS SEVERUS, him on the throne, and when they were both in is related the son conspired against his father and ced to murder him. CARACALLA, or BASSIANUS, s uld be called, with his brother GETA, were in when their father died at York. The two brothers d to Rome, and it was not long before GETA'S ken at the instigation of BASSIANUS. Unquestion- as one of the worst of the Roman emperors. n the peculiar look which the sculptor imparted to is allowable to conclude that he was a mono- It must be recorded to his credit that he enriched a baths of a splendour which was unknown before and has not been since surpassed. The dome g at hall must have exceeded in size and height t: Pantheon. He reigned no more than six years,

and if he had lived he might have atoned for his early excesses.

His brother GETA had little opportunity to exercise power for good or evil. He is described as a handsome man, who loved to be tranquil and who was not disposed to shed blood for trivial offences. It is possible he would have served as a compensatory influence if he had outlived CARACALLA; but as he was murdered when he was little over twenty, it would be unavailing to speculate about his future conduct.

ALEXANDER SEVERUS, if we may judge from his bust, was ill-adapted by nature to control an army that had become tumultuous, or to cope with Eastern monarchs commanding nations of troops who had resolved on the downfall of the Roman Empire. We can well understand that so characterless a personage was not fitted to go through the rigours of the campaign against the Germans in their wild forests, and that he preferred buying peace to fighting for it. He was destined to be killed in a mutiny. Like CARACALLA, he expended money on the adornment of Rome, and he erected costly thermæ. It is evident from the bust that in the third century portrait sculpture had reached an advanced stage in Rome. The desire to increase the expression of the eyes does not, according to modern ideas, increase the value of the work, but with that exception the execution is perfect, and the bust has a right to be esteemed as one of the treasures of the Louvre.

Roman busts, and more especially if they bore the names of emperors, were long prized in England. Apart from any merits they might possess as works of art, they were considered to be appropriate as indicating the taste of the owners. In many cases they were memorials of the Grand Tour, in days when a journey to Rome was a costly event which was thought to work a revolution in a gentleman and to give body and consistency to the education he had received in one of the universities. Besides, it may be said that the influence of Rome was never entirely absent from this country. The Roman missionaries can be regarded as the successors of the Roman soldiers. The Saxon invaders no doubt gained far more power in England than was ever acquired by the Roman legionaries, but the mythology, legends and poetry of the north were quickly forgotten. The books which were read in monasteries took no heed of the legendary lore which in one form or another was to be found not only in Germany, but in Denmark, Norway and Iceland. What has long been known as culture was based on the literature of Rome, and it was only in modern times that people became aware of the existence of an Anglo-Saxon literature and of northern compositions, which had as much claim to be classed as epics as any Greek or Roman production. It was a tribute to Roman power when busts were seen on pedestals in galleries within English mansions or in circular recesses on the exterior of them.

## APPLIED PERSPECTIVE.\*

IT was thought to denote judgment on the part of JAMES MILL when, in treating of sensation in his "Analysis," he advanced from the simple to the complex by placing smell and hearing before sight. We cannot consider sight as we do the other senses. For, as MILL said, "so many things appear to be seen, which are only suggested by the feelings of sight, it requires the knowledge of other elements of the mental phenomena to explain." If what we suppose we see is partly owing to a process of reasoning, then vision is more than the impression on the optical apparatus. The saying so often repeated about the eye seeing what it brings the mental power to see is a testimony to the fact that something else is needed in perceiving an object than the mere opening of the eyes.

From time to time circumstances arise which, if at first a surprise to us, demonstrate the difference between things as they are and as they are supposed to appear to the sight. A marked instance was exhibited in the photographs which Mr. MAYBRIDGE, the American, produced showing animals in motion. They were at once ridiculed by painters and sculptors for inaccuracy, but later experience, aided by moving photographs, has made people less positive about the truth of the representation of motion of all kinds. Fixed subjects also present surprises. A great many photographs, especially of a cheap kind, are to be seen, in which, from the disregard of aerial perspective, backgrounds are as clear as foregrounds, and except that there is a diminution in the size of the parts of the plate in proportion to their distance from the lens, the representations are on a par with those of the old "willow pattern plate." The Chinese artist who designed that well-known work with all his scenic ability probably was ignorant of rules of perspective, and if so, he did not differ much from a great part of the human race at all times. Ask an ordinary man who knows nothing about the science to give a suggestion of a street, and it will be found that he does not recognise at first the principle of lines sloping either downwards or upwards to meet a remote if not invisible point. It is also difficult to make a blind person realise that while vertical lines remain true, horizontal lines have a tendency to converge in a point as if to form angles.

The history of art shows that when men once understood what is to be gained by vanishing lines, they were disposed to make an excessive display of their new knowledge. Some of the exercises which were found on the walls of Pompeii suggest an almost childish vanity. The noble work of MANTEGNA at a later time also suffers from the same weakness, for he became more anxious about science than beauty. It is related of BRUNELLESCHI that he invented or rediscovered rules of perspective, a statement which applies to a great many Renaissance artists. In a drawing of the Baptistery at Florence, as we are told by his contemporary, MANETTI, in order that the spectator should not mistake the point of vision, he made a hole through the thick panel, one end being wider than the other. The spectator had to hold a mirror at arm's length facing the picture, and in that way he saw a reflection of the building. "You seem to see it in very truth," says MANETTI, "and I have had it in my own hand, and I have seen it several times in my days, so I can bear witness to it." But in a picture which he made of the Palazzo Vecchio there was neither sight-hole nor reflector. "One might ask," says MANETTI, "why he did not make for this picture, which was equally drawn in perspective, that little sight-hole, as he did to that of the Baptistery. This is by reason of the picture being so large—there being so many things to represent in it—that it would be impossible for a person to hold the picture with one hand. Nor would the arm of a man be long enough to get the mirror at the right distance to reflect it, nor strong enough to hold it steady." There was a little of charlatanism about the arrangements, but as there was success we cannot blame the showman.

BRUNELLESCHI having to present his view to Florentines, all of whom knew more or less about art, it was allowable for him to make elaborate preparations for puzzling them. But with the generality of people in modern times, it does not take much knowledge of

perspective to produce effects which are thought wonderful. Very little science is needed, to take a simple case, to make painted letters appear as raised solids. They are, however, looked upon as such evidence of skill that in their announcements sign-painters largely employ them. The devices of the kind were at one time more prized than an outline drawing. But owing to the commonness of photographs the old mystery attached to perspective is vanishing. They manifest that horizontal lines when seen in perspective become different from front or back views, and expected that anyone who will represent things will be able to make arrangements which will produce the same effect. For writers on perspective, photographs have become valuable aids, and they have done much to overcome the notion that perspective was a branch of geometry, and that a limited number of propositions in it were tenable. The assistance of a small camera a student can discover. A comparatively simple object can be made to present a variety of appearances, all of which will be alike true.

In Mr. LONGFELLOW's new book on perspective, employment has been made of photographic illustrations than is usual. But they do not interfere with the introduction of very numerous diagrams, which have been prepared the ordinary way. The work is intended mainly for students of architecture, but as painters have also to depict buildings and other classes of construction, what is said will be suggestive to them also. At the beginning the author tells a story which to English people will suggest that SAMUEL JOHNSON, the Clockmaker must, owing to the progress of education in America, have turned his attention to scientific applications. The moral drawn from the circumstance will enable anyone who have not Mr. LONGFELLOW's book before them to understand his proposition:—

Years ago a wanderer appeared at Harvard College, tried to introduce an apparatus and a process by which anybody could sketch without learning. The apparatus consisted of a sheet of glass slipped into an upright frame, and a fixed eyepiece, which was simply a wooden standard with a hole at the top. The process was to set up the apparatus before the view to be traced, the picture by a pen and ink, with which he could draw lines on the glass, keeping the eye at the eyepiece to maintain the point of view. The contrivance helped one to draw, but it was a good illustration of the undervalued process of perspective or of sketching, which is drawing in perspective. For a true sketch or perspective drawing is a copy on paper of such a tracing or projection as is made on the glass. The fixed eyepiece marks the station point of the observer, which must not be changed, for the view will change with the position of the glass plate represents the surface on which the picture is thrown, which must also be immovable, or the representation will alter both in shape and position on the paper. The scene or object that is drawn is projected—that is, cast upon a flat surface as if by such a process as this. When we see something which is before us we practically look upon it as seen through a window, and transfer to the paper on our table or to the sketchbook on our knee the projection of the scene upon the glass of the window. This process of projection is in most cases unconsidered, but it is really behind what we are doing, and to recognise it adds clearness to our sight as to our understanding. In studying perspective we should consider that we draw things as they are seen again on an imaginary plane set up in front of them, and that our eye only repeats what is thrown as by a camera upon this plane.

Mr. LONGFELLOW from this introduction proceeds by step in his instructions. He keeps steadily in view that the reader or student is not in search of mathematical problems, but of power which can be utilised, and that the diagrams and explanations are only preparatory to exercises in drawing. The student in this way can measure his rate of progress. In perspective problems applications are indispensable, otherwise the student is apt to forget his diagrams. TURNER, we suppose, was not when he taught perspective in the Royal Academy, but he attempted an outline of his *Ulysses and Polyphemus* which would have seen that his gorgeous Greek vessel could have passed through the opening which is shown in the picture. In many cases Mr. LONGFELLOW's conclusions are tested by the photographs. One case is the clock of the Broletto in Como, and all who look at it will say incorrectly that the perspective ellipse of a vertical circle is only a straight line when the centre of the vertical circle is on the horizontal line and that of the horizontal directly over or under

\* *Applied Perspective for Architects and Painters.* By William P. P. Longfellow. (Boston and New York: Houghton, Mifflin & Co. London: Gay & Bird.)

the centre. In other positions the axis is inclined towards the centre. The clock seems to be distorted not in outline but on its plane. We are informed that it is an example out of many to prove to us that nature is full of things which do not look well in pictures.

The second part of the volume deals with subjects that are puzzling to young draughtsmen, such as oblique planes, circles in oblique planes, points and tangents, centers and axes, shadows, tri-conjugate vanishing points, polygonal pavements, octagonal pavements, broach spires, gables, pediments, entablatures, arcades, vaulting, &c. The volume is essentially one for drawing-offices and studios. It suggests the class of problems with which the author has most often to deal with, or which gave rise to delay in drawing. It will therefore have utility in a number of cases where the ordinary treatises on perspective could not be made to serve.

## EARLY RENAISSANCE BUILDINGS IN ENGLAND.

Thursday evening, March 20, a lecture, in connection with the Carpenters' Company, illustrated by lantern slides, was delivered on the above subject by Mr. J. Alfred Spence, who was introduced to the large audience by the chair-Lord Avebury.

Architecture, said the lecturer, in common with other things, runs under the observation of mankind, shows a tendency to change. No sooner have forms become established and carried towards perfection, than they are supplanted by others, which in their turn linger just long enough to give their character upon the period, and then give way to others. Just as in Ariel's song, every part of the drowned world change "into something rich and strange," so in the history of architectural ornament, no sooner is one form established than it melts into something else equally rich but less strange. In England this process of evolution went on uninterrupted for four or five centuries, from the time when we may be first said to have possessed a national architecture down to the end of the fifteenth century. The various phases of this process have been named Norman, English, Decorated and Perpendicular, and each such phase was suggested by something that went before. A new growth sprang from another that was already established. But at the beginning of the sixteenth century, in the reign of Henry VIII.'s time, the conditions underwent an alteration; came an outside influence to affect our English development, and certain forms and features crept in which had their origin not in the severe grey atmosphere of England, but in the sunny air of Italy. In other words, English architecture felt the touch of the Renaissance.

As the earliest effects of this new influence to which we had desired to draw attention, and to the manner in which those foreign forms were at first received. In course of time they established themselves firmly, and, invaders as they were, they ousted the natives of the land from their ancient positions. But in the beginning their foothold was somewhat precarious. They effected a lodgment here and there, not all over the country, in this feature and in that, not over the whole structure. But fashion was in their favour, and gradually, with increasing celerity, they spread hither and thither to displace the whole of the ancient forms. The struggle went on throughout the whole of the sixteenth century and well into the seventeenth. At length, under the leadership of Inigo Jones, the invaders finally triumphed.

In reply to the question, What is the Renaissance in architecture? the following are a few of the facts. In Europe there have been two main styles of architecture—the Classic and the Gothic. Greece and Italy are the homes of the one, the countries of Western Europe are the homes of the other. The many and gradual changes from one to the other are of great interest, but the chief importance is that by the end of the fifteenth century all conscious connection had long ceased, and the men of the Gothic buildings had no notion that there was any connection with their own of dealing with a building and ornamenting it with ornament.

In the history of the Renaissance in Italy it was considered superfluous to go, but so far as architecture is concerned, it should be borne in mind that many of its masterpieces were well advanced in years before English work could show the slightest trace of Italian influence. The influence of the Renaissance had dominated Italian work long before it came to us from France to our shores. It was our countryman, Christopher Columbus, who bridged the Channel for its passage, and who brought Italian artists to come over to this country—among them Bramante, first in rank, the object of whose visit was to design a splendid tomb for Henry VII. He was

followed by a few more Italians of great skill, although much of Italian-looking work was executed by English workmen.

Mr. Gotch proceeded next to illustrate his theme by a number of examples:—1. Examples of Gothic; 2, examples of Italian Renaissance; 3, examples showing the manner in which the forms of the Renaissance obtained their footing in English architecture. Almost the whole of the examples, except the Italian, were taken from work executed between 1500 and 1545. Some of the tombs, however, were earlier than 1500, and some later than 1545.

The illustrations thrown on the screen comprised, first of all, the roof of Henry VII.'s Chapel, the foundation-stone of which was laid in 1503; details of the end of side aisle and Islip's chantry, all Gothic. Next followed "Doorway at Genoa," "Choir Stalls, Certosa di Pavia," and drawings of some details executed by Italian workmen.

The succeeding views were of two tombs at St. Croce, Florence, executed in the fifteenth century; tomb at church in Arundel, Sussex, late fifteenth-century work with Italian characteristics; tomb at Lowick, dated 1520; Henry VII.'s tomb, executed by Torregiano between 1512-18, but the heraldry thereon is by English hands, showing that English craftsmen worked in collaboration with the Italian master. Then came the "Duchess of Richmond's tomb;" "Tomb in Stanford Church," dated 1588; "Sir George Vernon's tomb in Bakewell Church," dated 1567; the "Salisbury Chantry" at Christchurch, Hants, dated about 1529, with details thereof; "Draper's Chantry" in Christchurch, dated 1529, and "Sir John of Basing's tomb" at Basing Church, dated about 1570.

The wooden panelling of a house called "The Wyne" in Hampshire, executed previous to 1530, was next illustrated and described. The beautiful panelling at Magdalen College, Oxford, dated 1541, was also introduced, and the accounts for this which are still in existence show that the wainscot was bought in London and brought by a man named Fisher to Henley, and from thence to the College by Richard Weston. Paulyn sawed it up, John Carver provided the glue; Aldrich, White and Hobbs were the masons who prepared the hall; John Hanson provided fifty-two rods of panelling for the hall; Henry Bolton and Frost were the two principal joiners employed and they did the carving. Of these men Hanson took 8*d.* per day, Bolton 8*d.*, Frost 7*d.*, while the ordinary labourers were paid 6*d.* The total cost of the panelling was 29*l.* 12*s.* 5*d.* All this tends to show that the work was done by ordinary English workmen.

The succeeding views were of "Deene Hall, Hants," showing how Italian influence had spread; the "Panelling from Dining-room at Haddon Hall," dated 1545, revealing certain Italian features, although the general treatment is Gothic; the "Panels from Foxton Church in Northants," a very excellent example of Anglo-Italian work. Then came the finest example of Italian in England, viz. the "Screen of King's College, Cambridge," dating between 1532-36.

The lecturer next turned to some of the "great houses," and first of all gave an illustration of the house, or rather palace, which Cardinal Wolsey built in order to be near London without being in London, viz. Hampton Court. Commencing with the entrance, which is Gothic in design, and dating between 1514-15, there was shown to be a slight touch of Italian work in the arms over the gateway, while the roundells, ten in number, are the work of Giovanni da Maiano. The beautiful ceilings inside were also evidently of Italian design. When Wolsey died in 1530 Henry VIII. took possession of Hampton Court and enlarged it. He built anew the great hall, of which the roof is one of the finest pieces of timberwork in England. A view of this was shown, the conception in general being Gothic, but some of the ornamental and carved work is Italian in character. All the work was done by Englishmen. John Wright, freemason, carved the corbels; Richard Rydge carved all the wood pendants, and Michael Joyner did some small part of the ornamental woodwork. The hall door was Gothic, although the spandrel was of Italian design, and alongside the Gothic chapel doorway there was an Italian panel commemorative of Jane Seymour, dated 1536-37.

After alluding to Nonsuch Palace and Cowdray Court, the lecturer went on to say that while Hampton Court was being built by the great Lord Cardinal, other favoured servants of the king were building smaller but still remarkable houses, such, for instance, as Marney House in Essex, built by Sir Henry Marney, 1520-25; Sutton Place, near Guildford, built 1523-25, by Sir Richard Weston; and Laycock Abbey, which belonged to Sir Wm. Sharington, who was lord of the manor in 1540.

These examples served to show how fitful the new fashion was in its appearance, for if a blank map of England was taken, and only those places were marked on it which can show matured specimens of the style, it would be only the southern and eastern portions which would have any writing on them. The whole space north of Oxford and west of Cambridge would be practically clean. The other point which they tend to bring out is that, in spite of the Italian character of the detail, much

of the work was executed by English craftsmen who must have caught the foreign trick from Italians, Frenchmen or others who came to our shores partly by express invitation and partly in order to escape the tyranny of circumstances in their own native lands.

Lord Avebury proposed a very hearty and cordial vote of thanks to Mr. Gotch for his interesting lecture. This was seconded by the Worshipful Master of the Carpenters' Company, and carried unanimously.

## THE SEPULCHRAL MONUMENTS OF THE GREEKS.

ON the 20th inst. Mr. John F. White, LL.D., Dundee, delivered a lecture in the Art Gallery, School Hill, Aberdeen, says the *Aberdeen Journal*, to a large and most appreciative audience on "The Sepulchral Monuments of the Greeks."

Dr. White prefaced his lecture by a few preliminary remarks. Science in its application to industry, he said, was of the very first necessity for this nation in order to keep abreast of the other nations who were trying to outrival and outstrip us, but he thought they would be wrong if they did not include the other side of education—the spiritual and humanistic—because no nation had reached the highest civilisation simply by science. It was rather by a widespread, large acquaintance with everything that formed the individual. Culture was to the individual what civilisation was to the community. In choosing as the subject of his lecture "The Sepulchral Monuments of the Greeks," one might be at once confronted by the question, What had the manners, customs and monuments of the Greeks to do with them and their Christian religion? The answer, he thought, was very easy. For hundreds of years sculptors and workers in monuments had adopted many of the forms of the Grecians. Mentioning many of the world's most famous monuments and sculptured memorials, the lecturer, who spoke in an easy, conversational style, and treated his subject in an unconventional and very interesting manner, went on to say that the whole history of art led them to believe that the experience and knowledge which could be gained by a study of the methods and high perfection of the ancients should surely be useful to those who were working in the same line of monumental art, in order that fresh ideas might be arrived at, for free contact with that which had been well done before should be the very means of inspiring to higher work on the new lines on their own basis. He introduced the subject with great pleasure, hoping that he would be able to show what they could do to carry the education of the people—the education of the artisan, and the education of the artist—on these lines. Proceeding, Dr. White remarked that ceremonies in connection with the burying of the dead had occupied and would occupy the attention of every student of human nature, connected as it was with the most eventful period in a man's life, with the beliefs of the people with reference to the unseen world, and also the beliefs of the people in regard to a God or to gods. Therefore, it was not to be wondered at that students of comparative religion had taken a great interest in all those ceremonies connected with the burying of the dead; and they found, perhaps, that there was more instructive information to be got from comparatively uncivilised people. It was not with the religious aspects of this question that he was to deal, however, but rather with the monuments that had been raised to the memory of the dead. Of all the great nations of antiquity which had left great monuments to the dead Egypt and Greece stood out most conspicuously. Egypt, the elder by many thousand years, had left monuments of most colossal proportions unimpaired for our observation—monuments which struck us by their magnificent conception and by their grandeur. What, in this respect, could compare with the Pyramids and with the gigantic effigies of the kings of Egypt? After rapidly sketching the characteristics of ancient Egypt and its inhabitants, whom he described as having no individuality and no sense of citizenship, and who had no dignity in manhood, the lecturer went on to deal with the gods of Egypt—the deified forms of animals—and from them turned to the Greeks, whom he showed, by comparison, to be a free people, self-governed, proud of their citizenship, enterprising in every point, who imported ideas from all sides—from Egypt, Phœnicia, and other places—assimilating that which they imported and giving it their own form, and who rose to a higher form of worship, making their gods in the finest forms of manhood and womanhood. The progress in the sculpture of their gods was steady, and by the middle of the fifth century before Christ had attained absolute perfection at the time Phidias appeared. Dr. White then, with a fulness of knowledge that showed how deeply he had studied the subject, sketched rapidly the Greek ideas as to the world beyond, from a period 1,500 years before Christ, and showed a gradual rise in the conceptions as to the fate of mortals

when they left this life. In the earlier period the spirit worshipped, and oblations were made in order to gain some benefit or avert evil. In Homer's time the shade was supposed to carry on in a dreamy, shadowy sort of way the life of the earth. Once in Hades the shade troubled the world no more. At a later period there was a higher conception of state of existence beyond, and instead of life being a dream and shadow it was a life that was to be made better by a process of purification. A vivid and lifelike representation of leading ideas which animated the Greeks was shown in a series of beautiful slides, beginning with a fine slab, having a figure of a dead man seated and attended by his wife, a being slain for an offering, and a procession of figures with uplifted hands, in token of reverence, the idea present being the worship of ancestors. The same idea was illustrated in a number of other representations of slabs with figures, showing a high degree of artistic power. Even finer was a picture of slabs from the Parthenon representing Jupiter and other gods, which it was not a great stretch to associate with the name of Phidias as the sculptor. It was followed by another magnificent slab from the Parthenon representing knights on horseback. This was followed by a vivid picture of a street in Athens, discovered in 1861, showing numerous monuments of a striking character, called the Street of the Tombs. The street had been covered by a mound, but in clearing it the contractor, a man named Davidson, whom the lecturer hoped, was not a Scotchman, in order to make the street straight destroyed many of the finest monuments which had adorned it. A number of these remarkable monuments were exhibited on the screen. All of them were a very beautiful character, the figures being generally those of young men, the lecturer remarking that the young man was of Grecian type more so than women. The figures were more ideal in form, and not portraits, as portraiture did not come into the art of the Greeks until the time of Alexander the Great. Dr. White also directed the attention of his audience to the fine expressions of the sculptured figures, which, he said, depicted a strong characteristic of the Greeks, namely, the care which they guarded against any manifestation of feeling, also the care which they took to depict a Greek with calm cheerful countenance in the face of death. The lecturer then threw on the screen a picture of the finely carved head of a stele or tombstone. He was sure they would all be struck by the beauty and possibility of such work. It was, he said, quite possible from this and similar examples of Greek art to arrive new form to the ideas of the monumental sculptors of Aberdeen, making sculptured monumental work a new feature of the town, and to carry it on and make it world-wide.

## SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

THE ordinary monthly meeting of this Society was held in the lecture hall of the Literary and Philosophical Society, Leopold Street, on the 13th inst. Amongst those present were Messrs. T. Winder (in the chair), H. L. Paterson, C. Innocent, W. J. Hale, C. Gibson, T. Swaffield Brown, W. P. and W. C. Fenton (hon. secretary).

Several gentlemen were nominated for membership, Mr. H. C. Brameld was elected an associate; Messrs. W. Hale and W. Potts were elected auditors.

The City Council having agreed to the nomination of a member from this Society to sit upon the school of art committee, Mr. E. M. Gibbs was chosen as representative for the Society.

A vote of thanks was given to Mr. A. H. Holland for his kindness in letting the Society have the use of the Howarth Art Gallery for the recent exhibition of the R.I.B.A. drawings.

Mr. F. W. Troup, of London, then gave a lecture on "Leadwork." He said few people realised to what an extent lead was formerly used in the art of building. The ease with which the metal can be reduced from the ore made it so possible with the rudest of appliances. Once reduced to metallic state it is one of the most imperishable of the metals. It is, at the same time, the easiest of them all to melt, to cast, or to fashion into various shapes, either in the molten or solid state. This country has always been famous for its lead. A French writer of the seventeenth century says:—"The greater part of what we get here comes from England in the form of ingots, called 'Samnous,' weighing 400 lbs. or thereabouts. Germany also sends us some lead which is in squares. 'Samnous' of 120 lbs. weight, but the latter is short and less pure than that from England." Again, Harrison in his "Description of England," says:—"There were mines of lead somewhere in Wales, which endured so long till the people had consumed all their wood by the melting of the same." We find examples of lead having been used in Babylonia, Egypt, in Greece, and extensively in Roman times. There

examples of Roman coffins and cists and ingots in the museums. In the crypts of St. Paul's Cathedral he had Roman water-pipes lying stacked in heaps of old lead. This is not to be melted down when required for new sheathing for some or other parts of the roof. In Mediaeval times lead was used for covering the roofs of the finest buildings, also for lining and decorating spires of churches and cathedrals. London churches particularly were noted for their fine lead-covered spires, chiefest of them all that on Old St. Paul's. Yet with all this the work was often all done on the site of building. No elaborate machinery or complicated tools were needed. The plant consisted of a frame some 4 feet to 6 feet wide and 12 feet or more long, on which a sand bed was laid. Besides this little more was wanted, except a furnace in which to melt the lead. The molten metal was flooded on the levelled bed of sand, and from the sheet so cast every-thing could be wrought, bossed and beaten up, whether it were sheet for roofing or a crocket on a spire, or a lead-covered finial on a pinnacle. Various parts were cast in the same mould, and by imprinting moulds or patterns and running the lead into them, but the great mass of the work was done up from the flat sheet, and the great art of the plumber consisted in fixing, laying or hanging his lead in such a way as to cover and protect the roof or spire from wet, and yet keep it soft and ductile metal from slipping or dragging itself off. It was taken that the sheets should not tear or crack by contraction of the metal at night, after being beaten on by summer sun, there was no reason why the material should not last for ever, none at least except fire, from which no metal is safe that rests on a wooden substructure. Gradually the use of lead for anything but the most utilitarian purposes went out, and now "plumber" and "sanitary engineer" are convertible terms. The "leadwork" of a building comprises pipe casings or the grand display of sanitary waste-pipes and ventilators, culminating in the inevitable gully that tells of modern sanitation. There is, however, no reason why lead should not be restored to its ancient prestige, and be used once more as a pleasant and sightly material, and in which the workman can display his fancy and lavish his labour of love.

The motion of Mr. Paterson, seconded by Mr. W. J. Fenton and supported by Messrs. W. C. Fenton, T. Winder and others, a hearty vote of thanks was accorded to the lecturer.

#### CHRIST'S HOSPITAL SCHOOLS, HORSHAM.

In a few weeks Christ's Hospital Schools will be completed, and soon the Bluecoat Boys, says the *Sussex Daily News*, will occupy the magnificent buildings at West Horsham. Now the schools are practically finished their grandeur and beauty are strikingly manifest. Though there may be some feelings of sadness and regret at severing long-cherished associations with the ancient historic buildings at Newgate Street, they cannot fail to be impressed with their new quarters, and as they are with all the latest modern improvements, plenty of light and space and situated on an invigorating site commanding an extensive view of the beautiful Downs of Sussex and the picturesque Surrey hills. The quadrangle is approached by two drives; the western drive leads to Horsham, and the quadrangle is entered through a porch which bears the schools' coat of arms and the words, "Fear God, Honour the King." The eastern drive leads from West Horsham station, which is now nearly completed, and is proposed to be opened on May 1. The porch at this entrance bears the inscription:—"This cloister and east range and ranges, rebuilt by public munificence, were completed in the year of our Lord, MDCCCXXXVI., William Thompson, Esq., M.P., Chairman; Richard Hotham Pigeon, Esq., Treasurer; John Shaw, architect." There are also the words, "God. Honour the King."

The cloisters, built of brick and stone groin, on the eastern and western sides of the quadrangle are finished, and comprise a wide promenade 323 feet in length. The extensive quadrangle is being prepared for the laying of the turf. In the centre will be erected a fountain, which will be surmounted by a statue. With this latter exception, all the statues have been placed in their specified positions, a task which required a considerable amount of care and skill. This was very successfully accomplished, not the least damage being done to a single stone. The headmaster's house and the various boarding-houses are being scrubbed out, a numerous staff of women from the West Indies being engaged. When this process is completed the boarding-houses will be ready for occupation. The headmaster is expected in residence on April 10. Around the quadrangle the art school, library, school hall, infirmary, sanatorium, kitchen and the commissariat buildings, with their numerous offices, and quarters for the matron and their assistants, are all completed. The sanitary arrangements are the most perfect in existence. In a few weeks the science school, school hall and chapel will be

completed, as well as the gymnasium, swimming bath and laundry. A feature of the school hall is the beautiful, artistic roof of Oregon pine. There is also a fine roof of Oregon pine in the chapel.

The school's famous picture will be hung in the dining-hall soon after Easter, and it is expected that ten other paintings will also occupy positions in the grand hall. Some buildings which formerly belonged to the Aylesbury Dairy Company are being converted into a gymnasium and swimming-bath. The gymnasium will be fully equipped. The bath, which is in an adjacent building, is 88 feet by 25 feet, while the depth at one end is 7 feet and at the other end 3 feet. There is also a smaller bath, 34 feet by 25 feet, with a depth of 7 feet 6 inches and 3 feet. At one end is a gallery and around the bath are the dressing-boxes, over which will be erected another gallery. The building is admirably adapted for the purposes of a swimming-bath. The electric installation is completed and a thousand lights have already been switched on; when the schools are in use there will be 4,000 lights. The grounds are being laid out from artistic designs, and will include ornamental enclosures and flower beds, and present a very picturesque appearance with the circuitous walks. There are extensive playing grounds, and that portion allotted for cricket is being rapidly prepared. The whole of the work is being carried out under the direction of Mr. H. W. Tingley, manager of the works, and Mr. Proudfoot, clerk of the works.

#### ADVERTISEMENT REGULATION IN PRUSSIA.

IN a letter to the *Times* Mr. Richardson Evans writes:—

A Bill which has been introduced by the Government in the Prussian Diet deserves the attention of English statesmen. The object of the measure is, in brief, to enable local authorities to prohibit the erection or maintenance in any prominent position of advertising boards and notices, with especial reference to the impairment of the beauty of rural scenery.

It has become a commonplace to contrast the practical instinct of the German people with the sluggishness of our British intelligence. But in this instance the only difference will, I hope, prove to be that the Ministers of King William II. have shown more promptitude in giving effect to the prevailing wish of their people than circumstances permit the advisers of our own Sovereign to display.

Up to the present the history of the question in the two countries has been very much the same. On the Rhine, as on the Thames, efforts have been made to use the powers given by law to municipal bodies for securing "safety" and "good order" in public places as an instrument for suppressing affronts to the eye. But the courts have held—as they were bound to do—that the intention of the provisions relied on was confined to the protection of life and limb and health. The duty, then, of the Legislature is manifestly to supply a missing element in municipal jurisprudence. Had the practice of "catching the eye" prevailed when the lines of municipal administration were first laid down, it would have been an obvious thing to arm the elected representative bodies with appropriate powers of control. This must be done speedily if even graver mischief is to be averted.

The Prussian Government bases its proposal on the fundamental principle that scenery is a national asset of inestimable value; that it is the duty of the State to intervene to save it from wanton destruction, and to "foster the love of natural beauty" in the people.

The appeal is not so much to sentiment as to common sense. Everyone who in Parliament or outside it approves of the expenditure of public money in laying-out parks and gardens, and in constructing sumptuous edifices and stately monuments, must be inconsistent with his reasonable self if he treats with indifference the wholesale havoc which the multiplication of advertising eyesores does to that absolutely costless source of delight—the aspect of our land.

Nor is it a question of hampering commerce and industry. Those who wish to compete for custom by advertising can find channels as convenient to themselves and less unjust to their fellows. In tourist tracks it is sheer stupidity to tolerate blots on the landscape. The owner of a field or a house may get a dose—greater or less—for surrendering it to a vile use. But the judicious traveller will carry his custom to inns in more fortunate regions when he finds that disfigurements kill the charm.

Let me express a hope that a patriotic House of Commons will soon invite a sympathetic Administration to save the honour and the true riches of our land, and show that in this department we can, indeed, "compete with Germany."

The Following Gentlemen were elected members at the last meeting of the Society of Architects:—Mr. G. E. S. Streetfield, of 26 York Place, W., and Mr. G. Ratcliffe, of Sheringham, Norfolk.

## NOTES AND COMMENTS.

THE builders of Sydney have some reason to be dissatisfied with their Government. The bricklayers went on strike because the hours of working were not reduced from 48 to 44 hours per week, and the wages increased from 10s. to 11s. per day. As the time selected was most inconvenient, the men's demands had to be accepted by the majority of employers. It is objected, and we think with reason, that the Government facilitate strikes by giving employment to men as labourers. An appeal was therefore made to Mr. PEACOCK, the Premier of Victoria, by the master builders, stating that they considered the strike was merely an endeavour to overthrow the established eight-hour system, and they asked that the Government would not make any alteration in the number of working hours. It was also stated that when a similar request was made to the railway department, which is a Governmental body, the builders were informed that the department would not interfere in the question of wages, its policy being to pay the rate that was conceded by private employers. That reply is considered as being an encouragement to the men, for it is equivalent to saying that if they can force the hands of private employers the Government will submit. The Government, by allowing the men to continue working, provides the funds to support the strikers while fighting the employers. As the Government are employing so large a percentage of the labour, it is felt to be necessary to deal with the matter rather than to quietly submit to demands which are forced from private employers under such unfair conditions. The Government, however, maintain that they are absolutely impartial, and the course that they have adopted cannot be departed from.

WHILE English explorers have been endeavouring with most inadequate funds to discover remains of classic times in Crete, the Venetians have not been forgetful that the Republic formerly possessed the island for nearly five centuries. The Royal Institute of Science and Art have sent a party of inquirers, under the direction of Dr. GERSTA, in order to ascertain how far evidence had survived of Venetian dominion. In the southern provinces they have met with ruined walls, cloisters and churches which were erected by their countrymen. The arms of many Venetian families and repeated examples in relief of the Lion of St. Mark were discovered, as well as frescoes which record the magnificence of the Venetian authorities in Crete and their families. The paintings recall the style of PAUL VERONESE, and will be especially valuable for the portraits and details of costume. A great many casts of various Venetian works in sculpture have been already sent to Venice, and the finds will have the effect of inducing scholars to investigate the subject of Venetian sovereignty in Crete more fully.

A FOREIGNER who makes a serious study of English ways must be puzzled when he reads the correspondence between the Education Department and the London School Board on the size of schools, and compares it with the speech of the First Lord of the Treasury a few days afterwards announcing that School Boards were to be abolished and the subject of building was to be dealt with in a manner entirely different from that which formerly prevailed. The foreigner would take it as the latest instance of the war between official departments which never ceases in this country. Vast sums of public money are wasted in consequence, but there is the satisfaction of knowing that somebody has profited by the expenditure. The School Board of London, though doomed to dissolution, have been informed that the Education Department consider that a school should not, as a rule, contain more than 1,000 children arranged in three departments of 300 boys, 300 girls and 400 infants, or 300 senior mixed, 300 junior mixed and 400 infants; and that only in exceptional circumstances could a school with three departments and a total of 1,200 be sanctioned, though, with an additional junior mixed department, a larger total might sometimes be accepted. Plans in the future must show that the recommendations have been followed, and the purchase of sites allowing of more accommodation will not have any influence over the department's decisions. The School Board of London in reply say the subject requires serious consideration. But

they "desire to express the most earnest hope that, with prejudice to the general consideration of the question of future provision on new sites, the School Board may rely on the Board of Education not making this new proposal of theirs retrospective so as to affect sites bought already by the London School Board with an area suitable for the large schools they have hitherto been in the habit of erecting, with the concurrence and in many cases at the suggestion of the Board of Education, nor in the case of the numerous schools planned by the London School Board for enlargement, and with the plans approved by the Board of Education showing plainly this intention and the necessary adaptation of plans of the portion of the school erected in the instance to those intended enlargements." The ratepayers of the Metropolis may well ask why the Education Department did not arrive at their conclusions several years ago. The Act has been in operation for thirty years, and when it is about to be superseded it seems not only absurd but prodigal, to revolutionise the arrangements, and to allow sites to fall into the dearthiness of vacant land in London.

It is gratifying to learn that Mr. ARTHUR EVANS has begun his third season's excavations in the Palace of Knossos with encouraging results. In a report to the Cretan Exploration Fund, dated the 13th inst., he says "Progress has been slow but satisfactory. South of the hall of the double-axes important rooms are opening. One of these, apparently containing another 'bath' with a parapet, shows a high dado of fine gypsum slabs with a fresco frieze—spiral pattern—still partly in position above it. In the adjoining room also a good deal of fresco has been found, quite an aquarium of fish, and the upper part of a good female figure. A very interesting magazine has come to light—closed since the earliest palaeolithic period—containing vases of the Kamares class, some with beautiful lily designs in white. A very remarkable find is a kind of domestic shrine at the end of a room with a small painted female image in position, with a dove on her head and a male votary holding out a dove. Deposits of inscribed tablets are also continuing to appear; one refers to the armoury, and the tablets show pictures of swords." The great obstacle to progress is a financial one. A sum of about 1,100*l.* has been obtained in response to the late appeal, but the revealing of the palace it is estimated will require at least 2,000*l.* It would not be creditable to lovers of archaeology and of ancient Greece to allow operations to come to a premature end and for the representatives of another country to resume them and, through some remarkable discovery, obtain renown for the whole enterprise. Subscriptions can be sent to Mr. GEORGE MACMILLAN, at Martin's Street, London, W.C., or direct to the account of the Cretan Exploration Fund, at Messrs. ROBERTS, LLOYD, BOCK & Co.'s, Lombard Street, E.C.

## ILLUSTRATIONS.

MERSEY DOCKS AND HARBOUR BOARD, HEAD OFFICES, LIVERPOOL.

CATHEDRAL SERIES.—RIPON: THE ROOD-SCREEN BETWEEN NAVE AND CHOIR.

THE old fabric-roll of Ripon Cathedral is evidence that a rood-screen existed in 1408. But whether it forms part of the present structure is uncertain. The style now visible is of a later time, and it was the opinion of Sir GILBERT SCOTT that the screen was executed about 1450. It forms a very massive wall, although adorned with niches and sculpture. In 1450 the central tower collapsed, and in consequence part of the south transept and choir had to be rebuilt. The old screen must have suffered as a consequence of the accident. The massiveness of the screen may be due to a desire for protection. It must have offered a more remarkable appearance when the niches were occupied by statues. Over the doorway within the rood is a representation of the Trinity. The shields were once emblazoned with the arms of benefactors, and the whole work in the fifteenth century no doubt presented a gorgeous sight to all who entered the building.

# THE ARCHITECTURAL ASSOCIATION.

MEETING of the Association was held on Friday evening last, Mr. W. H. Seth-Smith, president, in the chair. Messrs. A. W. Heath, R. D. Wells, and C. H. Wheeler acted members.

Following donations to the New Premises Fund were received:—Mr. C. E. Bateman, 5*l.* 5*s.*; Mr. Noel F. Barlow, 4*s.*; Mr. W. J. N. Millard, 2*l.* 2*s.*; Mr. D. T. Fyfe, 4*s.* Total subscriptions to date, 3,936*l.* 7*s.* 6*d.* W. H. LEVER read a paper on

## Villages Erected at Port Sunlight and Thornton Hough.

When your Association did me the honour to invite me to read a paper on "The Villages of Port Sunlight and Thornton Hough," it appeared to me to be necessary before accepting the invitation that it should be clearly understood to be outside of my ability to treat the subject from the standpoint of the architect.

I was good enough to repeat your invitation after giving this explanation, and now, if you give me your kind notice, I will endeavour, in as few words as possible, to give an account of the building, planning and laying out of the villages, and of the partial rebuilding of the village of Thornton Hough.

When Port Sunlight first, its history is soon told. Our works were started in Warrington in January 1886, and in the autumn of the same year the site being found to be too small for our rapidly growing business, it was decided that the best course would be to move entirely to some rural district where ample acreage was secured adjacent to both rail and water transport, with ample facilities for obtaining the necessary supply of water.

To provide this a decision had first to be made as to what part of England was best suited to the particular nature of the business it was intended to carry on. Rightly or wrongly, Mersey was selected as the best for our business.

In making maps of the district, I next proceeded to examine, by walking, partly by taking train, the most likely sites, and finally settled on land on the Bromborough Pool, about five miles from the centre of Birkenhead, and seven miles across the river from Liverpool Town Hall. The intention was to build works and village. The village was the scheme from its very inception. Our first purchases were 56 acres of land, of which 24 were intended for the works and 32 for the village. From time to time more was added to by purchase as opportunity offered, until the area is 230 acres, of which about 90 acres are devoted to the business and 140 to the village.

90 acres devoted to the business are of no interest to the architect, and therefore we will dismiss them and the buildings thereon from our thoughts and confine our attention to the 140 acres devoted to the village.

The ravines or gutters up which, to a greater or less extent, the tide used to flow, we have filled up, and the land at the bottom of the ravines, but only so as to bring it above high-water mark. This leaves the ravines available for use as parks and recreation-grounds, and so treated will become the feature of the village. At the junction of Bromborough Pool a dam is in course of construction, which will cut these parks off from the incoming tides, and also carry a road at that point across the pool.

The roads have been so planned that, whilst making direct routes to important points, such as the railway station, the ferry, the tramway terminus, and to the office and shops, they shall still form wherever possible curves and follow the lines of the ravines.

Another object aimed at in the laying-out of the village has been that none of the houses should have their backs to the sea. It is remarkable how little this is thought of in the building land adjoining railways, and yet I know of no estate of such an extent that ought to have more careful consideration, both on the grounds of the financial success of such a scheme, and also in the interests of the public using the land.

The general width of the roads has been fixed at 12 yards roadway and 8 feet each for footpaths, but the widest road is 12 yards for roadway and 12 feet for footpaths. I don't know whether it is a recognised rule to make footpaths as many feet wide as the roadways are yards in width. I have always found this to give a most excellent result. In order to realise the intention of leaving the parks and recreation-grounds, and at the same time to get the directness of the roads to adjacent localities, the ravines had to be spanned at several points, and in some cases where bridges have been built this has been done by means of banks of earth. In building these bridges the intention has been to add distinct objects of interest to the village.

The first of the two bridges is the one near the schools, and the park at that point. It was designed by Messrs. J. A. & Fordham, of Chester, and forms one of the most

charming features of the village. The second bridge carries Bolton Road across the ravine to its continuation to New Chester Road. This bridge was built from the designs of Messrs. William & Segar Owen, of Warrington, and it would be difficult to imagine anything more solid and strong, yet light and graceful. It is an ideal structure for the purpose for which it was designed. At the time the bridge was built we did not own and could not then readily acquire the land bounding the north-western buttresses of the bridge. The ravine therefore, for many reasons, could not be spanned by an embankment. The necessity for the continuation of Bolton Road to New Chester Road was an urgent matter that could no longer be delayed. Hence the only solution of the difficulty was the building of the bridge, which gave us the outlet we required and rendered us independent of adjoining landowners, with the result that we were able later to purchase whatever land we required to the north of Bolton Road. Whether this would have been possible without the independent outlet being first created I cannot say, but if that had appeared to us to be possible, the bridge in all probability would not have been built, and the village would have lost one of its most striking features. The total area occupied by ravines is 121,000 square yards, or about 25 acres. Adjoining one of these ravines we are erecting a gymnasium, using wood as the building material. In another, we are erecting an open-air theatre, which for want of a better name will be called the auditorium. The sloping banks of the ravine allow of a perfect arrangement of seats somewhat on the lines of the classic Greek theatres. Of course, I know it is somewhat risky to build an open-air theatre in this uncertain climate, but the view taken is this, that we may possibly rely on four months during which we shall find this theatre extremely useful, and as the cost of such an open-air theatre is certainly not more than one-quarter that of a fully-enclosed building, it appears to be a fairly economical arrangement. In addition, is it not desirable to cultivate more the capacity of our English climate for open-air summer amusement?

However, in any case it will be an interesting experiment. Adjoining another of the ravines and occupying a triangular piece of ground that otherwise could not have been profitably used, an open-air swimming-bath has been made. The shape of the bath is oval—length, 100 feet; breadth, 75 feet; 3 feet deep at one end and 7 feet 4 inches at the other; with wooden dressing-rooms placed in convenient positions.

What I may call the first public building to be erected at Port Sunlight was the Gladstone Hall, opened by the late Right Hon. W. E. Gladstone, in November 1891. This, in my unprofessional opinion, is the most appropriate village hall we have. It is simple and unpretentious, admirably adapted for the purpose for which it was designed, and most suitable and appropriate for erection in a village. The tendency at Port Sunlight has been during the last few years for our architects to become more and more elaborate in architectural design, and more and more extravagant in the use of costly building material. Although this has been done with the most happy results in the majority of cases, I rather look upon such buildings as teaching merely what can be done with unlimited money, and whilst this is very right and proper in its own way, it does not teach us so useful a lesson as the more difficult one of planning and designing simple, beautiful and inexpensive buildings suitable to village life and village means.

But Gladstone Hall has for long been too small for the needs of the village, and therefore an additional dining-hall has been built, at present devoted entirely to the use of the women and girls of the works and village. This hall is called Hulme Hall, and I certainly feel a little more at liberty to criticise it, since it was built from the designs of the same architects who designed Gladstone Hall, Messrs. William & Segar Owen, of Warrington; than whom no one has been more happy in their work at Port Sunlight, to whom also we are indebted for the quiet grace and beauty of the earliest buildings in the village which have given to it its distinctive English village character. Probably the difficulties connected with the size of Hulme Hall were greater than appear at first sight, the problem being to provide dining accommodation for not less than 1,500 people seated at small tables—say six persons at each table. The effect produced on one's mind by Hulme Hall is not that of a village building, but rather that referred to above as showing what can be done with unlimited money lavishly spent, which is perhaps the least useful lesson village architecture should teach. However, the hall answers its purpose most admirably, and should prove to be a centre of life for the village as long as it is in existence. The cooking arrangements are most admirable and perfect. A happier or brighter spectacle than the hall at noon, with the hundreds of healthy, bright girls seated at the clean, neat tables it would be difficult to find.

At about the same time that we built the Gladstone Hall we built a block of cottages, with a shop at one end of the block. This shop is now used as the village post and telegraph office, and is well worth attention. The half-timber work in this shop is solid oak, employed, as nearly as the

modern Building Acts will allow, in exactly the same way as it would have been employed had the shop been erected 300 years ago. The same remark applies practically to all the half-timber buildings at Port Sunlight, although there are, I think, one or perhaps two cases where this has not been strictly adhered to. The village stores used to be at this shop, but the growth of the village soon rendered it too small, and therefore large central shops were built from the designs of Messrs. Douglas & Fordham, of Chester. The site selected is at the corner of Bolton Road and Bridge Street, and the group of shops consists of grocery and provision shop, drapery and millinery shop, and butcher's shop. These stores are managed by the employees themselves entirely, and whatever capital is employed is provided by themselves, and whatever profits are made are divided among themselves.

Over the entire area of the three shops is the Girls' Institute, with large central hall and side classrooms, the latter formed by movable wooden screens, so that when required they can be thrown into the central hall. This is the girls' club of the village, and one of our most useful institutions. Sewing classes, ambulance classes, &c., are held here during the winter months, and in a lesser degree also during the summer. This institution does not quite correspond to the Men's Social Club, being a more educational institution than the men's club. This latter was built from the designs of Messrs. Grayson & Ould, of Liverpool, and has proved a most useful and successful building for its intended purpose. It contains the usual accommodation for billiards, games, reading, &c., inside, with a full-sized bowling-green adjoining. Opposite the men's club is a range of buildings with a "past." Its present use is as an addition to the school accommodation of the village. Prior to that it was used as a girls' restaurant on the first floor, with small confectionery shop, estate office and caretaker's rooms on the ground floor. Earlier, again, the first floor had been divided, as in those early days one-half was found to provide ample accommodation for the girls' restaurant, and the other half was available for and was used as a junior social club. None of these uses, however, is the original one for which the building was designed and built, which was to provide a series of four homes, each with twelve cubicle bedrooms and with bathrooms, parlour, living-room, kitchen and all the necessary equipment for accommodating a total of forty-eight girls, being twelve girls in each of the four homes, with provision also for matrons and staff for each house. The charge for this accommodation was 2s. 6d. a week for each girl, and this included everything except washing the girls' wearing apparel and cost of food. This charge was based upon the cost to the girls of the cheapest and usually very inferior lodgings to be obtained in the worst and most crowded adjoining districts. However, the girls objected to the idea altogether. The homes never attracted more than a dozen girls at one time. Finally they had to be closed and adapted for other uses. I believe the girls' objection was due more to the suspicion they had that they were being asked to live in what appeared to them an institution, and probably also to the ridicule of other girls, than to any other cause. They were making a respectable living, and their womanly pride preferred to be independent and to find their own lodging accommodation with some working man's family.

But the buildings of which we are most proud at Port Sunlight, both architecturally and otherwise, are the school buildings, built from the designs of Messrs. Douglas & Fordham. All the social work of the village centres round these buildings. Undenominational Divine services are held here on Sundays by our resident minister, the Rev. S. Gamble-Walker. They are used also as Sunday schools on Sunday afternoons and as day schools on week days. In addition they are in constant use for social and educational functions on week nights. Additional schools are now in process of building from the designs of Messrs. Grayson & Ould, which, when completed, will raise the school accommodation to a provision for over 1,500 scholars. A church is also being built from designs by Messrs. William & Segar Owen. I would like to describe this church to you, but I am afraid that if I attempted to do so you would be wearied by my inability to clearly convey a correct idea of it to your minds. I can only say that the aim and intention had been to produce an honest piece of work, worthy of the purpose for which it is intended, with every detail, both inside and outside, speaking of thoroughness and truth, and with such ornament only as would add dignity to the building and produce a feeling of reverence in those worshipping within or viewing it from without.

I must not forget to take you to our village inn—called Bridge Inn—built from the designs of Messrs. Grayson & Ould. It is unlicensed, and it is not intended to apply for a license for the sale of intoxicants, and it is one of our most successful and useful buildings, providing easily day accommodation for many hundreds of visitors, with a few bedrooms sufficient to meet all the demands of visitors requiring to make a longer stay in the village. Considering the difficulties to be overcome in securing all that was demanded of the architects at a cost

within the means placed at their disposal, this is certain of the successes of the village.

And now, before leaving Port Sunlight and proceeding to the little village of Thornton Cough, let us examine the types of cottages built at Port Sunlight. We have realised standard types only—the cottage and the parlour house, although we have some half-dozen cottages which have accommodation than the standard type of cottage, and a dozen houses, occupied by our clergyman, doctor, master, managers and heads of departments, which are specially for those they were designed and built to accommodate, and present no special variation from the usual moderate-sized family house.

We will therefore pass these exceptions over and ourselves to the consideration of the standard type, which really is the type for ninety-seven out of every hundred. In planning the standard type the idea has been, firstly, to provide a garden as foreground to the cottage and screen the road. These front gardens are in every case kept in order and cared for by ourselves. We have found experience that no other plan is successful in securing a charm to the village and avoiding the unsightliness of here and there the obtrusion of neglected plots of garden which would nullify the whole effect. This care by ourselves of front gardens effected at a cost of 3d. per garden per week. In addition these front gardens we have also allotment gardens to each block of cottages. These allotments the tenants cultivate themselves as vegetable gardens, or properly fence and plant with poultry, &c. These allotment gardens are placed as near as possible to each cottage, and are the very safety-valve of the village. Their use and appreciation by the villagers speaks eloquently than any words of mine could do of the absolute need for such means of healthy recreation.

The accommodation in the cottage type provides for bedrooms upstairs and living-room, kitchen, scullery, room and larder on the ground floor, with enclosed yard and usual outbuildings. Our experience leads us to believe that any variation from dimensions chosen has not been popular with the villagers. If the rooms are made larger it costs more work on the wife than she is able to devote to them, and therefore the house soon loses its tenant. On the other hand, if the rooms are smaller, they will not accommodate necessary furniture, with a like result. In fact, a work cottage must fit like a glove the wants of a tenant if it is to be a successful attempt to provide for the happiness and comfort of himself, wife and family. Having settled by experience the most suitable type of cottage, it has been adhered to in all the cottages at Port Sunlight and Thornton.

The parlour cottages differ from the ordinary cottages, having an additional bedroom on the first floor and a parlour on the ground floor. In a few cases the scullery in the parlour houses has been fitted with a kitchen grate, so that cooking could be done there, leaving the kitchen to be used as a dining-room. The general type adopted for the parlour houses has proved popular, and therefore has been settled as permanent.

The financial aspect of the village at Port Sunlight is easily told. The capital it has taken to buy the 140 acres of land to build the cottages, houses, schools, shops, institutions, &c., and including making the roads, laying out the parks has been over 350,000l.

Our standard type of cottage thirteen years ago cost 200l. each to build, and identically the same cottage in 1907 cost us 330l. to build. The parlour houses cost us then 350l. each to build, and now about 550l. each.

Upon this 350,000l. Lever Brothers, Limited, receive interest or return whatever, the rents being fixed at such amount as only to pay for rates, taxes, repairs and maintenance. The rents have had to be increased from 3s. per cottage per week to 5s. per cottage per week, owing to increased cost of maintenance of parks and roads and of the cottages themselves. The cost of repairs has gradually grown to extravagant proportions, owing to the fact that every tenant has been allowed practically any repairs he asked for. This was all because the tenants as a whole paid the total cost of repairs and maintenance; but this system does not bring it so close home to individual tenants that extravagance in requests for repairs to skilled workmen for trivial repairs is expensive. There are clear indications shown by the reduction in the number of requests during the last six months that the last raising of rents is having a good effect. From our experience, therefore, it appears that with the most economical expenditure on repairs and maintenance the rental of a cottage to cover rates, taxes, repairs and maintenance only would be 3s. 6d. per week, and of a parlour house 5s. 6d. per week, and that on such rental nothing would be available as interest on capital outlay.

Taking the value of the land at 240l. per acre, and taking ten cottages per acre as the maximum number possible on an acre, after allowing the proportion of each cottage for parks and recreation-grounds, we should have a total cost for cottage

of 354*l.*, which at 4 per cent. interest and 1 per cent. depreciation (in addition to cost of maintenance already provided for) is, say, 17*l.* 14*s.* per cottage per annum, or, say, 7*s.* per cottage per week. Adding this to the cost of rates, repairs and maintenance, we have a rental of 10*s.* 4*d.* per week as the letting value of the cottages of Port Sunlight on an ordinary commercial basis. Taking the rate of interest at 3 per cent. and of depreciation at  $\frac{1}{4}$  per cent., the 4*s.* 9*d.* per cottage per week would be sufficient to meet and consequently a gross rental of 8*s.* 3*d.* per cottage per week would be sufficient.

My object in mentioning this is to draw attention to the fact that to build a village such as Port Sunlight is not commercially possible at the present time. To ask either of the above would be to place the possibility of living in such a village out of the reach of ordinary village tenants. How can this difficulty be met? There are only two possible channels of action—cheaper land and less expensive buildings. The cost of the land for cottages is fixed by the number of cottages which can be built upon it. If the legal maximum were 12 cottages per acre, as it ought to be, it would be possible for land for cottages to reach a higher value than the present cottages would bear. The present Building Acts allow 12 cottages being crushed like sardines in a box on one acre of land. The effect of this absence of proper restrictions is in all cases to the raising of the value of the land. In Liverpool this is seen by competitions amongst builders for the best cottages, who elevate to the level of a fine art the study of how many cottages can be squeezed upon a given area. The present builder who can see his way to squeeze the most cottages on a given plot of land sees his way at the same time to the highest price for the land and so to secure it. The remedy is the restriction of the number of cottages to be built upon a given area of land—to say, twelve cottages per acre.

This will allow 400 yards of land for cottage and garden, and proportion of roads and open spaces for parks and recreation-grounds. This is the maximum limit possible for the maintenance of healthy life. A limit of ten cottages per acre, 400 yards per cottage, would be better.

The next consideration is the cost of building, and I venture to suggest that there is here a magnificent field worthy of the attention of our best architects. This subject should not be left to the unaided efforts of what we often call the jerry-builder, a man who is, in my opinion, a useful member of society—more sinned against than sinning.

The so-called jerry-builder has to make the most of the most impossible position—to satisfy the demands of the market for cheap dwellings, regardless of consequences—and I think that, building upon dear land, he does all that can be done with the materials at his disposal. If our best architects only come to his assistance by studying the present-day requirements to be provided for in dwelling-houses, the cheapest materials for the purpose, the preparation of the same machinery, as far as possible, rather than by hand-labour; by the saving to be effected by the erection of dwellings in large masses rather than singly, and to do so with effect and less monotony than by building as at present; in fact, to raise architecture in relation to the dwellings of the masses on to broad, comprehensive lines, so as to rest upon the only true basis that architecture can ever occupy—the logic of the requirements of the age with economy, simplicity and character. Modern domestic architecture requires to put itself to the requirements of the twentieth century, in the same way that naval architecture has done in shipbuilding—to accomplish as much by disregarding traditions, as to building materials, in supplying the demand for dwellings for the masses of the people, as naval architecture has done by disregarding traditions, as to shipbuilding materials, in supplying the present-day demands for ships.

We know that for certain buildings which must be monumental and important, we are not likely to discover better materials than stone, granite, or marble. But dwellings for the masses of the people need not be monumental. They can be inexpensively built to stand absolutely sound, fire-proof and sanitary for, say, fifty or sixty years, they can better supply the present-day requirements than if, by the added cost, they were built to stand good for 300 years. The changing life of our citizens, the necessity that is laid upon them to follow their employment wherever it may lead them, the fact that our experience teaches us that in fifty or sixty years the site of cottages may in all probability be wanted for other purposes—all point to the present-day requirements in building being not for cottages to stand hundreds of years, but for cottages to stand fifty or sixty years. Understand, I am not speaking of the building of mansions, say, from 70*l.* a year rent and upwards. I am speaking of cottages, and what for want of a better word I call "parlour houses," the rentals being from a few shillings up to say 30*l.* or 40*l.* a year. I know of no greater service than the designing of economical cottages and small houses, unfettered by tradition as to material to be used, and

guided only by the wants of the age for economical, sanitary, healthy houses, to endure for fifty or sixty years only.

We will now pay a short visit to the village of Thornton Hough. Here the problem was not how to build an entirely new village, but how to rebuild an old one. The exteriors of some of the old cottages in the village were very picturesque when seen in fine weather, but unfortunately, the more picturesque the exterior appearance, the more dirty, dark, damp, unhealthy, and at variance with all ideas of common decency was the interior. The villagers in many instances, but not every one, were attached to these old ruins. I well remember one case where the tenants, a farm labourer and his wife, had brought up a family of ten children in a cottage with one bedroom only. The thatched roof was falling in and the walls were bulging out. A son-in-law of the tenants was the village carpenter, and I referred the old lady to him to satisfy her that nothing but pulling down was possible. He expressed his inability to do anything, saying in his own emphatic way, "If yer touch the roof ye'll push the walls out, and if yer touch the walls ye'll have the roof down."

This unwillingness to move did not apply to all cases. I remember one tenant, a widow woman with one son, asking me if I could not build her another bedroom to her cottage, as her lad was growing up now and they had both to sleep in the same room. She then proceeded to inform me that he was over twenty. There were other cases even worse than this as far as mixing the sexes in single bedrooms was concerned, and cottages worse than the one with roof and walls falling down. Such cottages were the most picturesque externally. However, all difficulties in the end were overcome. Only the irreclaimable cottages were pulled down and new cottages built in their place. Cottages offering the slightest possibility of reformation were altered, repaired, and adapted to modern requirements. The new cottages were not always built on the site of those pulled down, but as far as possible this was done, so as to preserve the general outline of the village.

A score or more of additional cottages have been added to the village to supply the growing need of the agricultural and farm labourers of the parish.

I have confined the tenancy of the cottages to the village labourers, and in consequence have only about 1 per cent. of direct return on the investment. I have, however, the satisfaction of knowing—if that is any satisfaction—that under present building possibilities however "jerry" and however plain and ugly I might have built, at the rentals which village labourers can afford to pay, the result as an investment would have been little different. To raise the rents would, in the majority of cases, be to force the original village population away, and to replace them with a different class of tenant entirely. But, indirectly, I believe I have full and ample return, partly in the value of the farms I have in the parish, which would be seriously depreciated if farm labourers could not be housed in the village; and, secondly, in the pleasure it has given to me to do what it appeared to me ought to be done for those living in the village.

Messrs. William & Segar Owen, of Warrington; Grayson & Ould, of Liverpool; and Douglas & Fordham, of Chester, are the architects I was fortunate enough to secure to design and carry out the work. The same general plan or type of cottage has been adopted at Thornton as at Port Sunlight, and the same provision for gardens and recreation-grounds has been made.

And now allow me to explain, in order that you may understand my position and work better, that I have always wished that I had been an architect. I have been building since when, at nine years of age, a lean-to rabbit-hutch absorbed all my spare time for that year. The following year this rabbit-hutch appeared to be capable of extension, and it was pulled down and rebuilt on a more extensive scale, allowing a number of small boys to stand upright inside the hutch. The third year saw a further development in carrying out a startling idea—that of covering the roof with soil to the depth of about six inches and planting oats therein, with the object of raising food for the ever-increasing stock of rabbits. But, alas! "the best laid plans of men and mice gang aft agley," to say nothing of those of architects and builders; for although the corn grew luxuriantly in the early spring, it all withered away in the summer heat; and so this economy of space, which, had it proved practicable, might have done so much for distressed agriculture, had to be abandoned. Nothing discouraged, as far as my building instincts were concerned, the year following I built a pigeon-cote; and so on, each and every year finding me engaged in some building operation, right up to the present time.

Gentlemen, there is no career that opens up such immense possibilities for influencing the world in which we live as that of the architect. The best and most reliable records of the earliest stages of civilisation in the world are architectural. It is true we have the stone and flint implement age, but although they teach us that their users were able to protect themselves from foes, we learn little of their higher or home life. In the

case of the cave-dwellers the incipient craving for buildings does show itself, it is true, but only very slightly. It is not until the first architect appears on the scene that man comes within the reach of a higher life. There can be no possibility of doubt that the architect was the first and most important link in the chain of art workers that have raised us to our present state of civilisation. The art of the painter is a most important one, but it is clear that until there were suitable buildings in which to place them paintings on walls or canvas were impossible. And yet architecture is one of the least remunerative of the professions. If an architect does his duty to himself and client and supplies full necessary detail drawings to the builders, if he carefully and conscientiously supervises the progress of the building during erection, he will have a very small sum left for his own personal remuneration after paying the salaries of draughtsmen and assistants. And it is to the credit of the architectural profession that it does contain a body of men who maintain a high level for their profession, as free as the requirements of life will permit from unworthy thoughts of personal remuneration. And, with a very few exceptions, this appears to have been always the case with architects in all countries and all ages.

Why it should be so I fail to see, yet it does appear to me from my own observation that, attention once directed to money-making as an aim and object, art vanishes. No, if money-making is to be the aim and ambition of life, then leave architecture and become soap-boilers, sugar-boilers, cotton-spinners, manufacturers, bankers, shipowners, merchants—anything and everything almost. It is true many of these latter reach the Bankruptcy Court; and I hope few architects arrive there. Still, if money-making is the highest aim of life, then architecture is not the calling to follow. But money-making is not the highest object of life, but service to our fellow-men; and in my humble opinion an architect's career is one of the most serviceable in the whole range of honourable callings.

Since it has not been my good fortune to be trained to the honourable profession of an architect, and since my instincts all lead me in that direction, I have had to be content to follow, but at a most respectful distance, in the company of architects, and to build under their guidance and direction what little building I have done. No doubt I have led them into many errors by insisting on my own way being followed as against their trained and mature judgment. None the less on that account I hope to remain always on the most friendly footing with all architects, and that my love of the profession, with a lifelong devotion to its aims and ambitions, will make them

To my faults a little blind,  
To my virtues ever kind.

For myself, I thank most heartily and sincerely every architect who has carried into effect, and freed from their native blemishes and defects, and made beautiful my own crude and untrained ideas.

Mr. G. H. FELLOWES-PRYNNE, who proposed a vote of thanks to the author of the paper, said it was refreshing to hear a layman discourse on possibilities in architecture. Both Mr. Lever and his architects were to be congratulated on their work. The dwellings in Port Sunlight were admirable. The general scheme showed that the pleasures as well as the living needs of life had received attention. The allotment gardens must prove a great attraction to the men after their daily toil. The innate love of flowers and the care necessary for their cultivation must tend to raise the higher instincts of man. There must have been great difficulties in the scheme, and to-day the increased cost of material would make such a development still more difficult. Of late it was almost impossible for an architect to give an approximate estimate of cost. From the commercial aspect it would seem that any similar undertaking would be a failure. In the spirit of philanthropy success would be certain. Mr. Lever's advice regarding building for only sixty or seventy years few architects would agree upon. In the planning of cottages architects felt it was necessary to build to the best of their ability, and their work would endure longer than seventy years. They must all have felt grateful for his kind words and his appreciation of the art of architecture and the work of his own architects.

Mr. H. T. HARE, who seconded the vote, said Messrs. Lever Bros. appeared to have had a magnificent opportunity in the development of Port Sunlight. The piece of ground certainly lent itself most admirably for picturesque treatment. The scheme in every way was far ahead of any other that had been undertaken in a manufacturing district. The promoters had the foresight to see that it was not necessary for each building to pay 5 per cent., and although they had not the satisfaction of an adequate return directly from the letting of the houses, yet they must feel very greatly the benefit of their workpeople living in good and sanitary houses. Such dwellings must attract better workpeople.

Messrs. S. VACHER, ANDERSON, GRAHAM, W. B. HOPKINS,

F. G. HOOPER, H. A. SATCHELL, J. T. ARUNDEL and BOLTON also spoke.

Mr. LEVER, in returning thanks, said their villages a birth rate double and a death rate half that in proportion to the United Kingdom. Allowance, however, must be made for the fact that they had many young people as tenants. In their villages they had to conform to the local by-laws. They were not subject to trade unionism. No individual manufacturer could interfere in the latter. He despaired of building cottages for tenants who could only pay 1s. 6d. per week, but he was sure that prices in building materials could be cheapened, and that it was possible to plan good and sanitary houses for 4s. to 5s. per week. The question of the cost of land for development such as Port Sunlight was a matter of policy and foresight.

## SUSSEX ARCHÆOLOGICAL SOCIETY

THE annual general meeting of the Sussex Archaeological Society was held on the 19th inst., in the lecture hall at Lewes Town Hall. The Rev. Canon Cooper, who presided, alluded to the recent excavations at Lewes Priory, which, he said, had been undertaken with the most earnest interest. They had with them Mr. St. John Hope, the greatest authority on the subject of priory excavations in England, and part of the excavations they would hear from him. The results of the work had been very considerable, and the Society's efforts were not quite equal to it. There had been a great deal in their history that year in the opening of the exhibition of Sussex iron in Lewes Castle, and for which they owe thanks to Mr. Dawson. He had a letter from him suggesting that the Society should hold an exhibition illustrating the ancient staple industries of Sussex. Now that the Society has on exhibition a good representative collection of Sussex ironwork it would be a good opportunity to hold further and to hold an exhibition (under one roof) of other much-spoken-of Sussex industries, such as the pottery and glass-making, about which very little seems generally known. Mr. Dawson has some specimens of Sussex pottery and glass which he would be pleased to lend to the exhibition, and other people would also be pleased to lend and present specimens. He suggested that the exhibition be held (with the permission of the hon. curator) in the tower of the Barbican Gate House, Lewes Castle, where there are already some valuable specimens of Sussex pottery, to be removed and stored. The collection of specimens should be commenced at once, so as to be on view during the coming summer and autumn, and all members of the Society and others should be invited to lend and present specimens. The cases of ironwork lent by the South Kensington Museum will be removed early in April, but their place will be then occupied with other interesting specimens of Sussex ironwork which are about to be lent and presented to the Society. Probably the same gentlemen who are on the ironwork sub-committee will be willing to act. Continuing, the chairman said another point in the programme was the reading by Mr. Dawson of a paper on the "Barons of the Cinque Ports," which resulted in the barons of the Cinque Ports receiving an invitation to attend the Coronation. The chairman also alluded to the loss of the Society had sustained in the death of Mr. J. L. André, who was a man of very large information and experience in archaeology, and always most kind in putting that information and experience at the service of the Society. It was really a very great loss to them, and they were sorry also that the valuable collection had been dispersed. He congratulated the Society on its prosperity, it having made a gain on the year of seventeen members.

The first paper was read by Mr. W. H. St. John Hope, "The Recent Excavations at Lewes Priory." Through the exertions of Mr. Michell Whitley and the courtesy of Mr. Blaker, who owned the site, and of Mr. Courthope, who was the lessee, it had been possible, said Mr. Hope, to take up excavations where they were left off. The excavations brought to light the foundations of a very remarkable structure, viz. the infirmary of the priory. From the remains of the building it would appear that it was of the Norman period, belonging to the main building of the priory, and dating about the first quarter of the twelfth century. It was remarkable for the massive nature of the whole place. So far as experience went, they had not the like in that country; and far as foreign monasteries were concerned, he did not remember seeing anything like it abroad. There were extraordinary evidences of its destruction. The method which had been employed in demolishing it had been to support the walls with posts, then dig trenches, and afterwards burn the posts, which gave way under the walls. The walls had been overthrown at all angles. He had no doubt in his mind that the building was the first infirmary of the priory. The

of the ancient infirmary did not quite correspond to those of our modern buildings of that name. The monastic idea was that sick brethren should go there, but also a place for the infirm brethren, also for those suffering from the process of bleeding—a remedy so generally used in ancient times. The building was about 100 feet long and the nave was 26 feet wide. There was an upper story to the nave. Investigations showed that there had been considerable extensions to the infirmary, consisting of a hall about 113 feet long and 50 feet wide, divided by arches; also that there had been two small buildings, apparently the buttery, pantry and kitchen. These rooms had evidently taken place about the middle of the twelfth century. One of the marked differences between this infirmary and the first one was that no such violence was employed in the demolition of the second as had been employed in the case of the first, but that of the second there were no architectural fragments whatever. Mr. Hope was much applauded.

The next paper was on "Trotton Church and its Brasses," by Mr. P. M. Johnston. Mr. Johnston explained that there was one of the most remote of Sussex villages, being in Hampshire borders, and having a population of 250. The church now standing was probably erected by Mary de St. Amand, the elder, who died in 1310, and whose brass was in the nave. Another brass, which was hardly inferior to the best, was that describing Baron de Camoys and his wife, the widow of Harry Hotspur, mentioned by Shakespeare in "Henry the Fifth," and her son.

Garraway Rice gave some notes relating to iron work and ironwork from Sussex wills proved in the Prerogative Court of Canterbury from 1383 to 1558 and from 1649 to 1700.

The information gleaned related to personal history, arms, furniture, wearing apparel, jewellery, tombs, ecclesiastical vestments, &c. An extract, dated 1504, related to a ton of the value of 66s. 8d.

The last paper was on "Ancient Cultivation," and was read by Reginald Blaker. He explained the method of the cultivation of land at the time of Domesday. Examples of British cultivation abounded in the parish of St. Anne, in the neighbourhood of Houndean and Ashcombe, and on the estate of Lord Abergavenny and Sir George Shiffner. On the near Lewes tumuli were numerous. Other examples of ancient cultivations were found in the parish of South Malling, in the parish of Berham and Ranscombe farms, and on the north-west of Otford Bottom, in the valley called Bible Bottom, and in the Downs between that valley and the rifle-range. None of the ancient cultivations referred to were in length or width to the open fields of an English farmer, and he thought they could dismiss the idea that they were a manorial association. They might infer that the slips, and terraces were cultivated by a system of co-operative ploughing through successive seasons. The tribes were not under a manorial lord, but under a chief, and might not these ancient cultivations be examples of the system to which the Roman chronicles referred?

Other papers which were down on the agenda, "On the Specimens of Martel-de-fer found at Lewes Priory," by Mr. P. Boyson, and "The Churchwardens' Accounts of St. Andrew's, Lewes," by Mr. H. Michell Whitley, were not read. Mr. Boyson explained that he had been informed by two antiquaries that the specimens he had proposed to speak about were what he had thought them to be.

## THE AUSTRALIAN CAPITAL.

Our CORRESPONDENT of the *Daily Chronicle*, writing from Melbourne on February 12, says:—Yesterday the Government left Melbourne on a fortnight's tour of the suggested sites for the wonderful city which is not only to be the capital of Australia, but the embodiment of the noblest achievements of architecture and of enlightened city government. The travail of past centuries has produced. The undergrounds unique, and will attract notice the wide world over. Sixty-six legislators will have to cover in about twelve months 282 miles by railroad, 200 miles by coach, and untold miles on foot, in order to see fourteen or fifteen districts in New South Wales outside a 100-mile radius of Sydney, as laid down in the Constitution. In about a month or six weeks when the tariff is disposed of—the House of Representatives, to the number of seventy-five, will attempt to pass the same ordeal. As a mere feat of endurance the task is amazing; as a means of satisfying State jealousies and allaying the keen anxiety of the Federal politicians to secure themselves from Melbourne influences it is unavoidable. It must be remembered that this question is mixed up with the main question upon which the decision as to whether New South Wales should come into the Federation or not largely hinged. It is again provided that the Federal Parliament should sit in the Federal territory from within New South Wales, but

outside a 100-mile radius of Sydney, as already indicated. The bargain also provided that until the site was selected and the capital ready for occupation the Parliament should sit at Melbourne, in Victoria. The rivalries between New South Wales and Victoria being so keen and so numerous in their aspects, it can readily be imagined that from the moment that the Federal Parliament met in May last the legislators from the Mother State applied themselves to the task of hurrying forward the selection of the Federal capital. Melbourne, with its Protectionist atmosphere and its strong and critical daily press, ever anxious to push the scalpel deep into political flesh, must be abandoned as the heart of the Federation with all speed.

Nothing was done to frustrate the wishes of the New South Welshmen. The Federal Government and the State Government, it is true, declined to exhibit any preference for any particular spot. Both, however, did their best to secure every available data upon which the members of Parliament could base a judgment, the *pièce de résistance* being a voluminous and able report by Mr. Oliver, who, as New South Wales State Commissioner, visited in 1899-1900 all the sites offered. The Federal Government, further, promised that at the earliest opportunity Parliament should have facilities for a personal inspection of areas. The prolongation of the debate on the tariff for over three months in the House of Representatives rendered it impossible for both branches of the legislature to go on tour together. Hence it comes about that the Senate's extraordinary legislative picnic, begun yesterday, is really but the partial fulfilment of an honourable triple compact made between the Government, the Federal Parliament and the people of New South Wales.

The sites to be definitely inspected by the Senate are thirteen in number, although fifteen have been listed from those offered. The following is a list, with the distance between each site and the capitals of the four principal States:—

### Distance in Miles.

Site.	To Sydney.	To Melbourne.	To Adelaide.	To Brisbane.
1. Albury . . . . .	386	190	700	900
2. Bathurst . . . . .	145	483	966	868
3. Bombala . . . . .	325	573	804	1,048
4. Braidwood . . . . .	187	576	1,271	933

Next to the average temperature and water supply of a district, this question of distance from the four capitals will be a dominating factor in the selection to be made from the list. A West Australian under any circumstances must be four or five days' journey from the seat of Government, and a Tasmanian three or four. But the Queenslander, the Sydneysider and the Victorian object to being more than a day or two days' journey from the capital—and they possess the preponderating influence in the decision. Parliament will religiously inspect as many of the offered sites as its patience will permit, but it is understood here that the contest is really between Bombala-Eden, Yass and Orange. A few facts concerning these three localities may interest English readers:—

Bombala-Eden is a charming district, having a mean temperature in the summer of 66.1 degrees, and in the winter of 43.6 degrees; a maximum altitude of 2,800 feet and a minimum of 2,250 feet; a rainfall average for the past ten years of 29 inches. A good supply of pure water can be secured from Delegha river, and the trend of the country affords excellent natural drainage facilities. There are in the vicinity unlimited quantities of good building material. The site is sixty miles from Cooma station on the State railway system.

Yass is in direct connection with the trunk railway system. It has a mean temperature in the summer of 69.9 deg., and in the winter of 55.2 deg. It has an altitude of 1,800 feet and a rainfall of 24.20 inches. Both water-supply and drainage conditions are good and the supply of building materials ample. Orange or Canobolas is also on one of the State railway main lines. It has a mean summer temperature of 63 deg., and during the rest of the year of 46 deg. The mean altitude is 3,000 feet, but the Canobolas Mountain Peak towers up 4,500 feet. The rainfall totals 39½ inches. The water-supply is specially good and the drainage facilities ample. The district is peculiarly rich in building materials.

These bald but important facts are merely indications as to the practicability of the sites for utilisation for city purposes. Much has, however, yet to be learned about them before any estimate can be arrived at as to the cost of acquiring in one of

the localities 100 square miles of land to be the unalienable property of federated Australia for all time, and of erecting thereon a city which shall gratify the aspirations of a sensitive people. Assuming a selection were made this or next year, it will be a good five years before the New Jerusalem of Australia will flash its jewels beneath the noonday sun.

### TRAMWAY LEGISLATION.\*

**I**N the general survey of the position which electric traction has reached to-day, the first, I think, most prominent point is the utterly tangled and belated condition of tramway legislation.

I have entitled this paper "Tubes, Trams, and Trains," and when we look at the condition of the law and parliamentary procedure, we find that under each branch different laws and practices exist. If we propose to construct a tramway the General Tramways Act of 1870, with its purchase clause 43 and, incidentally, Standing Order 22, block our way. Light railways are under a different law, but with difficulties peculiarly their own. A railway stands on a still different footing, and it possesses the distinct privilege of coming before Parliament on its merits, an advantage hitherto denied to tramway undertakings. And here we encounter a curious anomaly. It has been specially recommended by the joint committee of both Houses which sat last year that the London problem should be largely met by means of underground lines within the more congested parts of "London and its immediate suburbs," joined up for purposes of interchange of traffic with electric surface tramways, &c., in the suburban districts. To do this under existing arrangements the surface lines must be promoted as tramways, while the tunnels, although designed to form integral portions of the through surface, must be promoted as railways. For the one, the two-thirds consent of the various local authorities concerned must be obtained by previous negotiation, or the project will fail under the Standing Orders, while a railway, whether it be "tube" or "shallow tunnel," comes at once into Court on its merits, and cannot be wrecked on the threshold by interested opponents or obstructive municipalities. This difference between a tramway and a railway is clearly indicated in the words of Lord Morley, chairman of committees in the House of Lords, when he says it is not right that anybody should be able to prevent a scheme from coming before Parliament. He further shows how unfairly the double veto of the road and local authorities bears on promoters, and how contrary to the public interest it is that local authorities should be able to exact onerous conditions as the price of their consent. I join with everyone who has recently spoken or written on the subject, that one of the greatest obstacles to electric progress in Great Britain has been the discouragement presented on the one hand to scientific and manufacturing skill, and on the other hand to financial enterprise, by the shackles and hindrances which legislation has imposed.

It has been recently urged that the Tramways Act of 1870 had in view horse traction alone, and that it was also anticipated that no tramway would traverse the territory of more than one municipal or local authority. This is probably true; but the statement makes the plea all the stronger for an alteration in the law.

The Tramways Act of 1870 to-day makes the promotion of electric tramways most arduous, and, indeed, in some respects impossible, and even my own various and to some extent successful labours in breaking down the twenty-one years purchase clause, and in struggling against the demands of Standing Order No. 22, afford no argument in support of the existing conditions. As is well known, I have had to encounter negotiations with a full score of local authorities in the promotion of one tramway Bill. Objections reasonable and unreasonable, conditions onerous and even prohibitive, have had to be fought out, not in the fair and open tribunal of a parliamentary committee, but in local caucuses and conclaves where the pressure of the knowledge that one hostile authority might wreck the Bill has given boldness to unconscionable demands for conditions. And the bitter irony of the thing is that even although we may with hard fighting and heavy expenditure pass portions of a scheme on Standing Orders, there has been no precedent yet created under which a committee of Parliament has sanctioned the removal of the general veto possessed by such authority, or has in the teeth of the opposition of even one local authority passed the preamble, and allowed the Bill to proceed. This is, indeed, the very anarchy of legislation.

There has been evidence of some gradual change of public feeling, as electric lines have been opened up to traffic and the real benefits of the service have become manifest. But the irreconcilable opponent of tramways in any shape still exists, and the hardness of heart of local authorities in striving to

impose impossible conditions is as yet little abated. wonder is it that Great Britain lags behind the world in invention and general electric development, and that when we do succeed in getting a lighting or a tramway authorised, we have had perforce to go to the United States for much of the plant and machinery special to such takings.

Yet, although I speak thus, I am able to claim a fair amount of work accomplished in this backward island of ours something to have been instrumental in awakening I think a knowledge of what electric traction can accomplish something to have shown that to-day upon sixteen miles of London United Electric Tramways it is possible to record of passengers equal to more than a twentieth part of total passengers carried on the thousand miles of tram in Great Britain as recently as 1895. This is a pregnant worthy the attention of anyone who seeks to disparage the capacity of electric cars such as those on our system, perhaps even ventures to suggest that a service of other vehicles such as 'buses, or, as now proposed, steam 'buses might all give double or more the accommodation to passengers the same route as our electric tramways. It is overlooked the ingenious writers who are hoping for great things some new steam omnibus that while, as they say, steam cars have a record of twenty years' failure behind them, omnibuses have a record of about seventy years' failure, as one familiar with the endeavours of Mr. Hancock and Mr. Russell well know. I may commend to the attention of such people the excellent argument of Mr. St. John Hanbury in a letter to the *Daily Chronicle* (an argument which I also often suggested) that the streets of London are congested because we have adhered to horse vehicles and 'buses, the absence of tramways which crowds the London streets, the writer—a somewhat Hibernian expression, but under the truth.

We have seen that in 1895 the total number of passengers carried over the tramways of Great Britain and Ireland—1,150 miles of line—amounted to 650 millions, about one of these being in the metropolitan area. On our 16 miles of electric tramways in West London we are to-day carrying passengers whose total, when a full year of electric work has been completed, will not fall short of 35 millions, being 2 millions per annum per route mile against a total for Great Britain, seven years ago, of under 600,000 per mile.

Notwithstanding this conspicuous success, first, in coming the inertia as well as the more active opposition multitude of local authorities, and next, in demonstrating London the magnificent service that a well-organised electric tramway can give to the public, there can be no complete solution of the great London problem—there can be no first seen—so long as the existing legislation and parliamentary conditions exist, and it is satisfactory to know that the Government has been so far aroused to the need for some action, a special departmental committee of seven able and experienced gentlemen has been appointed to report on the whole subject.

In the Act granted by Parliament to the London United Tramways, Limited, in 1898, a clause was inserted by Treasury giving certain powers to the authorities of Greenwich observatories, which for a time threatened to be a very serious obstacle indeed to every electric proposition within the metropolitan area. From early 1899 till the latter part of 1900 negotiations, experiments, &c., were carried on the way that the construction of the London United Tramways system was delayed. Even in 1900 no substantial progress towards settlement of the claims of these observatories had been made, and pending a settlement, the whole question of electric tramways in London had come to a deadlock. It is customary for the Metropolitan and the Metropolitan District Railway for their delay in proceeding to the electrification of their line. But I have no hesitation in saying that until the directors of the London United Tramways took the definite step in April 1901 of approaching the Treasury on the observatory question, no real progress with the electrification of the earlier underground railways could have been made. The South London, the Waterloo and City, and the Central London railways had obtained their powers to be in operation before this claim arose, or they too would have had their progress arrested, while even as going on they would have been liable to ridiculous interference if the Metropolitan and Greenwich had had their own way. It fell upon the London United Tramways Company to provide the cash consideration of which this obstacle was removed. Although the sacrifice was great the case was so clamant that the London United Tramways Company, without assistance from any of the various other electric-traction concerns in London, undertook the obligation to pay a sum of 10,000*l.*, and thereby brushed aside the difficulty and earned the thanks of every electric tramway or railway promoter, director and shareholder within the area of London.

Another point of Government interference already referred to, which threatens to give great trouble to electric undertakings

\* From the paper by Mr. J. Clifton Robinson, M.I.E.E., read before the Society of Arts.

for light, power or traction, throughout the whole of the country. We have had to assent to these although of opinion that they are not necessary for the face, while certainly harmful to tramway enterprise. It is an attempt to throw on companies and corporations an unreasonable burden, which properly belongs to the Government itself. I am the more decided in making this statement because in the Observatory case the reliance we were placed on the Board of Trade as standing between us and the Surveyor's authorities completely failed us, and after a negotiation the Board of Trade, as possessing no powers, remained practically helpless.

Attention may be drawn to another sign of danger to the nation as regards underground lines, whether "tubes" of varying depths or "shallow railways" under the streets, &c. At a meeting of the Auctioneers' Institute of the Kingdom, held on December 4 last, Mr. G. M. Freeman, C., read a paper on "The Problem of the Tubes," principally with the landowners' position in the foreground. The learned counsel pointed out that Parliament had dealt with such tunnels under streets as if they belonged to the local road authority, and the point of fact only such a depth is vested in the authority as is needful to enable sewers, &c., to be laid, the road to be kept in repair, &c., while all the rest belongs to the adjoining landowners. After showing the further rights of landowners are in such cases as unaltered under the Lands Clauses Acts, Mr. Freeman proceeded to say, "The only question in this case is, what is the best way of enforcing this claim" of the adjoining owner? There is here hung out a danger signal to promoters of underground lines would do well to take note of. The illustration may be given. Mr. Freeman says, "In former times, owing to the great value of the surface, it was customary to sink double basements extending under the street between two buildings of the same owners on either side of the street. The tube railways are carried at different levels, and it might be that their construction would be impossible hereafter to carry out double basements as has been done previously. Here is a case of damage, but its amount depends on the date of the works which will be required."

Especially in land, cannot be pushed to extremes, as in a hypothetical case, such as was hinted at, as "Perhaps to deepen my cellar some day," or even, "Perhaps to the opposite house, and may wish to make a subway to be pushed, the case of London underground commissions will be made all the harder."

of value to find that Mr. Freeman, although pointing out in directions in which claims for compensation might be opposed the idea of one of the speakers, that the distance within which a *locus standi* should be given extended to 350 yards, expressing his view that a 300 yards would not be inadequate. "They could not have an illimitable zone." For this assurance, much

## EDWARD VII. STREET.

At a meeting of the County Council on Tuesday the Building Act committee submitted the following report:—We have been in communication with the improvements committee with regard to the name to be given to the new street, in course of construction from Holborn to the Strand. The improvements committee express the opinion that the straight portion of the thoroughfare, which will be at Holborn and terminate at the site of the Theatre, and the new crescent street, which will be the main thoroughfare with the Strand, should have distinct names. In this we quite concur. To assign names to such important new thoroughfares is no easy matter. Naturally, the subject has excited much interest without the Council, and in all more than eighty suggestions have been suggested, but of these it is only necessary to mention a few. Mr. Frederic Harrison's original proposal, "Broadway," has its advocates. Again, it was suggested that the millenary of Alfred the Great might be commemorated. It was pointed out that the settlement of the City here outside the City walls, and on a site which was the modern parish of St. Clement Danes, and was known by the old and narrow thoroughfare (now to be widened) bearing the characteristically Danish name of "Danes Street," was most probably due to the peace made by King Alfred with the Danes. The names originally proposed were 'King Alfred Street' and 'Danes

Crescent.' Another proposal was to name the straight street after Shakespeare, not only one of the greatest of Englishmen, but a name naturally associated with the numerous theatres in the neighbourhood, while the improvements committee point out that, as the actual work of the improvement was begun in the year which marked the commencement of the reign of the present Sovereign, it would be a fitting opportunity for commemorating that important event by naming the street 'Edward VII. Street,' subject to this course meeting with the approval of the Sovereign. With this suggestion we are entirely in agreement. It was also suggested that it would be suitable to commemorate the Queen by naming the other street 'Alexandra Crescent.' To this name, however, we were constrained to object, owing to the fact that it is already in use in many places in London. The improvements committee then informed us that in their opinion the name 'Danes Crescent' would not only preserve the historic associations of the locality, but at the same time be a compliment to Her Majesty as a Danish Princess. With this suggestion we cannot agree, but think that as the Council has already allotted a site in the Strand opposite the eastern extremity of the crescent for the memorial to Mr. Gladstone, it is more appropriate that the name should be Gladstone Crescent. We recommend (a) that subject to the approval of His Majesty being obtained to the proposal, the new main street to be constructed from Holborn to the Strand be named 'Edward VII. Street'; (b) that the new crescent street to connect the proposed main street from Holborn to the Strand with the Strand at Wellington Street and the Law Courts, be named 'Gladstone Crescent.'

## TESSERÆ.

### Grouping in Painting.

ALL improvements in composition from the infancy of painting to its full maturity are the result of the gradual discovery of the principles by which nature makes assemblages of objects agreeable to the eye, sometimes by giving variety to regular forms or groups, sometimes by giving regularity to forms in themselves irregular and always by giving unity to multitude, and subordination of many objects to one or to a few; and in all that relates to forms or to lines it is chiefly perspective that does these things. Linear perspective is, therefore, the basis of linear grouping, and until its laws were well understood composition remained imperfect, whatever beauties it occasionally put forth being accidentally obtained by the lucky chance of the correct copying of the appearances of nature, but with no certainty of repetition, the causes of the appearances not being understood. Of composition therefore before the laws of perspective were known, it is more to be wondered at that we often find it as agreeable as it is than that we do not find it better. In the works of Giotto we see beautiful combinations of lines and forms, though these excellences are rarely sustained through an entire picture; but when a knowledge of perspective had settled the true principles of grouping with reference to background, we find extended composition well developed.

### Influence of Ancient Architecture Abroad.

The nature of European men has its roots intertwined with the past, and can only be developed by allowing those roots to remain undisturbed while the process of development is going on, until that perfect ripeness of the seed which carries with it a life independent of the root. This vital connection with the past is much more vividly felt on the Continent than in England, where we have to recall it by an effort of memory and reflection, for though our English life is in its core intensely traditional, Protestantism and commerce have modernised the face of the land and the aspects of society in a far greater degree than in any continental country. "Abroad," says Ruskin, "a building of the eighth or tenth century stands ruinous in the open street; the children play around it, the peasants heap their corn in it, the buildings of yesterday nestle about it and fit their new stones in its rents, and tremble in sympathy as it trembles. No one wonders at it or thinks of it as separate and of another time; we feel the ancient world to be a real thing, and one with the new; antiquity is no dream, it is rather the children playing about the old stones that are the dream. But all is continuous, and the words 'from generation to generation' understandable here."

### Palladio and Piling.

About building in water Palladio says but little. He says the length of the pile must be an eighth part of the height of the intended wall to be erected on it. This cannot be considered to be an invariable maximum. So long as it is driven to the solid, whether it is a fourth or a fourteenth part of the proportion given by Palladio, that will be the proper length. He orders the piles to be driven so contiguous to one another

that no others can be set between them; but this is certainly a needless waste, as a due lateral or transverse compression of the soil is better obtained by moderate intervals, than such close ones as to exude the earth. Their diameter was to be a twelfth part of their length, by which rule a pile 12 feet long must be a foot square. A much smaller diameter would be preferable, as every builder knows what an immense weight a perpendicular post or column will sustain, when prevented from leaving its perpendicularity. He preferred repeated gentle blows to violent ones, for driving them, and with reason; he also drove them under the inner or cross walls, which ought never to be omitted when they are to be carried up to the same height or have heavy partitions or floors to sustain. Palladio made his foundation-wall twice the thickness of the superincumbent one (which is a better proportion than that of Vitruvius), and diminished upwards. The ancients, he observed, paved the trench with stone, but in his time they used plank. He also recommends some foundations to be arched, but leaves us in the dark as to the manner.

### Greek Columns.

So far from employing pedestals to columns, which some have considered as forming as essential a part of an order as the entablature, the Greeks placed their columns immediately on the floor or uppermost step, the whole temple being generally raised on a low platform, to which the ascent was usually by three deep steps or gradini, serving as a base to the edifice; the depth of the steps was not accommodated to the human stature, but regulated so as to accord with the dimensions of the column. It is therefore conjectured that either a sloping platform of wood or lesser steps of the same material were employed as the real ascent to the temple. The Greeks invariably placed their columns singly, never in pairs, as has frequently been done by modern architects, and which, if not utterly indefensible, ought never to be resorted to unless required by positive necessity; for instance, where wider intercolumns than the scale of the order will properly admit are required, in which case, by affording additional support to the entablature, coupled columns not only excuse the width of the intervals, but take away the air of poverty that would result from single columns placed at the same distance from each other. Coupled columns are most of all offensive when forming a prostyle colonnade, especially if it be one with a pediment, since that disposition approximates so closely to that of the front of an ancient temple as to render any incongruity the more striking.

### Sudeley Castle.

Sudeley Castle is about a quarter of a mile south-east from Winchcombe, and appears now more like a castellated mansion than a baronial fortress. This building was erected by Ralph Lord Boteler, a prominent man, "a famous man of warre," as Leland says, and part of the windows here are said to have been glazed with beryl. Sudeley afterwards fell into the hands of the crown and so continued till the reign of Edward VI., when it was granted to Sir Thomas Seymour, who, having restored its neglected buildings, retired hither with Catherine Parr, the queen dowager, who had honoured him with her hand. This lady here died and was buried in the chapel, her effigy being sculptured in alabaster. The tomb had been wholly destroyed (doubtless by the republicans during the civil wars, when the rest of the buildings suffered so much), but her grave was opened in 1782, and the body being taken up her name and titles were found marked upon the cerecloth in which it was enclosed. The extent of the castle and its lofty towers, with the rich architecture of the hall, in various fragments, indicate the magnificence celebrated by Leland and by Fuller, who, in his quaint phraseology, calls it "of subjects' castles, the most handsome habitation, and of subjects' habitations, the strongest castle." Part of the ruins have been rebuilt as a residence.

### Parrhasius the Painter.

The correctness of Parrhasius succeeded to the genius of Zeuxis. He circumscribed his ample style, and, by subtle examination of outline, established that standard of divine and heroic form which raised him to the authority of a legislator, from whose decisions there was no appeal. He gave to the divine and heroic character in painting what Polycletus had given to the human in sculpture by his Doryphorus, a canon of proportion. Phidias had discovered in the nod of the Homeric Jupiter the characteristic of majesty—inclination of the head; this hinted to him a higher elevation of the neck behind, a bolder protrusion of the front, and the increased perpendicular of the profile. To this conception Parrhasius fixed a maximum—that point from which descends the ultimate line of celestial beauty, the angle within which moves what is inferior, beyond which what is portentous. From the head conclude to the proportions of the neck, the limbs, the extremities; from the father to the race of gods; all the sons of one, Zeus; derived from one source of tradition, Homer; formed by one artist, Phidias; on him measured and decided by Parrhasius. In

the simplicity of this principle, adhered to by the successive periods, lies the uninterrupted progress and the unattainable superiority of Grecian art. With this prerogative, evidently implies a profound as well as general knowledge of the parts, how are we to reconcile the criticism passed on the intermediate parts of his forms as inferior to their outlines? how could Winckelmann, in contradiction with his own principles, explain it by a want of anatomic knowledge? How possible to suppose that he who decided his outline with intelligence that it appeared ambient, and pronounced that it escaped the eye, should have been uninformed of its contents? Let us rather suppose that the defect ascribed to the intermediate forms of his bodies, if such a fault there was, consisted in an affectation of smoothness bordering on insipidity in something effeminately voluptuous, which absorbed the character and the idea of elastic vigour; and this Euphrates seems to have hinted at when, in comparing his own Titan with that of Parrhasius, he pronounced the Ionian's to have on roses, his own on flesh; emasculate softness was not, in opinion, the proper companion of the contour, or flowery softness of colour an adequate substitute for the sterner Titan's heroic form.

### GENERAL.

**Mr. R. D. Doulton** had the honour of being received by the King, and submitted to His Majesty a specimen of the cups which are being made to commemorate the King's death to the poor on the occasion of His Majesty's Coronation.

**The Roman Pharos** at Dover Castle is being roofed over by order of the military authorities in order to prevent further decay. It was used by early Romans as a lighthouse.

**Mr. George Cadbury** has presented the sum of 5000 to the Ruskin Memorial Fund. In making the gift Mr. Cadbury stated that he made no stipulation as to site, but gave the amount wherever this was settled upon.

**A Mansion** in the Champs-Élysées, Paris, which at the time gained notoriety as the Hôtel Paiva, has been sold at auction for 1,110,050 francs.

**Mr. G. H. M. Addison** has been elected president of the Queensland Institute of Architects.

**Mr. Inigo Pym-Jones**, of Lymington, has been recommended by the finance committee for election as surveyor of Chichester, at a salary of 200*l.* a year.

**The National Society of Fine Arts** in France received this year 2,219 pictures and designs for exhibition at the rival Salon. The selection of the architectural drawings will be entrusted to MM. Benouville, Roy, Gardelle, and Tony Selmersheim.

**A New Library** and vestries are to be built at Manchester Cathedral for the use of the choir and clergy. By the addition it will be possible to restore to the area of the cathedral the Jesus or Byrom Chapel at present screened off and used for the above purposes. The work, for which about 3,000*l.* will be required, will be a memorial of the late Sir J. W. MacLellan, M.P., who was a churchwarden of Manchester for fifteen years and was the means of raising between 30,000*l.* and 40,000*l.* for the restoration and enlargement of the cathedral.

**The Students** of the Ecole des Beaux-Arts who will compete for the Prix de Rome in the section of architecture are: (1) MM. Coutant, pupil of M. Pascal; (2) Chiffiot, pupil of M. Daumet and Esquié; (3) Faur-Dujarric, pupil of M. Pascal; (4) Ebrard, pupil of MM. Raulin and Sortais; (5) Duval, pupil of M. Pascal; (6) Hubain, pupil of M. Marcel Lambert; (7) Ferdinand, pupil of MM. Guadet and Paul Prost; (8) Prost, pupil of M. Marcel Lambert; (9) Gaüssely, pupil of M. Daumet and Esquié; (10) Perret, pupil of M. Pascal.

**The Site** for the Usher Hall, Edinburgh, has not been selected. Four sites were submitted to the committee at the last meeting, namely, the Atholl Crescent site; the Castle Terrace site, which involves the remodelling of the Synod Hall; and two sites on the city's own ground, one at the Cathedral Market in Lauriston, and the other in the Meadows. The town clerk is to procure and lay before the committee further information in printed form regarding the sites, including the cost of purchasing the Synod Hall.

**Baldersby Hall**, Yorkshire, about five miles from Ripon and six from Thirsk, and the late seat of Viscount Downe, has been partially destroyed by fire. The hall was formerly the residence of George Hudson, the railway king.

**Mr. J. T. Micklethwaite, F.S.A.**, has been engaged preparing designs for several of the copes which will be used at the Coronation. The Bishop of Durham's will cost about 170*l.*

**Ancient Lights.**—At the ordinary general meeting of the Society of Architects held on March 20 it was resolved: That it be referred to the Council of this Society to take such action as may be deemed necessary to promote some legislation to amend the existing law appertaining to rights of light. Carried unanimously.

EDITORIAL NOTICES.

of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under Workmen's Compensation Act, we have added to our **A VERY EMINENT BARRISTER**, who has made the subject a special study, and will be glad to answer the columns of this paper any questions relating to the complicated matters arising from the provisions of this new Act. Our **LEGAL ADVISER** will further answer any legal question that may be of interest to our readers. All letters must be addressed "**LEGAL ADVISER**," Office of "**The Architect**," Imperial Buildings, Ludgate Circus, London, E.C.

Editor will be glad to receive from Architects in London the results of Competitions and Tenders and other particulars of Works in progress in which they are interested.

Authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

Great disappointment is frequently expressed at the non-award of Contracts Open, Tenders, &c.; it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

**ALABAMA.**—May 1.—Designs are invited from sculptors for a memorial statue of Her late Majesty in marble or bronze. Information can be obtained at the office of the Agent for the State of Victoria, 15 Victoria Street, West.

**ALBANY.**—May 14.—Designs required for a new town hall. Premiums, 150l., 100l. and 75l. Mr. F. Bagshaw, Engineer, Harrogate.

**ALBANY.**—April 21.—Designs are invited for twenty-five houses for the Coleraine Urban District Council. 20l. Mr. W. Henry, clerk to the Council.

**ALBANY.**—April 21.—Prizes of 20l. and 10l. respectively awarded for the first and second schemes in order of merit utilising to the best advantage a plot of ground offered by the Council for the erection of about twenty-five houses in Coleraine. Mr. William Henry, clerk, Coleraine.

**ALBANY.**—April 4.—Competitive drawings are invited for a house to be erected at Langho, near Blackburn, for the

accommodation of the epileptics, imbeciles and idiots at present in the workhouses of the Chorlton Union and the township of Manchester. Premiums of 200l., 150l. and 100l. respectively will be awarded. Lithographed plan of site, and copy of conditions and instructions, may be obtained by a written application only, addressed to the Clerk to the Joint Asylum Committee, Chorlton Union Offices, All Saints, Manchester.

**LIVERPOOL.**—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

**MANCHESTER.**—April 4.—Designs are invited for a colony for epileptics and imbeciles for the Chorlton and Manchester joint asylums. Premiums of 200l., 150l. and 100l. respectively are offered. Mr. H. Woodhouse, clerk to Asylums Board, Manchester.

**MEXBOROUGH.**—May 1.—The committee of the Mexborough Montagu Hospital invite plans for the erection of an accident hospital for both sexes, for the treatment of thirty patients, with the needful nurses and servants' accommodation. Premiums of 25l. and 10l. are offered, the premium awarded to merge in the commission. Mr. C. Brumpton, secretary, Fern Villa, Mexborough, near Rotherham, Yorkshire.

**OLDHAM.**—April 8.—Competitive drawings are invited for erection of new market hall and shops in Albion Street and Henshaw Street. Premiums will be awarded to the authors of the three selected designs, viz. 50l. for the design placed first, 30l. for the design placed second, and 20l. for the design placed third. Mr. S. A. Pickering, borough surveyor, Oldham.

**SCOTLAND.**—April 30.—Designs are invited for a branch library for the Anderston district, Glasgow. Sir J. D. Marwick, town clerk, Glasgow.

**SUNDERLAND.**—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100l., 50l. and 25l. are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

**YORK.**—May 1.—Designs are invited for a Memorial to the late Queen Victoria to be placed in the Guildhall, York. The design must include a representation of Her Majesty, and be accompanied by an estimate of the cost of the work complete, such cost not to exceed 1,000l. A prize of 50l. (to merge in the commission) will be given for the accepted design. Mr. W. H. Andrews, town clerk, Guildhall, York.

CONTRACTS OPEN.

girders, joists and ironwork.

A. VAUGHAN WILLIAMS has informed us that he will  
the ruins of the Abbey de Fontibus de Merlaw to be seen  
tors during the Easter holidays. The admission fee of  
will be devoted to the restoration of the church of Little  
y. The ruins are  $\frac{3}{4}$  mile from Bourne End Station.

**BUILDING AND BUILDERS.**

OPERATIONS for the widening of London Bridge have been  
commenced, but for the present are confined to bringing  
timber to the steps on both sides of the river.

A NEW church, to be dedicated to St. John the Evangelist,  
is about to be erected for the district of Five Ways, in the  
parish of Cannock, and is to cost about 2,400*l*. The memorial-  
stone will be laid on Saturday, April 26.

A ROMAN CATHOLIC mission-room is to be erected at  
Chinley, at the cost of Messrs. Walter Scott, Middleton & Co.,  
for the benefit of the navvies employed on the widening of the  
Midland Railway between New Mills and Chinley.

A NEW Roman Catholic church is to be erected in the  
growing suburb of Acton, the dedication of which will be to  
"Our Lady of Lourdes." The building will be in the  
Romanesque style of architecture, after the fashion of those to  
be seen at Toulouse and other towns in the south of France.

THE sanction of the Local Government Board to the loan  
of 19,000*l*. applied for by the West Bromwich Town Council  
to defray the cost of extensions and improvements at the  
Borough Sewage Farm at Friar Park has been received.  
Tenders will be invited at once, and the work commenced as  
soon as possible.

A SPECIAL meeting of the Brierley Hill Urban Council has  
been held to receive a report of a sub-committee regarding a  
site for the new technical school, free library and reading-room,  
and council chamber, which have been decided upon as a  
permanent Coronation memorial. The Council unanimously  
resolved to purchase a piece of land at the corner of Bell  
Street for this purpose.

JAMES CAMERON, builder and contractor of Perth, com-  
mitted suicide by hanging himself on Saturday last. Cameron,  
who had been superintending some drainage work at Methven,  
arrived home on Friday night, but gave no indication that he  
intended to commit any rash act. On Saturday morning he  
rose early and went out. Subsequently he was discovered by  
his wife to have hanged himself in an outshed. The alarm  
was immediately raised, but life had been extinct for some  
time. Deceased was fifty-seven years of age.

MR. F. H. TULLOCH, C.E., Local Government Board  
inspector, held an inquiry at the Salford Town Hall last week  
as to the sanction of a loan by the Corporation of 23,562*l*. for  
the purposes of depôts at Agecroft, Carey Street and Wilburn  
Street, and also for the purpose of erecting refuse-destroyers

at Carey Street and Wilburn Street. Mr. W. W. Greenhalgh, assistant town clerk, said the application for the loan had been rendered necessary owing to the increase in the population of the borough and the large number of new houses erected during the last few years. The work of the scavenging department had grown to such an extent that it was necessary that these works should be carried out in order that the department might be able to cope with the task with which it had to deal. The works at Agecroft were not extensive and would involve an estimated expenditure of 2,483/. The greatest outlay would be at Carey Street, on the Broughton side of the Irwell, where it was proposed to erect, in addition to new offices, six additional destructors, with the necessary walls, also mortar mills, as Parliament had given the Corporation power to manufacture and sell this material. At Carey Street it was proposed to acquire several plots of land at a cost of 2,975/., and also to erect a river retaining-wall at an estimated expenditure of 1,100/. At Wilburn Street it was intended to erect two additional destructors. A description of the details of the proposed improvements was given by Mr. J. Corbett, borough engineer; Mr. J. Elliott, borough treasurer; Superintendent Hamblett, scavenging department; Mr. Sharpe, architect, and others, and at the close of the inquiry the inspector visited the sites.

### TRADE NOTES.

MESSRS. ANDREW HANDYSIDE & CO., LTD., of Derby, have secured the contract for 170 tons of steelwork for a destructor for the Corporation of the city of Nottingham.

A LARGE clock has just been erected in the parish church at Starston, Suffolk, which shows time on one dial and strikes the hours on the largest bell. It is fitted with all the latest improvements. The work has been carried out by Messrs. John Smith & Sons, Midland Clock Works, Derby, who are also making a large clock and chimes for St. Mary's Church, Warwick.

MESSRS. WILLIAM POTTS & SONS, clock manufacturers, Leeds and Newcastle-on-Tyne, are now making a large turret clock and chimes for Mr. Sykes Lindley, Huddersfield, and fixing a large Cambridge quarter clock at Saltburn-by-the-Sea parish church. They are also erecting a new memorial clock at Ruswarp Church, near Whitby, and a clock for a church near Pateley Bridge, Yorkshire.

MESSRS. GEORGE JENNINGS, LTD., sanitary engineers, His Majesty the King, of Lambeth Palace Road, S.E., inform that their patent electro-mechanical apparatus for indicating and recording the varying level of water in reservoirs has been adopted by H.M. War Department for the reservoirs at Tidmouth, Salisbury Plain, for the waterworks in connection with the new military camp which is at present in course of formation. The firm have also recently completed the installation of a set of instruments for His Grace the Duke of Portland, K.G., in connection with the new reservoir at the Dukeries Worksop, which is giving every satisfaction. Installation of these instruments have been carried out at some of the largest waterworks in the kingdom, notably for the Corporation of Leicester at Swithland, where the area embraced covered a considerable extent.

MESSRS. PATERSON, COOPER & CO., LTD., electrical and mechanical engineers and contractors, have opened an office at 57 Gracechurch Street, E.C., where Mr. J. Walter Brice, A.M.I.C.E., will represent them.

THE Welbeck Cottage Hospital, Worksop, is being warmed and ventilated by means of Shorlands' patent Manchester stoves and special inlet tubes, supplied by Messrs. E. H. S. Land & Brother, of Manchester.

THE seventh annual general meeting of the British Association of Waterworks Engineers will be held at Leicester on July 22, 23, 24 and 25, under the presidency of Mr. Fred Griffith, M.Inst.C.E., Corporation water engineer.

ON Tuesday last the *Brussels*, a steamer intended for the Great Eastern Railway Company's Harwich-Antwerp service, was launched at Messrs. Gourlay Brothers & Co.'s yard, Dundee. The christening ceremony was performed by Mrs. Drury, daughter of the superintendent of the Great Eastern Railway. The fittings of the steamer *Brussels* are of the modern type, and particular attention has been given to ventilation. A special feature of the sleeping accommodation is the large number of two-berthed cabins. The vessel will be lighted throughout by electricity, is a steel twin-screw steamer, 285 feet in length by 34 feet beam, fitted with separate sets of triple-compound engines, so that in case of accident to one set the steamer can proceed with the other. She is expected to be ready for the summer service.

# BRITISH MANUFACTURE

## HIGH-CLASS ENAMELS

### For all DECORATIVE WORK.

"O" QUALITY "INDIAN" QUALITY  
FOR INSIDE USE. FOR OUTSIDE USE.

The attention of ARCHITECTS, BUILDERS, DECORATORS, &c., directed to the following points in the use of these special Enamels:—

BRILLIANT GLOSS AND HARD SURFACE.

EASY FLOW AND MANIPULATION UNDER THE BRUSH.

ENORMOUS COVERING PROPERTIES.

USED SATISFACTORILY BY MOST OF THE LEADING DECORATING FIRMS IN THE KINGDOM.

Made in any Tint or Colour required, or may be Tinted with Tube Colour Stainers.

MANUFACTURED BY

ASPINALL'S ENAMEL, Ltd. New Cross, London, S.E.

## VARIETIES.

RICHARD HOLMES, town clerk of Arundel, died on the inst. from Bright's disease, aged forty-five.

BRIDLINGTON Town Council has appointed Mr. Jennings, M.B.E., sanitary inspector.

ODDINGHAM parish church was reopened after redecoration yesterday.

THE receiving homes for the St. Pancras Council, London, are about to be built in the Leighton Road, have been designed by the Local Government Board. Mr. A. E. Thompson has been appointed architect.

THE Local Government Board have sanctioned a loan of £10,000 to the Bexhill Urban District Council, in order that the Bexhill Park and pleasure grounds may be laid out and the Bexhill and Western Parade made up.

THE site of the Old Wanderers' Club at the corner of Waterloo Place and Pall Mall, has been purchased by Sir J. S. King & Co., the bankers, who will erect their new premises there. The architect is Mr. A. E. Thompson, 10, Abchurch Lane, London, E.C.

THE Viceroy of India on the 20th inst. unveiled the statue, erected by Mr. George Frampton, A.R.A., of Queen Victoria, which has been erected in Calcutta, in presence of the Lieutenant-Governor, the Commander-in-Chief, all the high officials, and a immense throng of natives.

A WORK that should be of the greatest value and interest to furniture designers and decorators is now being published by the Russian Government. It consists of a series of chromo-lithographic reproductions of drawings to scale of the chief pieces of fine furniture and objects of decorative art in the Imperial palaces, churches, &c., in Russia.

THE old Roman pharos at Dover Castle is being roofed in order of the military authorities in order to prevent further decay. This interesting relic dates back to a period before the Christian era. It was used by early Romans as a light-house. It is in a fair state of preservation considering the long time it has stood on the cliffs exposed to every kind of weather, and is regarded with the greatest interest by antiquaries all over the country.

ST. MARY'S CHURCH at Whicham, in South Cumberland, has been reopened after restoration. This church is a quaint structure, and stands at the foot of Black Combe, in the

Whicham Valley. The date of its erection is set down to the Norman period. There is a fine Norman arch over the entrance, and this lends some truth to the belief. According to tradition the church was twice burnt down by the Scots during their raids south. The two bells that hang in the belfry date back to pre-Reformation times.

A MEETING of the Glasgow Archaeological Society was held on the 20th inst. at Bath Street, the Rev. Professor Cooper in the chair. Dr. Thomas M. Bryce gave a descriptive lecture, illustrated with lantern views, on "The Sepulchral Pottery of the Stone Age in Scotland and its Affinities." The number of specimens of sepulchral pottery, he said, that could be referred to the stone age in Scotland was very limited. Until recently only four specimens were known. In the course of recent excavations he had been able to add twelve examples to the number. Dr. Bryce then described the continental affinities of this pottery with a view to determining the origin of the stone age culture in Scotland and the ethnographical relations of the primitive inhabitants of Scotland. The affinities of the pottery were with the pottery of Brittany, the Pyrenees and the Spanish Iberian Peninsula, so that the relations of the pottery gave strong support to the Iberian hypothesis as to the origin of the early inhabitants of Britain. Another paper was by Mr. George Macdonald on an ancient coin recently found at Erskine, and Mr. Graham Callander exhibited a collection of stone implements from Aberdeenshire.

A LARGE party of the members of the Edinburgh Architectural Association travelled to Glasgow on Saturday, and under the auspices and leadership of the Glasgow Architectural Association inspected a number of the more important among recently erected buildings. The programme was arranged by the President of the Glasgow Association, and among the buildings visited were the Mercantile Chambers, Bothwell Street (Messrs. James Salmon & Son, architects); Waterloo Chambers, Waterloo Street (Messrs. J. Burnett & Son, architects); Savings Bank, Ingram Street (Messrs. J. Burnett & Son, architects); School of Art, Renfrew Street (Messrs. Honeyman & Keppie, architects); Belmont Church (Mr. James Millar, architect); and Stevenson Memorial Church (Mr. John J. Stevenson, London, architect). Several private residences were also visited. At the close of the proceedings the company dined together in the Lansdowne Restaurant. Mr. Charles E. Whitelaw, president of the Glasgow Association, was in the chair, and Mr. Henry F. Kerr, president of the Edinburgh Association, was also present.

## ELECTRIC NOTES.

THE board of the Metropolitan Railway Company have let a contract for their electrical power station at Neasden to the British Westinghouse Electrical and Manufacturing Company, Ltd.

MR. E. M. HOLLINGSWORTH, deputy electrical engineer to the St. Helens Corporation, gave a demonstration last week at St. Helens of the working of a device which he has invented. In the event of an accident the breaking of a glass plate on the side of a box automatically releases the switch and cuts off the current, so that fallen wires may be handled with perfect safety.

ASTON District Council made a further advance in its scheme for the electric-lighting of the district and the electrical equipment of tramways. They held a special meeting recently, under the presidency of Councillor F. Smith, to consider the tenders for the erection of a generating station and cables for these purposes, a site for the station having been secured some time ago in Chester Street. There were no fewer than 351 tenders submitted for the work, these having previously been considered by the electrical committee. After a lengthy discussion the Council adopted the recommendation of the committee, who had devoted considerable time to the matter, and accepted tenders of various electrical firms representing in the aggregate the sum of 62,970l.

ARRANGEMENTS have been made for the holding of a service to commemorate the complete restoration of Peterborough Cathedral in July. The works have been in progress eighteen years, and have cost over 80,000l.

## THE PATENT "ACME" STONE BREAKER.

THE hardest and toughest kinds of stones are employed in construction of paved and macadamised roads, the first geological order as well as in usefulness being granite, which varies much in density and resistance to crushing force. There are the trap rocks, a group of igneous rocks allied to granite, and of which there are different varieties known as basalt, dolerite, whinstone, greywacke, &c.; but for macadam the hardest stones, such as Guernsey granite and Penmaenmawr greywacke, are considered the most suitable.

For dealing with these materials, and coping with the very heaviest work that a machine of the kind is called upon to do, the patent "Acme" stone breaker has been designed, both in the stationary and portable form, so as to meet the various requirements. For excellence of work, the quantity of material dealt with, simplicity of construction, and the consequent small expense entailed in renewal of working and wearing parts, it is claimed, and with a good show of reason, that there is nothing in the market to equal the apparatus in question.

The patent "Acme" portable stone breaker, adapted for road-making and maintenance, as well as for general corporation and estate work, is specially designed and constructed with extra large "wheel base" to give the greatest possible steadiness when at work. The output by this machine is, to understand, very great, and the sample of stone produced thereby is pronounced by experts to be equal in all respects to hand-broken, while it is able to deal in a satisfactory manner with materials, on which account it is, especially useful, as when required for roadwork it can be easily transported, if needed for the crushing of clinker and ashes at the refuse-destroying works, while it is fitted with all up-to-date labour-saving appliances.

This machine, which we illustrate, is fitted with the new patent portable tilting screen and platform, which has been designed to obviate the difficulties in moving from one place to another experienced with all other portable stone breakers. The revolving screen for sorting the broken material is here shown tilted. By this arrangement it is saved from damage by being dragged along the ground when the wheels sink a few inches in soft roads, lessens the space occupied in storage, and facilitates the turning of corners in narrow roadways. Messrs. Goodwin, Barsby & Co., St. Margaret's Ironworks

shows the heat concentrated under the waste heat passing under the hot plate.

This Independent Range is fitted with hot water circulating boiler, as shown in the sections, and the heat of the fire passes direct under the bottom of the oven.

A Fire Brick Dome and damper is fitted over the fire, which enables the heat to be concentrated at pleasure on the hot plate or boiler, the waste heat of either passing under the other, thereby utilising what is usually lost.

The above shows the heat of the fire concentrated on the hot plate and the waste heat passing under the boiler.

ing and oven door are lined with slag wool and a third oven can be arranged if required.

## NATIONAL REGISTRATION OF PLUMBERS.

THE twelfth annual general meeting of plumbers registered by the Manchester and District Council for the Registration of Plumbers was held on Saturday afternoon in the chemical lecture theatre, the Technical School, Whitworth Street, Manchester. Mr. W. H. Munro, chairman of the Council, presided, and there was a large attendance. The report of the year's work was read by the secretary (Mr. John W. Hirst), and was of a very satisfactory character. It was stated that 688 applications for admission to the register had been received—191 from masters and 497 from operatives. After careful consideration, 161 masters and 434 operatives had been admitted, and 30 masters and 63 operatives referred to the examiners. The statement of accounts showed that the receipts (including a balance from last year's account of 116*l.*) amounted to 697*l.* 9*s.* 11*d.*, and that the expenditure left a balance of 236*l.* The meeting elected the Council and the auditors for the ensuing year, and cordially thanked the technical instruction committee and Mr. J. H. Reynolds for the use of the meeting-room and the chairman and the secretary for their services during the year. At a tea, later in the afternoon, Mr. W. H. Munro was presented with an illuminated address by his colleagues on the Registration Council.

THE question of wages and hours in the Coventry building trade still awaits a settlement. A communication was sent some days ago by the Federated Building Trades' Association, in which they refused to discuss any of the proposed alterations unless the employers withdrew several of what they termed the "objectionable clauses." A good deal of reticence is shown by those concerned in this matter, but we believe that the objectionable clauses relate to the paying of all men the same wages, interference with the authority of employers in the conduct of their business and the hours worked during the short days of the winter months. The notices served by the masters expire on Monday next.

## LIGHTING AND HEATING OF THEATRES.

THE theatres and music halls committee of the London County Council report:—"It will be within the recollection of the Council that the revised regulations which were approved on July 30, 1901, do not contain any clauses in regard to the electric lighting and heating arrangements at places of public entertainment. We were not quite prepared at that time with regulations respecting these matters, but after the summer recess we resumed our consideration of the subject, and as soon as we had prepared regulations we, at the request of the London Entertainments Protection Association, submitted them to that body for their consideration and suggestion. An electrical expert was appointed by the Association to confer with the Council's engineer, and as the result some slight modifications of the regulations were proposed to us which we are pleased to state we were able to accept almost in its entirety. The regulations have been amended and are now in accordance with the views of the London Entertainments Protection Association, and we have given instructions for copy to be sent to every member of the Council. We recommend that the regulations now submitted in regard to the electric lighting and heating arrangements at theatres, houses, rooms and other places of public resort within the administrative county of London be approved, and that the seal of the Council be affixed to two copies."

## READING BUILDING TRADES MASTERS' ASSOCIATION.

THE third annual dinner of the Reading and District Building Trades Masters' Association was held at the Queen's Hotel, Reading, on the 17th inst. Mr. J. T. Bottrill presided.

The Chairman proposed the loyal toast, which was duly honoured.

Mr. H. A. Lewis submitted "The Architects and Surveyors." With regard to the municipal buildings scheme, he deprecated the giving of the commission of 100 guineas to an outside

itect, as he believed they had architects in Reading who e equally capable of developing the scheme. This had a recently proved by the fact that a young man, Mr. J. H. dman, had won a competition at Trowbridge open to the le of England for a building (isolation hospital) of con- rable size.

Mr. W. R. Howell, responding, congratulated Mr. Goodman his success, and expressed pleasure at the good feeling ing in Reading amongst the architects and their fellow i in the craft. During his short experience in the town he seen very great developments, not only in the quality of architecture, but also in the quality of the building. When history of Reading at the beginning of this century was ten the verdict, on the whole, would be a favourable one, but e or two instances, he thought, they would be blamed. as not for him to apportion the blame to anyone, but fifty rs hence people would wonder what the people of Reading e doing when they allowed the improvement of Queen oria Street to be carried out in such a splendid way, yet i the fatal blot of being too narrow. Another matter that e historians would blame the present age about was the question of overcrowding. One had only to walk along Tilehurst Road and look down upon the sea of houses on the i Park estate. Many people blamed that wicked man "the ulative builder" for the overcrowding, but he (Mr. Howell) ld blame the system under which they lived. The chief cause the want of locomotion and privacy. Within the next fifty rs they would get vastly improved means of locomotion, ch would allow "the speculative builder" to erect houses away from the centre of the town. He also thought that the f means of locomotion would take the form of motor-cars er than trams. One of the pressing duties of the people Reading to-day was to urge the Town Council to extend r boundaries. They were much hemmed in, especially on north and west. On the south there was plenty of ground, there were reasons which made it not easy to build there e present time. With regard to the 100 guineas scheme for municipal buildings, many people thought the architects of ding had been hardly dealt with, but seeing that many of n got more than half their practice outside the town they d not complain about an outsider coming to work here. logical conclusion to the argument was that if they objected outsiders the architects of Reading would have to confine work to the town. As much as he would like to have the our of carrying out the extension of the municipal buildings,

he would not care to do so because it would mean the giving up of his private practice.

Mr. J. Catley gave "The Town and Trade of Reading." In an interesting speech, dealing with some of the historical features of the town, he said during the thirty years he had been in Reading he had seen marvellous changes, but in the next thirty years there would be far more changes to marvel at. When the Domesday Book was written there were twenty-eight houses in Reading belonging to the King and twenty-nine in ruins. The progress of the town had not been at all smooth; it had been one long conflict between men on either side against despotism and inertness. What every town needed for progress and prosperity was good municipal government, and they were thankful for the many men on the Town Council who devoted their time and energy in the service of the town. Just now municipal government in Reading had reached something like a crisis. There was the question of education—elementary, secondary, or collegiate—which a wise community ought to foster and forward, and which paid quite as well as waterworks or tramways. Then there were slums in Reading that were a disgrace to the town. Sanitary science was not yet applied in Reading as it should be. They were thankful for a lessened death rate, but much remained to be done. There was the question of the isolation hospital, by which the community might have the chance to have that greatest of blessings—health, and also the question of the lighting of the town, which should be under public control. Then there was the question of how the communities springing up outside the borough should march side by side with them in efficient and wise administration, so as to be prevented from making those mistakes common to any community, and which were costly to set right. On their Town Council they had statesmen, and they were proud of such a speech as that recently made by one of the Councillors—full as it was of wisdom and insight. In all these matters to which he had alluded they were, as builders, willing to lend a hand and to bear their share of the financial burden; but there were a few things they wanted to say for themselves. They wanted to tell the Town Council to make their contracts fair and equitable, and see that they were carried out. They wanted to foster private enterprise as much as possible in Reading. They did not want any more restrictions than they could help, but to let local talent have the opportunity of developing and showing itself, because the success of townsmen was the success of the town.

Mr. Barnard Messer replied to the toast. Referring to the scheme of the municipal buildings and Reading College, he expressed the opinion that the college had a great future, and would have a very great influence upon the town and trade of the town. He hoped in the carrying out of the municipal buildings scheme that the work would be in the hands of the Reading architects and builders. Viewing the marvellous strides made by Reading during the past thirty years, they might certainly say that they were citizens of no mean city. With Mr. Howell, he foresaw the time when Reading would stretch much beyond its present limits, though he did not agree with him in his remarks that the speculative builder should erect houses outside the town, because they would never know when they would be occupied. Neither did he agree that motor-cars would be the means of transit in the future. There was far more likelihood of tramways being the means of locomotion, and the Reading Corporation were farseeing in that respect in adopting the electric system, which would undoubtedly be the most popular means. He also expressed the opinion that the future would see great developments in Reading, with the use of the Thames waterway, improved buildings and the removal of the slums. In fact, he thought the town would so far advance that it would become the metropolis of the South Midlands. In conclusion Mr. Messer advocated the formation of a Chamber of Commerce for Reading.

The Mayor proposed the toast of the evening, "The Association." He apologised for not being able to be present earlier, explaining that he was obliged to be at the town's meeting to consider the Coronation celebration. From the report of the Association he gathered that they were banded together to protect their own interests, and also the interests of their customers and the welfare of the men they employed. The more employers combined the better it was for those whom they employed; in fact, it was better for both sides to be combined, with proper organisation, so that they could meet each other and discuss any questions of difference that might arise. He believed they had established a Conciliatory Board, so that before any strike took place in connection with the building trade they could jointly discuss the matter before the men took any definite action. He wished the Association every success and prosperity.

Mr. G. S. Lewis responded.

The Chairman proposed "The Visitors," for whom Mr. Williams responded. The concluding toast was "The Press."

## ARTISTIC ELECTRIC ILLUMINATIONS.\*

(Concluded from last week.)

THE route I took was from the Langham Hotel, Portland Place, down Regent Street to Piccadilly Circus, along Piccadilly to Bond Street, up Bond Street to Oxford Street, along Oxford Street to the Marble Arch, and down Park Lane and Grosvenor Place to Victoria Street. Then, passing Westminster Abbey, I went up Whitehall, the home of the great public offices, along Pall Mall, finishing with St. James's Street. The Langham Hotel had nothing to show.

The Queen's Hall was similarly a mass of darkness.

The Polytechnic was a void, and looking up and down Mortimer Street I saw nothing. The first star I saw was over Messrs Wyon's (No. 287), and that was an ordinary small gas star. Messrs. Lobb (No. 296) had a simple E.R. Nos. 297 and 280 had a plain line of lights. This was all the illumination I found north of Regent Circus.

The actual Regent Circus was in darkness, but Messrs Jays had a very big, ugly, although very ambitious, gas-jet display facing Regent Street. It was supposed to be emblematical, but as the lights were being constantly blown out the whole appearance of this device was most restless.

Opposite Messrs. Verrey's there was an E.R.

Messrs. Swears & Wells had an exceedingly vulgar kind of whirling crystal display with balls and stars moving automatically. I assume this was supposed to be something novel, but its taste was execrable.

Messrs. Lewis & Allenby had a badge; Messrs. Brooks and Messrs. Vickery likewise sported badges.

At No. 146 Messrs. Rowlands & Fraser sported a gas star and an E.R., whilst Messrs. Carrington, No. 130, were satisfied with a badge.

The device of Messrs. Scott Adie was the first of any artistic pretensions. This comprised a large thistle design worked out in crystals backed by gas-jets, and in colouring and effect it was certainly as good as anything could be in this crystal work.

The Goldsmiths' Company had a tiny little electrical badge or frame surrounding the King's head, rather pretty in itself, but insignificant. The main merit of this badge lay in the fact that it was the first electrical device I had come across all the way.

147 STRAND, LONDON, W.C. (FIRST FLOOR)

Regent Street, and hence aspired towards some degree of novelty. Messrs. Johnson, the hatters, sported a badge and, I believe, the gas stars. The new Imperial Restaurant, which has just been fitted up, with a couple of very common badges and a crown, looking remarkably crude against the elaborate picture which they had recently erected. Now come to Piccadilly Circus. The Criterion sported some gas-flares on the roof, and the front of Messrs. Swan & Edgar could only boast of a badge, whilst looking down Lower Regent Street as far as could see, I found that Messrs. Elkington was the only one with an attempt at display, and they only had a badge. Turning down Piccadilly and going westwards I found myself in front of Messrs. Grant (No. 23), Dobbie (No. 198), Coist (No. 36), Sotheran & Co. (No. 37), and Lincoln, Nett & Co. (No. 49), the badge of the last named being a more ambitious than the others. Messrs. Woodrow (No. 46) had an E.R.; Messrs. Hatchard (No. 187) a star. At the corner of Bond Street and Piccadilly, Messrs. Scott, hatters, had a badge in gas and some small lamps over their shop-front. Turning northwards up Bond Street I saw that Messrs. Neubaum & Sons (No. 45) and Messrs. Stewart & Co. (No. 46) had badges; Messrs. Hill (Nos. 3 and 4) a gas star; Messrs. Hummel (No. 6) an E.R., and Messrs. Mitchell's display were rather more ambitious, for they had a motto "God Save the King," a star and a line of lights over their shop-front in gas. At No. 20 Messrs. Clark had an E.R. and a badge. Messrs. Barker (No. 5 New Bond Street) had a semicircular display in gas lamps, Messrs. Henry Lewis & Co. (No. 172) a star, Messrs. Morris & Co (No. 22) a badge, whilst Messrs. Callaghan & Co. (No. 23) had outlined their shop-front, provided an E. and R. and also four stars, the whole making a very creditable display in gaslight. Messrs. Cadbury, Pitt & Co. (No. 24) had a badge, with some thistles in primary gaslights. At No. 151 there was a badge, and Messrs. Grove & Co. (No. 150) had a star. Messrs. Savory & Moore (No. 143) had an outline over their shop fascia with a sun in the centre and a crown above it, and E.R. on each side; while Messrs. Johnson, the hatters, had a slight outline and a star.

This was the total of the Bond Street display, that home of the warrant-holders. Oxford Street to Marble Arch was pitiable, such great establishments as that of Messrs. Marshall & Snellgrove, with a splendid front, simply appearing as a mass of darkness. Messrs. Squire alone had a creditable display, a novel one, namely, a large electrical badge, E.R.I., very cleverly designed and of high artistic merit for this kind of work; the badge was a great deal larger than those usually found, the colour scheme good and the whole in proportion to the building. Nos. 425 and 456 were the only others I noticed with lights, and those were gaslights. No. 465 had, I believe, an electrical E.R., but of this I am not quite sure. All the way down Park Lane was a mass of darkness, and I hear that South Audley Street and Mount Street were practically the same. The first creditable display in this part of the West End as far as private houses are concerned was Apsley House, the Duke of Wellington's, which had a large motto in gas, "God Save the King." Grosvenor Place was a mass of darkness; also the property all round Victoria Station, and Victoria Street, the home of so many colonial offices, only had a few E.R.'s and a crown. The only big display in Victoria Street was that of the Electric-Lighting Boards Company along the front of Grosvenor Mansions, where the balconies were very carefully outlined in garland fashion and some very large E.R.'s, crowns and stars had been grouped on the façade, the colouring being in good taste. At the end of Victoria Street comes the Square which so incongruously has Westminster Abbey on one side and the Aquarium on the other. The Aquarium had some tawdry outline work and some E.R.'s in gas, plain and vulgar. Whitehall had scarcely anything, although the Admiralty had gone to the length of a gas crown and an E.R. in leaves in the shape of old-fashioned gas-jets. The entire Government Offices were otherwise in a mass of darkness. Arriving at Trafalgar Square, I looked down Northumberland Avenue, and found that the only effective design was that of the Constitutional Club, which had the words "For King and Constitution" and an E.R. on each side, and a neat club badge. The Hôtel Victoria had a primitive attempt in white wood stars with single incandescent lights hanging along the front, looking more like the endeavours of a fifth-rate music-hall than those of a first-class hotel. The Métropole actually had a few flares on the roof. The Avenue Theatre also had a few flares.

**VOLUME LXVI. OF THE ARCHITECT.**  
Handsomely bound in Cloth, Gilt Lettered, price 12s. 6d.  
Office: Imperial Buildings, Ludgate Circus, E.C.

Trafalgar Square was practically without any illuminations; but, going up Cockspur Street, I found that one of the shipping companies at No. 16 had a charming ship-badger with a crown above it in crystal with the picture of a ship in the middle, exceedingly well and tastefully done, one of the few attempts at really artistic work.

Pall Mall East had a few R's and stars in gas.

The whole Carlton Hotel block only showed a crystal badge. This badge was in better colour than those generally made, but was rather poor for so large a block.

No. 7 Pall Mall, the headquarters of the Electric-Lighting Boards, had outlined its windows with electric lights and had a large crown at the top of a semicircular window and the words "Edward the VII."

I then reached the heart of Pall Mall Club-land; but I am sorry to say that I could find nothing novel here, for the whole of Pall Mall had practically nothing else but the usual gas-flares. Here I should perhaps add that gas-flares themselves, if placed at regular intervals along an entire thoroughfare, are exceedingly effective and dignified, but to find them only here and there on an otherwise black street has a depressing effect, and savours rather of the special illuminations of an asphaltting or road-making company when they do night-work with the assistance of naphtha lights.

The final stretch I took was up St. James's Street. Here the Thatched House Club had flares, Nos. 73 and 8 had stars, and a few of the clubs had badges. Chubbs had made some attempt at gas display—an E.R. flanked by two circles centred by a crown.

The Royal Society Club had some flares, Briggs a couple of stars, Boodle's Club an E.R. and a star, and Brooks's an E.R. and a crown.

The New University Club had some flares, Hooper's a badge, and Thomas's a small outline.

Devonshire Club and White's sported a badge and star respectively.

Fortunately, the finale of my round was a pleasant one, for I found that Messrs. Heath, the hatters, had a charming electrical Union Jack, which, I understand, had been specially made up by their own workmen, and which was placed over the corner entrance. This flare, which, I believe, really hails from America, in design was a thoroughly artistic and well-made device of great effect, and was certainly the best individual device on the whole route.

The second item with which I closed my round was Devon-

shire House, which had its walls outlined with gas, and had some E.R.'s and a crown; but I may tell you that, speaking generally, I went home very depressed as to the taste displayed on the King's first birthday celebration.

Now from all this you will see, with what I have already indicated above, that, as far as gas illuminations are concerned, the plain outlining or the plain star are all that I can recommend.

As far as the crystal device is concerned, the plain badges are by far the most effective, such badges as that in front of the P. and O. office in Cockspur Street, or some of the plain badges with the Imperial Crown above, being far above anything in the more elaborated designs. The moment any tawdry attempts are made at whirligigs or the like, or the outlining of heraldic devices, nothing but failure results.

Now, when moving down these thoroughfares the one thing that, of course, struck me most was the absence of electric-lighting appliances. In all, electricity had only been used at points, *i.e.* at the Goldsmiths' Company, at Squire's, in Victoria Street, and at No. 7 Pall Mall, the offices of the Electric-Lighting Boards.

Well, gentlemen, this really was something very meagre, and on looking into the question I found the following, namely, firstly, that Londoners are too conservative to leave gas for electric light easily; secondly, that the electric power companies in London do not seem to quite have grasped the possibilities by which they could make money, and by which they could induce their customers to regularly illuminate by electric light instead of gas. The public certainly considered the few electrical devices it saw as superior to what was being done in gas or oil lamps, that is to say, the public expressed itself so frequently. As far as the Victoria Street decorative scheme in particular was concerned, the only large electrical scheme I saw certainly created quite a mild sensation.

We must, of course, remember that the illuminations on the King's birthday were trivial in the extreme compared with any illuminations one would find in connection with a similar event in any foreign country, or, as a matter of fact, in our own colonies, where electric light has already been used with great effect. We must also not forget that the Scotsman is already ahead of us, for the main buildings of the Glasgow Exhibition were outlined last summer in the best possible style.

The great difficulty, however, in outlining buildings with electricity in places like London, where labour is dear, has

one of cost. Then the time taken in fixing and the necessity, as a rule, of keeping to straight-line work form are main drawbacks.

Now, with the impending invasion of the E.L.B. system brought forward by the Electric-Lighting Boards Company, the question of expense, the question of time of fixing and the question of keeping to straight lines have been overcome, and, what is far more important, those getting out their decorative schemes are not bound to give points in fixing their lights, but can fix them wherever they like at will and without difficulty. Thus, given a straight line of cornice, it may suit the designer to space his lights 2 feet apart, but, on seeing the effect on rehearsal night, he considers the lights too close together. He thereupon simply removes his lights and fixes them in 2 feet 6 inches apart. This meets any system of wiring lampholders tied to given points. Similarly, he may wish to have a straight line; he may simply wish to festoon his work, twine his cables round columns. This he is quite at liberty to do, for he can simply unroll his flexible cable off its drum, twine it round anything he likes, festoon, garland and work in his lamps wherever he chooses, moving them, if the effect does not please him, until he gets right proportions, right distances, &c., and can give full play to his imagination.

The great difficulty of artistic illumination has always been the design. All this can now be avoided.

Again, given an electric-lighting board, the proud possessor can change his motto, his device, his sentiments at will, by changing his letters and pricking them in wherever he likes. An ardent Liberal who has said "Bravo, C. B.," one night, can change to "Bravo, Rosebery," on the next, if he so wishes, without extra cost.

What can be done in the way of artistic illumination with the assistance of these appliances may be seen from the experience gained in France, the most artistic-loving country in the world. There we find that when the Czar arrived at Compiègne the public authorities wished to do something for him extraordinarily well and show him something novel, they immediately got hold of these new appliances, and decorated no less than two miles of streets with them in a festoon pattern. In an art-loving country like France immediately takes up

an invention only a few months' old and applies it with high artistic merit, there must be something in it.

What happened at Dunkerque and Compiègne last summer at the time of the Czar's visit has been repeated again and again in that light-loving country, one of the principal demonstrations of late being at the Hôtel de Ville of Ste Etienne early in January. But more recently, the great Victor Hugo celebrations, when a mass of illuminations on the same artistic principles were utilised, showed what could be done.

Mr. Sachs thereupon, with the aid of illustrations, went on to describe the various decorative schemes that lent themselves particularly to electric lighting, and dealt at some length with the various illumination schemes on the Continent, at Toronto and Montreal in connection with the visit of the Prince and Princess of Wales last autumn.

Mr. Sachs then went on to show the easy application of the Electric-Lighting Board's specialty for artistic illumination schemes, and demonstrated the easy adaptability of the system for rapid temporary work.

For the purpose of demonstrating the application of the Electric-Lighting Board's system, a number of valuable and highly artistic designs prepared by Mr. Haité, president of the Society of Designers, were shown, several of them having been worked out in materials by Mrs. Hart.

Mr. Sachs closed his lecture by referring to the possibilities of uniform decorative schemes for districts like the City of London, St. James's Street, Pall Mall and Whitehall.

### FOUNDATIONS ON QUICKSAND.\*

MERIDEN lies in a valley between high hills. In the valley, which is claimed by some to be the original bed of the Connecticut River, is a soil which consists of a sandy loam, a

**"TAYLOR'S PATENT JUNCTION"**

No. 12662.

For WATER CLOSETS, WATER PIPES, ANTI-SYPHON PIPES, &c.

APPROVED BY ALL SANITARY AUTHORITIES.

A junction has been invented with a view to enable anyone fixing closets overcoming the difficulty of the angles required for the various makes, also to avoid the necessity of having joints inside the walls, which are not allowed by County Councils, Borough Engineers, Architects, &c. The 4 inch Junction can be made to any size from 4 inch downwards. Any plumber will see at a glance the great convenience of this, as it only requires one junction for the many shapes and sizes. No Brass Thimbles or Calking required. Gas and Watertight Joint can be made in a few minutes by any ordinary Plumber. In fixing this Joint, it is necessary to cut the Lead Pipe to the required angle, place on the loose Iron Flange, then flange back the pipe 2 inch all round, coat the face of Flange with a little Red Lead Putty, bring the two faces together and up with the Bolts, screwing up each Bolt a little at a time until they are all tight, then the Joint is made and any test. Another great convenience is:—In case of any alterations or renewal of Soil Pipes, all required where this Junction is used is to unbolt the same, and the Closet and Pipe leading to it are left with all other Junctions it is necessary to take down the W.C., break open the wall, damaging the Property causing other inconvenience.

Is the front view of Junction and loose flange; the inlet being elongated, allows the lead pipe to be cut to any required angle.

Shows the Joint fixed and ready for tightening up, and also a few of the angles which can be got.

Shows the one size which can be adapted for 4 in. Soil Pipe, and a 4 in. x 1 1/2 in. Invert Junction for Anti-siphon Pipes, &c.

Shows how to arrange for a small sized branch.

In Three Strengths—Ordinary Bain Water, 1/2 and 3/4 Metal.

DES AND PARTICULARS CAN BE HAD AT ALL WHOLESALE MERCHANTS, OR FROM

W. TAYLOR, R.P., Sanitary Engineer, ECCLES, MANCHESTER.

little gravel and plenty of quicksand. Most of the buildings in this valley rest on the skin which is found at various depths below the surface, and here the Meriden Gas Light Company bought a 300 by 500-foot meadow lot adjoining its works on which to erect a new holder. Careful borings were made over a section 120 feet wide by 250 feet long to determine the thickness of the gravel, if any, and its distance below the surface. To the west of this section, and 25 feet distant, runs a shallow brook, 20 to 30 feet wide—shallow except in freshet time. About seventy-five tests were taken, and the result laid out and plotted into curves, so that the most desirable place for the site might be located. The top material was a sandy loam, evidently a silt deposited from the overflow of the brook when in past years it was not so confined; the next a good gravel, but very thin; below that a quicksand of unknown depth. At a few points the gravel was found as near as 2 feet from the surface and 2 feet thick, while at the others it was 8.5 deep and only 0.4 thick, shading off to nothing. The average depth, however, taken from the boring stations, was 5.5 feet deep and 1.2 feet thick. A boring of 50 feet taken in the centre of the site showed 42 feet of quicksand and still more below.

On such materials it was decided to construct the foundation and erect a steel tank holder, to be 115 feet in diameter and 103 feet high, holding 700,000 feet of gas in three lifts. The weight of the holder to be 475 tons and the weight of the water to be 8,625 tons, or a total of 9,100 tons.

As the work of excavating progressed and the gravel was exposed, there was found a clearly defined depression diagonally across the pit, as if at some time the brook had flowed that way; for logs and trunks of trees were found together with a quantity of brush. Through this depression the gravel was very thin, and in three places the quicksand was entirely exposed—the first, a space 10 by 15 feet; the second, a space 4 by 12 feet; the third, a space 3 by 15 feet.

Hardly had the whole of the loam been removed when a rain came, followed by a heavy freshet, overflowing the meadow and deluging the pit. When the water had subsided it was pumped out in 8 hours with a 4-inch centrifugal pump and a 7½ horse-power motor, though the water was 10 feet deep in some places. The freshet convinced the company more than ever that in erecting a holder it would be advisable to make the top of the foundation above high-water mark, which in this case would mean a fill in some spots of 12 feet, with an average of 8 feet, and the steel tank would be 2.5 feet above the level of the meadow.

At this point a difficult problem was confronted. Meriden topographically is on high hills and in a sandy valley; good gravel is a very scarce article. Four miles away, on the line of the railroad, is a large, poor gravel bank, and two miles in another direction is a small, good bank; but with all the teams that could be procured it was not possible to haul the material as fast as it was needed; and it was expensive—1 dol. per yard—delivered. It was evident that other and good material must be obtained in large quantities. On the line of the railroad three miles away is a large trap-rock quarry. Refusing the shape of iron-stone, soft rock and some dirt is accumulated in large quantities. It was believed this stone would mix well with the material which was on hand and could be purchased after it had been passed through the crusher to a 1½-inch size at 60 cents per yard delivered, and in quantities up to 150 yards per day. About 50 yards of gravel and 50 yards of clean sharp sand could also be procured each day, and as much as needed from the works as there were teams to put on it.

The question of piling was considered, and by some might seem the only wise plan under the circumstances, but after consulting the leading local builder who had worked on this quicksand for thirty years and had erected some very heavy factory buildings on it, it was thought best to put in a combination filling of the above-named materials.

The quicksand is found hard packed and not easily dug unless water is allowed to mix freely with it. Although the excavation was in places much below the level of the brook little water was encountered, and quite as much came from the land as from the brook side. By keeping the bare spots well drained the men could work on the quicksand with a degree of ease without sinking in very deep; the less it was disturbed however, the better off they were. Over these bare spots it was decided to lay plank close together lengthways of the holes and upon these 8 by 10-inch timbers, 8 inches apart, crossways of the holes. The filling between the timbers was of pieces of bricks and old retorts broken up fine, that being the best material at hand just then. One of the bare spots being narrow and long, the surface was covered with large flat stones, the smaller spaces being filled in with fire-bricks and coarse ashes.

While working at this low level a pump was run night and day; also from these quicksand spots a 4-inch tile drain was laid to a central point to facilitate drainage and keep the mass from becoming spongy while the tamping was going on at each course of filling was laid.

Until the whole surface approached a level no roller could

Specially and scientifically designed to prevent and mitigate the evils of Smoky Chimneys.

SANITARY PIPES.

GLAZED BRICKS.

was used, but everything put in was thoroughly rammed and sprinkled. The layers were about 3 inches thick over the whole surface. When the valleys were evened up a two-horse roller was put on, and as the thickness became greater this roller was increased in weight to 6,500 lbs., requiring four horses. When the level of filling had been raised above the natural water level the pumping was dispensed with over night, allowing the foundation to be saturated, but it was pumped out again in the morning.

Near the centre of the foundation a loose brick well was built up, into which the water ran as the foundation was successively wetted, and from which it was pumped to the brook. There were some high knolls of gravel not over 3 feet under the surface. It was thought at first that the 5-foot concrete side wall foundation might rest on these, but further consideration convinced the company that this was not advisable, as part of the foundation would rest on natural gravel, while most of it would be on filled ground, so the whole level was raised 1 foot to allow of the same kind of cushion underneath the whole structure before the 5-foot circle was started.

The layers spread each day over a diameter of 125 feet were about as follows:—125 yards of quarry refuse, 40 yards of good gravel, 50 yards of works' ashes. Towards the end of the work the ashes were exhausted. Near by was a bank of 100 yards of sand, and from this was taken what was needed to make the top dressing under the concrete, spreading on the tone, washing it in and carefully rolling. Toward the end the roller worked night and day.

Near the edge where the wall of concrete was laid, there was a space that could not be rolled, but had to be filled and tamped to a depth of 4 feet. In order to make sure that this portion was as solid as the centre, a round tapering bar 5 feet long was driven into the main foundation several times. Seventy blows on the average were required to drive it 4½ feet, and the outside ring was tamped until it equalled the above test.

The amount of material removed approximated 2,900 yards. The work of excavating and filling ready to begin concreting took twenty-two days, and six days more were required to fill in around the great circle after the concrete wall was 4 feet high. This, however, did not delay the concreters in their work. The filling was as per the following amounts:—Quarry stone or freuse, 1,780 yards; gravel, 680 yards; sand, 310 yards; ashes, 1,100 yards; total, 3,870 yards.

On this foundation was laid 630 yards of Portland cement concrete, in the following proportions:—1 of cement, 2½ of sand and 5 of stone. The size of stone was 1½ inch and smaller. A great circle of concrete 4 feet wide and 1 foot thick was laid 5 feet below the finished top. On this circle was laid a ring 3 feet wide at the bottom, tapering to 2 feet 9 inches wide at the top, and 3 feet high; resting on the ring was laid, over the whole diameter of 118 feet, a layer 1 foot thick, trued to perfect level and plastered smooth. This work was accomplished in eighteen days, and in a most satisfactory manner, a local engineer taking the job at 4.90 dols. per cubic yard laid. As soon as the foundation was ready the iron men were on the ground, and the holder was erected complete in a week less than the specified time of four months.

In order to prevent the action of the brook eating away the bank near the holder, a stone wall 7 feet high was built to the level of the holder foundation and 400 feet long, protecting also a new purifier building near the brook. City water was used to fill the tank, as the brook water contained acids. It took three and a half days to fill the tank, which holds a little over 2,000,000 gallons. Before the water was put in careful levels were taken on eight points of the foundations. After filling levels were again taken, and there was not the slightest settlement.

### A STEEL PRISON.

THE new part of the Tombs prison, New York, has a 52 by 184-foot wing 132 feet high, with heavy masonry walls and steel framework, which contains 320 cells for male prisoners. The wing has semicircular ends and a street entrance in the centre of one long side, opposite which is a transverse passage to an auxiliary building containing kitchen, laundry, dining-rooms, chapels and other apartments. In the cell wing the basement is devoted to the mechanical plant and storage, the first storey to general offices and apartments for the employes, the second and third storeys to cells, and the fourth storey to an airing court, which comprises all the floor space except a small portion in the centre, and is used for an exercising place for prisoners, the high attic being unoccupied.

The steel floor-beams, says the *Engineering Record*, are supported directly by the exterior walls and by a centre longitudinal row of steel columns about 13 feet apart on centres.

6 HOLYWELL ROW, FINSBURY,  
LONDON, E.C.

NEW CATALOGUE FREE ON APPLICATION.

Both the second and third storeys are 35 feet high in the clear, and each contains four tiers of forty cells each, arranged in two parallel longitudinal rows, 5 feet apart in the clear, as indicated in the general cross-section. The cells have grated doors and transoms, and are warmed by hot air delivered through ducts in the outer walls to the main corridors, and ventilated by ducts having registers in the rear cell walls and exhausted above the roof by electric fans. The space between the rows of cells is called the utility corridor, and in it are located all plumbing pipes and vent flues, and there is a grated platform covered with rubber matting at each floor from which the guards can inspect the cells through peep-holes, and from which the pipes are accessible. The ends of these corridors are closed with locked grated doors and with solid steel-plate doors, so that no circulation of air can take place between them and the main cell-rooms.

There is a 10-foot corridor between the cell-fronts and the outer walls, and the tiers of cells are symmetrically arranged with the transverse and longitudinal axes of the wing, which divide them into four sets of ten cells in each tier. In each tier the two sets of ten cells each on the same side of the transverse axis of the wing make one group, which has at the outer end a shower-bath cell, with its outer wall curved to correspond with the end wall of the building; between them is the entrance to the utility corridor. In each storey the three upper tiers of cells are accessible from stairways in the centre transverse corridor, and are surrounded on both sides, and the rounded end by U-shaped balconies 3 feet wide enclosed by steel gratings.

Each cell is about 8 feet long, 6 feet wide and 8 feet high, resembling one compartment in a set of steel pigeon-holes. The floors, ceilings, walls and partitions of the cells are made with burglar-proof flat steel plates and angles, countersunk rivetted together and supported on the steel floorbeams of the building. The 2 by 2½-inch vertical angles in the corners of the cells are ⅜-inch thick at the lower tier, and reduce by ⅛ to ⅜-inch at the upper tier. They are continuous through the four tiers in each storey, and have planed, ribbed cast-iron shoes seated on the floorbeams. All the sides of the cells are made of vertical steel plates extending down below the floor line to rivet to the corresponding plates in the cells of the tier below. The fronts of the cells are made of ⅜-inch smooth plates, rivetted at the top and bottom joints to inside 2 by 2 by ¼-inch horizontal flange angles, which are rivetted together through their outstanding flanges and form T's carry-

ing the cell floors. The cell walls next the utility corridor are similar, but ⅝-inch thick, made for each cell with two plates rivetted together, with planed edges and a vertical butt joint covered by double 4 by ⅝-inch splice plates. The floor and ceiling of each cell is made, like the utility corridor wall, of two steel-plates with planed edges, butt joint and covered splice, but in this case the plates are ⅝-inch thick.

The same plates serve for the floor of one cell and the ceiling of the cell next below, and are rivetted to the 2 by 2 by ¼-inch angles at the joints of the wall-plates. In the upper tiers of cells in each storey the two ceiling-plates are spliced together with an inside batten-plate and an outside 4½ by 2½ inch T-bar. The floor-plates of the first and fifth tiers are spliced with an outside T-bar and an inside batten-plate, and are well bedded in concrete. The floor, ceiling and wall-plate of all cells are reinforced by panelling of 2 by ⅝-inch tool-steel channel battens with round edges, neatly mitred and rivetted on in pairs on opposite sides, from four to 6 inches apart, with countersunk ⅝-inch rivets ground smooth. The partition-wall between cells are made with double ¼-inch plates with 8-lb sheet lead rivetted between them. Each partition is made of two plates with butt joints and double 4 by ⅝-inch splice-plates, and ⅝-inch rivets on 4 inches pitch. All the cell-plates are re-rolled toolproof steel, made of either Brooklyn chrome steel or "white diamond" steel. The former consists of three ply of iron and three ply of steel, and the latter has a soft iron core and a covering of converted steel. The plates were made under the constant supervision of inspectors, and were tested by ⅜-inch drill-holes 6 inches apart and by burglar-proof saws on the edges.

The fronts of the cell partitions are covered by plaster made of steel angles and panelled plates, they also form the door-jamb and are reinforced strongly enough to receive the lock-bolts which they are mortised for, and have ornamental cast-iron capitals and bases. The doors slide horizontally and are hung with two trolleys each from a track supported at intervals of 18 inches and enclosed in a continuous horizontal track-box with wrought-iron mouldings. The trolleys are strong enough to carry 1,800 lbs. each, and have double wheels with ball bearings. Above the track-box there is a continuous transom about 6 inches high, with ¾-inch square steel-bars 3 inches apart.

The cell doors are about 32 inches wide and 6½ feet high, with rivetted frames of 2 by ¾ by ⅝-inch steel channels and vertical ⅝-inch octagon steel bars 4 inches apart. The bars

pass through four 2 by 1-inch intermediate transverse strips, and have 3-inch octagon bars 4 feet long in the spaces between them. The balconies are enclosed by vertical square steel bars 9 inches apart, and have at the stairway doors similar to the cell doors.

Each cell is independently locked by a dead-lock, a snap-lock and a lever-lock, all of which may be used separately or together. A horizontal 1-inch chrome steel bar extends continuously across the fronts of all the cells in each row, and is carried in the track box over the cell doors. These levers can be moved from the lock boxes in the centre of the prison, so that bevelled dogs welded to them engage vertical bars attached to the three hook bolts on each cell door. The dogs fit the bolts free of the catches and thus unlock all doors in that row at once. The three bolts for any cell can also be simultaneously lifted independently of those on any other cell door by a handle-lever on the outside of the cell door, so that any door may be opened independently of the lever bar. The vertical bolt-bars are also pivoted to a system of links, which, when the door is dead-locked by a key, displaces them laterally enough to prevent the lever dogs from engaging them and so renders that door independent of the opening and closing of the other doors in the row. Finally, the lever bar has a second set of dogs which engage slots in plates in the top of each door, and so hold the doors securely from being slid open, even if the hook bolts are all released.

The Yale lock on each cell door has five pin tumblers, and the position of the keyhole indicates whether the bolts are dead-locked or spring-locked. The three 1½ by ½-inch bolts and the connecting and operating bars are protected and enclosed by chrome steel armour plates ¼ inch thick, rivetted on both sides of the door. A spring opener is fixed in the doorway jamb so as promptly to throw the door far enough when the bolts are released to prevent their engaging again until the door is fully closed. It consists of a horizontal coiled spring with a ¾-inch plunger having a ½-inch longitudinal motion. The bottom of the door slides between two bevelled angle flanges, and engages a rivetted stop and heavy rubber buffer.

In each cell there is hinged to the wall a steel bunk, made with a 1½ by 1½ by ¼-inch angle iron frame and 1 by 1-16-inch lattice bars with 3-inch mesh. A hinged steel table, a steel shelf and two clothes-hooks are also rivetted to the walls in each cell. The cell floors are covered with a 2-inch North

River bluestone slab in two pieces, with rubbed upper surface. The stones are bedded in 1:2 Portland cement mortar, and the ½-inch joints between them are caulked with hemp and run full of molten lead. All steelwork was painted one coat of pure linseed oil at the shops, and after erection was painted two coats of "superior graphite" paint and two coats of pure lead and linseed oil and finished with two coats of "porcelite." The panelled work was painted cream colour, the doors, cornices, transoms and ceilings were painted white, and the base of cells, 12 inches high, was painted black.

The brackets for the lower balcony floors are of cast-iron, and those for the upper balconies have double ¼-inch steel web plates with flange angles; all are rivetted to the steel plates in the front walls of the cells. The outer ends of all brackets are partly carried by 1-inch vertical suspension rods, continuous from the fourth floor girders to the lowest tier of brackets. The outer ends of brackets are rivetted to a fascia girder made up of 8-inch channels and steel plates with wrought-iron mouldings. The balcony floors, stairs and landings are laid with slabs of 1½-inch sea-green polished slate. The grating walk at each cell floor level in the utility corridor is made of 2½ by ¾-inch steel bars, edgewise, with cast-iron spool separators and ¾-inch tie rods. In the centre of the grating there is a ¼-inch steel plate to receive the rubber matting. Under the first tier walk, and over the eighth tier ceiling, there is a burglar-proof grating similar to the cell transoms, attached to the steel floor beams.

Messrs. Horgan & Slattery designed the cells.

### ACETYLENE GAS GENERATORS.

IN January last a circular was issued from the Home Office to the various manufacturers of acetylene gas generators inviting them to submit their apparatus for a test, to be made under the direction of a special committee appointed by the Department of H.M. Inspector of Explosives. The manufacturers in nearly every instance gladly availed themselves of this offer, and forty-six different generators, representing nearly the whole of the various types of generators in use in the United Kingdom, have been tested. A report has been issued which embodies a short description of each apparatus submitted, and the efficiency of each apparatus is given.

Although the generators submitted have in no instance shown evidence of being otherwise than safe under the con-

Liberal Commission allowed to BUILDERS AND ARCHITECTS for introduction of Business.

Subscribed Capital, £2,228,875.

ditions of the test to which they were subjected, the committee consider many of them are unnecessarily complicated in design, and some are not sufficiently strong in construction. They state that the points to be considered in the selection of a generator are:—Simplicity of action and design, strength of construction, high efficiency as indicated by the yield of gas per pound of carbide, low pressure in generator and facility of removal of the residue.

The machines tested can be divided into three classes:—Non-automatic; automatic "carbide to water" generators; automatic "water to carbide" generators. In the first class ten generators were submitted, eight of which, however, failed to come within the standard of efficiency considered safe by the committee, viz. 90 per cent. of the possible yield of carbide. The remaining two, which came well above the limit, were the Ideal, 99.80 per cent. efficiency; Willeys No. 2, 96.15 per cent. efficiency. With this type of generator a storage holder is necessary of sufficient capacity to take up the total yield of gas from the carbide contained in the generator, and it is in this respect that it varies from the automatic class, which are intended to generate the gas as required for consumption.

English inventors appear to have found the automatic carbide to water problem a difficult one to cope with, though the system is largely adopted on the Continent and in America, as only six generators of this class were submitted, and four failed to reach the standard of efficiency laid down by the committee. The machines which passed satisfactorily were:—Strode's "Perfect," 94.72 efficiency; Hesperus (portable), 94.28 efficiency. The great advantage of the carbide to water generator, properly constructed, is the purity of gas generated and absence of after generation, which next to absolute safety are the chief essentials of good acetylene gas generators.

Twenty-nine firms were represented in the water to carbide class, sixteen with generators having an efficiency of 90 per cent. and over, and thirteen whose generators did not reach this:—Sunbeam, 99.39; Economic, 98.8; Gregory Smith No. 1, 98.8; Allen, 97.59; Moss's, 97.54; Strode's, 97.52; Sir Chas. Forbes, 97.05; S. C. Sovereign, 96.85; Auto-Simplex, 96.74; Imperial (1 lt.), 96.00; Owens, 95.04; Home and Colonial No. 2, 94.31; Rosco Automatic, 91.46; Salisbury "Bleriot" (motor lamp), 90.47; Leading Light, 90.20, and Read Halliday, 90.00 efficiency.

The efficiency in some instances was under 70 per cent, and it is difficult to account for a loss of over 30 per cent. of the total yield of gas. It would have been interesting to know

something of the conditions under which the machines were tested. For instance, the amount of carbide with which each machine was tested, the number of hours each machine was run, the purity of gas generated, and if any generators were tested with purifiers attached.

We suspect that the low efficiency in a good many instances was caused by a purifier, which not only took the impurities out of the acetylene, but evidently part of the gas itself. War also absorbs acetylene gas, one cubic foot of water taking one cubic foot of gas, and consequently machines having great bulk of water would show a low efficiency until the water became saturated with gas, when the absorption would cease except when the pressure in the apparatus was high, when the water would always be a certain diffusion of gas from the water in the air.

The committee give in an appendix the various conditions which a generator should fulfil to be considered safe, which may be summed up as follows:—Low temperature, efficiency 90 per cent., gas pipes to be of full size, complete decomposition of carbide in the generator, low pressure, absence of impurities, precautions taken against freezing, lime sludge not to have access to gas or water pipes, glass gauges to be avoided, space small as possible, copper parts to be avoided.

We know as a fact that a great deal of harm has been done to the acetylene industry by the cheap and imperfect machines put on the market in the early days, and also by the unskillful manner in which installations have been fitted up, so that acetylene gas has been stigmatised as a stinking nuisance, and the unfortunate possessor has gone back to the old-fashioned oil-lamps and candles, and relegated the generator to the scrap-heap. With a good generator, properly fitted pipes and properly constructed gas-fittings, an acetylene gas installation can be made a perfect success. One must, however, go to a firm of good standing who have a reputation to maintain, and who can give their client the benefit of practical experience. There is a great future for acetylene gas. It is an ideal light, and specially suitable for country houses, churches and isolated buildings, and even villages. The initial outlay is comparatively small, and with calcium carbide at 2. per ton, at which price it can be delivered anywhere in England, the cost of the light is no more than coal-gas at 1. per 1,000 cubic feet. Calcium carbide can be produced on the Continent and in America at about 12. per ton, and there is every prospect of the production in England being considerably cheapened.

# The Architect.

## THE WEEK.

THE late Sir ANDREW CLARKE, who died on Saturday, was the most versatile of modern Royal Engineers, but it must be recorded to his credit that he never attempted to pose as an architect or to interfere with civilian architects. He seemed to be equally adapted for war and civil administration. He was Surveyor-General in Victoria, and he helped to frame the constitution of the colony. He was an elected member of the Legislature, and acted as Minister of Public Lands. In course of time he was appointed Director of Works for the Admiralty, and did much to improve the fortifying of Chatham, Portsmouth and Plymouth, together with other arsenals in the Colonies and India. In India he served for five years as Minister of Public Works, and the problem of water-supply long engaged his attention. In 1882 he was selected for the post of Inspector-General of Fortifications. For Malta he designed remarkable dock-gates which were carried out by Messrs. EASTON & ANDERSON, and his floating dock in Bermuda was at once recognised as a great invention. Although he rendered the State so much service, it could not be said that he was rewarded as liberally as many officers whose work was less enduring.

THE oration which was delivered by the Emperor of GERMANY on the completion of the Sieges-Allee in Berlin was not received with much favour by critics in Germany or in foreign countries. His Majesty likes to give surprises, and in an age which is every day becoming more realistic he advocated the adoption of idealism as the aim and object of every artist. All things come to him who can wait, and a formal declaration in favour of the Imperial suggestion has been sent from Monte Casino, the ancient convent which was for so long the home of scholars and artists as well as monks. It appears that a brotherhood of German monastic artists have undertaken as a duty to adorn the tomb of St. BENEDICT with mosaics, reliefs in stone and bronze, and works in granite and porphyry, as a tribute to the founder of the great order that helped to civilise Germany. They declare that they have been inspired by the love of the ideal which the Emperor recommended, and also believe that it is closely connected with the welfare of mankind. The Emperor thanked the monks through the ambassador in Rome, not only for the address, but for their labours in the adornment of the renowned abbey. The history of OVERBECK and his friends in Rome reveals that sixty or seventy years ago an effort was made by Germans to restore the practice of early Christian art. They anticipated the pre-Raphaelites, but their attempts were of a different character. The German works could be said to follow the ideal, for they were more suggestive than representative, while the English artists lingered over details. But if tradition alone is to be observed, all that has to be done is to imitate the example of the religious painters of the Greek Church. It is possible in Paris to buy to-day *icons* which correspond to a hair with altar-pieces which were produced in mountain monasteries ages ago. The German brotherhood will have, we suppose, a different ideal, for as they must have Western ideas they are never likely to agree that only one type for each holy person can be allowed.

ALTHOUGH judgment has been given in respect of the accident that occurred on the stage of the Variétés in Paris at the end of last year, it must not be concluded that the law suits have come to an end. In addition to the 700*l.* awarded last week the two plaintiffs may yet receive much larger damages, and there are a great many additional claimants to be compensated. Modern performances rely for much of their success on carpentry. It is to be expected that the failure of the carpenter's work will cause financial losses proportionate to its importance. Indeed, as woodwork has become so influential, a French writer feels the highest compliment has been paid to him when he is

informed that his book, play or poem is an excellent piece of carpentry. In the Variétés a staircase was to be presented as an attraction in a "revue." Apparently the constructor considered the framing ought to be in keeping with the dialogue and the scantily-dressed performers. He neglected to screw the parts together, and the glue was not allowed sufficient time to dry. The stage-carpenter professed to be ignorant of the load that was to be brought on his handiwork, but several witnesses testified that he was aware of the arrangement. The judges were of the same opinion, and inflicted a fine of 200 francs upon him, a sum that is out of proportion to the sufferings caused by his carelessness. In all theatres there is far too much reliance on the empiricism of the mechanics. The kind of spectacles which are now produced necessitate more knowledge than the men possess, and we hope it will not be necessary to demonstrate that fact by catastrophes in this country. The director of the theatre will have to pay 10,000 francs to a young actress of sixteen, and 8,000 francs to the venerable M. LASSOUCHE as provisional compensation. But those sums are only fractions of the total amount which will be demanded by the remaining victims.

WHEN the portrait of RICHARD II. was discovered in Westminster Abbey it excited extraordinary interest. It was restored under the direction of GEORGE RICHMOND, R.A. The picture was a revelation, and confirmed the belief in the weak-mindedness of the king, and suggested the absence of exaggeration in SHAKESPEARE'S tragedy. In the WINTON collection is another portrait, which is no less expressive. The question arose about the origin of the portraits and the painters who were likely to have produced them. Mr. CARPENTER, of the British Museum, was in favour of a Bohemian artist, while GEORGE SCHARF believed the portraits were by Italians. Mr. C. F. BELL, of the Ashmolean Museum, Oxford, now supports the Bohemian theory. RICHARD'S first wife, ANNE, was, he says, accompanied by a numerous band of Bohemian followers, amongst whom a painter may with great probability, considering the flourishing state of the arts at the Court of Prague, have been included. "The enlightened mind of this short-lived queen, displayed in her sympathy for the doctrines of WYCLIF, is traditional in history, and it is surely not over-hazardous to conjecture that for the first breath of the Renaissance, as well as for the earliest light of the Reformation in England, we may be largely indebted to her fostering care." There was a connection at the time between England and Bohemia. When MOWBRAY was banished by RICHARD II. it was understood that during his exile he was to remain in Germany, Hungary, or Bohemia, and out of his great estates he was allowed to reserve 1,000*l.* for his expenses. Mr. BELL alleges that the exhibition of early Bohemian pictures which is now to be seen in Prague is a convincing proof, from the similarity of style, that the two portraits of RICHARD II. have had a Bohemian origin.

THE French are so impulsive, it is not surprising that sometimes workmen go on strike without giving an hour's warning to their employers. Any action of that kind is, however, contrary to the spirit of French law. The obligations of the men have just been announced by the Advocate-General. It appears that their right to join in strikes is limited by the rights of other parties, that is to say, of employers, and therefore signifies that the ordinary relations between employers and employed must be respected. If artificers were allowed to suddenly stop working under pretext of a strike, and in that way failed to carry out an implied contract, it would be also equitable for employers to combine and dismiss their men without any notice. If employers were to imitate the men, thousands of workmen could be at once cast into the streets, and in France that would mean a crisis. The test case which produced the statement was that of a locksmith, who was summoned for taking part in a strike of building workmen. He maintained that he did no more than make use of "la loi des grèves," which was one of his privileges as a citizen. But the Courts confirmed the judgment of the Civil Tribunal, and ordered him to pay 28 francs or a week's wages in lieu of notice.

## STONEHENGE AND ITS APPROACHES.

THE agitation about the enclosure of Stonehenge may not at present be general, for people have now to turn their attention to more pressing subjects than the possession of a few mysterious stones. But it is sufficiently important to deserve consideration. Stonehenge is one of those cases which suggest anomalies in English jurisdiction. It is commonly assumed that the stones and the land about them to an indefinite extent, as well as the approaches from all towns and villages in the vicinity, belong to the public. People who think in that way do not realise how infinitesimal a portion of this country can be legally regarded as national property. It would be impossible to indicate the extent on any ordinary map. Even commons, which from their name would be concluded to be part of the general estate, are in many instances held on so uncertain a tenure that encroachments seem to be always impending and are resisted with difficulty. The land of England was once admitted to be the property of the monarch. He made grants under certain conditions to his favourites or to religious bodies. But the principle of individual ownership is still paramount, and there is nothing unwarranted or peculiar in the belief that a monument like Stonehenge, of which the origin and purpose are unknown, stands in the same category as Hyde Park or Richmond Park.

In the case of Stonehenge there was for a long period much indifference about the ownership. The land bearing the name of Salisbury Plain was not valued for agricultural purposes, and that may account for the treatment of it as if it belonged to nobody. STUKELEY, in the middle of the eighteenth century, lamented an encroachment on the margin of it by the plough, which, he said, "threatens the ruin of this fine champaign, and of all the monuments of antiquity thereabouts." To his mind any alteration of the ground was as unauthorised as meddling with what he thought was the prehistoric Westminster Abbey of Britain. Space is absolutely needed in order that the stones shall produce their full impressiveness on the mind of the visitor, and what more natural than to suppose that space and stones were an inheritance from remote ancestors? In the description which EMERSON gives of his visit to Stonehenge in company with CARLYLE he dwells especially on the effect of the large area around the monument, as if one was the complement of the other. He says:—"On the top of a mountain the old temple would not be more impressive. Far and wide a few shepherds with their flocks sprinkled the plain, and a bagman drove along the road. It looked as if the wide margin given in this crowded isle to this primeval temple were accorded by the veneration of the British race to the old egg out of which all their ecclesiastical structures had proceeded." EMERSON was under the delusion that Salisbury Plain belonged to the British public, and if the stones could have been brought to America a still wider expanse would be assigned to display them. CARLYLE, however, who was in one of his grumbling moods, desired that evil might fall upon all those who would use the downs for a wretched sheepwalk when so many Englishmen were hungry and wanted work. "But I heard," adds the more shrewd American, "afterwards that it is not an economy to cultivate this land, which only yields one crop on being broken up, and is then spoiled."

EMERSON would be likely to have lost his philosophic equanimity if he had realised that in wandering round the stones and clambering over them he was a trespasser on a private estate, and that most of the tracks across the plain which lead to the enclosure were more like garden walks than public thoroughfares. Englishmen were no less in the dark. There is uncertainty about the origin of Stonehenge and the purpose for which the stones were raised. They may be 6,000 years old or date from a remoter or nearer time. But amidst so much that is doubtful there is no question that the remains and the ground on which they rest belong to Sir EDMUND ANTROBUS, and he can deal with them in exactly the same manner as he would with the rest of the estate which he has inherited. And here let us say that much credit is due to Sir EDMUND ANTROBUS, as well as to his predecessors in title, for the interest taken in Stonehenge. There may be difference of opinion about the prudence of the recent measures which

were taken for the preservation of the monument, but archaeologists must respect the motives by which Sir EDMUND ANTROBUS was actuated.

It is also well to understand that some of the objectors who are opposed to him are not entirely disinterested or inspired solely by the love of archaeology. The parish council of Amesbury have taken the initiative in persuading the county council of Wilts to hold an inquiry into the enclosure of Stonehenge and the interference with the rights of way to the monument. But in the petition it frankly admitted that obstruction is detrimental to the best interests of the parish, "which has enjoyed considerable benefit from the hitherto free and open condition of the monument." If translated into other words, it means that the people of Amesbury derive profit from the visitors to Stonehenge, and if the number should be reduced by a wire fence or restriction to one route across the plain, then there would be a financial loss; and to avoid that result efforts are made to induce others to become the defenders of the Amesbury rights. The grievance cannot, however, be felt beyond the parish boundaries, and it is likely to be much more circumscribed. This is to be inferred from the indifference of the Amesbury rural district council on the subject, for the members declined to take action after hearing all the particulars. The parish council had then to memorialise the county council, and an inquiry was held last week, with what result has yet to be made known.

As we have said, the objections are based on two grounds. In the first place the enclosure has been surrounded by a fencing of barbed wire, and a fee of 1s. is now charged to anyone who wishes to pass through it. There is something absurd and incongruous in protecting so ancient a memorial by means of lines which have been disapproved when set up as a substitute for hedges. Barbed wire may be useful as a defence against Boers and hunting men, but on that account it seems out of place as an environment of a few dismal stones on Salisbury Plain. It is, however, unobtrusive, and it is cheap and effective. Sir EDMUND ANTROBUS has expended money in setting up some of the stones and in adopting constructive provision for their stability. He has not exceeded his rights when he seeks to recoup himself for a part or the whole of his outlay. Moreover, with a wire fence there is less opportunity for knocking off pieces of the stones by vandals and, in proportion as interest is taken in Stonehenge, the stronger is the desire for individuals of a certain class to possess fragments of their prowess in breaking rules.

In the second place there is a resolve to close most of the tracks which cross the plain, and which were suggestive of public rights. There is no doubt that evidence is forthcoming by the drivers of vehicles from Wilton or Salisbury who could follow more than one course to the enclosure. That was a convenience, especially on occasions such as June 21, when about two thousand people make the journey to Stonehenge in order that they may see the sunrise, and in that way imagine they obtain a key to the mystery surrounding the place. How far that use under the peculiar circumstances created a public right, we need not inquire. But it is certain that the rural district council, in opposition to the parish council, expressed themselves as satisfied with the removal of certain obstructions on the highways, but declined to offer an opinion as to the rights of public access to Stonehenge.

While admitting to the fullest extent the privileges of ownership, it is none the less to be regretted that so unique a treasure should not be under the guardianship of the highest authority in the land. Stonehenge is a title-deed through which the country can claim acceptance by the rest of the world as being the scene of rites and ceremonies in a remote age. It is one claim to distinction. There are prehistoric monuments in various places on the Continent, but none of them seem to have been arranged with the same care that is visible at Stonehenge. It does not matter whether the purpose to be served was astronomical, or monumental, or ritualistic; the fact remains that some determined plan was realised in the arrangement which brought renown to the island. From what is known of ancient customs it is not unlikely that Stonehenge served as a goal for tribes of men, as Mecca and other places still serve in our time. Property which possesses so much national importance is not adapted to be held by any individual,

however appreciative of its interest. Although in England it is not easy for the public to acquire private property, yet the Ancient Monuments Act allows of arrangements being made by which the State can perform the duties of guardian while leaving to the owner all other proprietary rights. In no case can an individual guarantee that his successors will hold the same opinions as himself, and it would be possible hereafter for an owner of Stonehenge to inflict irreparable injury on the country by his treatment of the monoliths. That is a prospect which we are confident Sir EDMUND ANTROBUS would regard with horror; but against it there is no security unless through the intervention of the State. Under the control of Government the safety of Stonehenge would be secured. There would be no interference with private rights in roads or tracks; there would be no displeasing enclosures. Stonehenge would then become, not only a relic of antiquity, but a memorial of the patriotic spirit of its present owner.

### ANGLO-AMERICAN BUILDINGS.\*

THE superseding of the English timber church by one of stone or in the Roman manner was a revolution, although it may now appear no more than a mere change of fashion in building under foreign advice. Timber, it should be remembered, was a material which possessed peculiar associations for the most energetic if not the most numerous of the inhabitants of England. There were so many forests in the Germany of their ancestors, the trees came to be regarded as if they were natural forces of more importance than the men who found shelter and protection amidst them. The Romans related that the forests were sacred to the Germans, and when the ancient belief became more restricted, particular trees were selected for veneration. The Yggdrasil ash was long accepted in Northern mythology as a symbol of the world, and the names ash and alder were long applied to men. The conditions of life of another part of the Germanic race were also likely to give interest to timber. The sea-rovers who were connected with the British Isles as invaders and as settlers spent a great part of their lives—that which they most enjoyed—in timber vessels, and their houses to some extent resembled their boats. In Iceland, where we are best able to study the characteristics of the race, there were no towns in the modern sense of the word. The nearest approach to one was made up of detached homesteads, for the Northmen could no more realise the advantage of a collection of houses united in a street than of boats cabled together in the firths. The people wished to be as independent on land as on sea, and the desire was furthered by means of timber houses.

We can well understand how strangers from Rome coming to Germany would conclude there was a relation between timber or forest temples and idolatry or nature worship. Missionaries would advocate the employment of stone as more Roman and more orthodox. In England also an effort would be made to attain a like result. The history of Ripon Cathedral affords an example of the consequences which followed the attempt to introduce the Roman manner. St. WILFRID offended the monks and people of the district by erecting a building which was of stone, and supported by columns and pillars. It was considered to be a foreign innovation, and much prejudice was excited against the prelate on account of it. One cause of the dislike to stone probably arose from the circumstance that in some of the Northern traditions stone-pillared dwellings were said to be found only in Hell (Hades) or on the road thither.

The influence of churches on buildings of a different class cannot be measured by what takes place in our time. The church was supposed to be the nearest approach to perfection, and inspiration was derived from it, if only remotely, for domestic buildings. The use of stone, apart from its endurance, was however an agency in our progress. It not only required skill in its employment, but it led to other arts. To obtain stone it was necessary to employ

quarrying, and a wall would not last or keep out bleak winds without the use of mortar. The adornment of stone by carving was also more difficult than with wood, and, in fact, to produce a church or a house of masonry was a less simple affair than if they were formed of timber, and in that way development was aided.

In course of time, however, convenience rather than precedent dictated the materials for buildings in this country. The Saxon found he could be sufficiently safe in dwellings where timber was largely if not entirely employed. The Norman, who distrusted the people he oppressed and knew the skill in attack of his fellow strangers, believed in thick stone walls with openings reduced to the smallest dimensions. At a later date a compromise in the form of half timber, like compromises in general, found much acceptance not only in England but in Normandy. Although it might be presumed the combination was not likely to insure substantiality, many of these houses have survived during several centuries. We owe much to the old wood-workers who have produced so many lasting examples of building which sometimes suggest forms that appear to be native and sometimes are derivative, although it is not clear how English workmen could have become acquainted with the originals. Americans will, therefore, although they possess only partial evidence of the English craftsmen's scheme, agree with Mr. PAUL WATERHOUSE when he says in one of the essays introduced in the collection of Colonial Work:—

I think that the house carpenter has somehow lacked a poet to sing his praises, and even historians have rather allowed him to be overshadowed by the mysterious mason. There can be little doubt that for centuries the carpenter was, in England, the great transmitter of tradition, the great artist in construction, and a contriver of so high an order as to merit the name of designer. He was a great man in Gothic times; he was a great man still in Renaissance and Georgian times; and whereas the mason undoubtedly changed his personnel, occasionally being at one period and another a foreigner, introduced to carry out the new ideas from the Continent, whether Italian or Dutch, I expect that our friend the carpenter must have endured much less of foreign substitution. With the versatility of his craft he lent himself easily to the new modes (which were, in truth, such old ones), and found with all the joy of an artist that these cymas and ovolos, flutes and astragals, were the very things his tools were meant to work. He was, without more ado, at home with these bits of Rome and Greece. He worked, he prospered, and became the backbone of Georgian art.

In the United States they cannot point to examples of half-timber work, although in some New England houses they claim to have something which is distantly related to it. There is, however, the overhanging upper storey, which was at one time explained as a mode of defence against Indian enemies. The arrangement is now considered to be no more than an imitation of an English method by English carpenters, and which was followed by their descendants. If LONGFELLOW can be taken as an authority, it was also to be found in the French village of Grand-Pré, Nova Scotia:—

Strongly built were the houses, with frames of oak and of chestnut,  
Such as the peasants of Normandy built in the reign of the Henries.  
Thatched were the roofs, with dormer windows; and gables projecting  
Over the basement below protected and shaded the doorway.

The history of Boston begins with the seventeenth century, and in consequence much interest is attached to whatever recalls the early settlers and their immediate successors. A Boston newspaper has obtained information from correspondents which proves that in Massachusetts alone there are over 150 buildings of that time, some being constructed in timber, including the House with the Seven Gables, HAWTHORNE'S birthplace, and sundry houses which history or fiction has made memorable.

There were other settlers besides those who fled from England for conscience sake. It is sometimes difficult to say whether an old building in an American town is English or Dutch. Apparently, undoubted Dutch work is very circumscribed in its habitat. According to one of the writers, "Aside from the immediate neighbourhood of

\* *The Georgian Period*, being Measured Drawings of Colonial Work. Part IX. Boston: American Architect and Building News Company.

New York the work of the Hollander had little direct influence on the building done in America during the eighteenth century, and this is all the more disappointing since one of the myths relating to the gambrel roof is that it was derived from Holland."

The influence of Germany is wider, but is very quietly expressed. The German, although he always has had a grandson's affection for his old country, cannot escape the longing for an ideal even in existence. Every reader of "Evangeline" remembers how in her search the Acadian girl sometimes found refuge "in the tents of grace of the meek Moravian Missions," and how in the early dawn the German farmer met her returning home from her watchings. The history of the emigration is saddening. It is recorded that in one year two thousand Germans died during the passage across the Atlantic. There were various settlements, but Pennsylvania attracted them beyond all the other parts. There is not much of their work, however, to be seen in Philadelphia, for the Quakers who held authority in the town despatched German immigrants, as they were skilled in arms, to various places along the frontiers. Bethlehem was founded in 1741, and its name was given to it by Count ZINZENDORF, the Moravian. In the church the German love of music still prevails, and the following description of one of its consequences is interesting, especially as the influence of music upon exterior architecture is a subject which has not received much attention:—

At Bethlehem the trombone is *par excellence* the instrument, and its use, or rather one of its uses, has had a curious effect on architecture. Just as in some towns the "passing-bell" is tolled in the church tower as the weary soul has just taken its flight, the same function is at Bethlehem discharged by official trombone-players, four in number, whose duty it is to ascend to the tower of the church and there blow to the four quarters of the town the news that brother or sister, maid, man or widow lies a-dying, the age, sex and marital condition of the departing being indicated by the chorale that is played. This custom brings it about that the church tower must be provided with a platform or gallery, around which the players can pass, and from which they can blow their mournful messages.

In the Moravian buildings double ranges of dormers are to be found, which recall the high roofs of German towns, and as was to be expected from so careful a fraternity the buildings, although some of them are 160 years old, are in excellent condition. By the irony of fate the chapel, with its house and the Gemein-haus, form "a curious contrast to the great industrial plant in the once quiet township which now turns out armour-plate and great guns." The "Old Trappe Church" at Collegeville is very humble, and dates from 1745. It resembles a Dutch church at Sleepy Hollow in Tarrytown, which, in spite of its simplicity, has inspired a good many modern churches. The old Swedes Church at Wilmington, which was erected in 1698, is still used. The love of antiquity can be gauged from the fact that the congregation of St. Paul's Church, Boston, although it is not very old, refused a million and a half of dollars for the site. English associations are also revived by numerous inns. Their origin is thus described:—

Men of business as well as men of peace, the Quakers of Philadelphia were the connecting link between the farmers and trappers of the interior and the mother country, and in prosecution of their business they and others had to travel widely over the State; and as Pennsylvania is not as well served with rivers as is Virginia, their journeys had to be taken on horseback or in some form of vehicle. Along the travelled roads, then, that were thus created in every direction, there were established after they had become stage routes numerous inns and taverns, many of which, being as substantially built as other buildings of the time and district, still exist, a few still serving as inns, and others converted to different uses. These inns seem generally to have been kept by English hosts, for the sign-board that swung before the inn usually bore a name and painted cognisance of the same class as those that hung before many an old English inn, and we hear of "Red Lions," "White Horses," "Mariner's Compasses," "Blue Boars," "Rising Suns," and so on in different directions. Perhaps the oldest of these inns now extant is the "Jolly Post," on the Frankford Pike, built in 1680; but as the Lancaster Pike was the first turnpike road in the State, some of the many inns along its length may be older yet.

In reading the descriptions and glancing over the plates of the latest addition to the series of "The Georgian Period" we seem as if we were still in England. There is so much that is homelike, it is difficult to realise how wide a space separates us from the buildings which are illustrated. We should be thankful that the English emigrants were not endowed with much imagination and relied mainly on the memory. Their treatment also indicates a characteristic of the race, for under new conditions which would seem to invite license, tradition is respected and laws are observed although they may not be the best of their kind. The early Puritans continued the church services and the mode of administration of justice with which they were familiar in England, and the carpenters and masons repeated the old forms which they had produced in English towns and cities. Modern Americans cling to the buildings with affection, and it is gratifying to find that there is a demand for the exact representations of details which constitute "The Georgian Period," every part of which should be almost as interesting to Englishmen as to Americans.

## STRUCTURAL COLOUR DECORATION OF THE INTERIOR OF PUBLIC BUILDINGS.\*

IT is a remarkable fact that since the sixteenth century in England the practice of decorating in colour all our buildings, both public and private, as a natural and expected action, has declined. It is as if our countrymen, who lavished colour in cathedral and castle during the centuries preceding the Reformation, had suddenly lost all hearty desire to beautify their buildings in this particular way. We know that England was not behindhand in knowledge of the decorative arts. The remains of the noble craftsmanship in painting and sculpture of the thirteenth and fourteenth centuries go to prove that Englishmen knew how to paint and to carve. The late Professor Middleton has said of English art from 1260-1320:—

"The painting of England was unequalled by that of any other country; even in Italy, Cimabue and his associates were still labouring in the fetters of Byzantine conventionalism, and produced no works which for jewel-like colour and grace of form were quite equal to the painting under Edward I."

Encouraged by kings such as Henry III. and by the Church, English artists decorated Canterbury, Westminster, Salisbury and countless buildings throughout the land; but the civil wars, the coming of the Renaissance from abroad, the fall of the Church and the growth of Puritan feeling seemed to paralyse the development of native decorative art. No Pinturicchio arose here as in Italy, no Raphael to work with the architects in the adornment of public buildings. The Renaissance, instead of adding to our confidence and energy seemed to condemn us as insular, to be without artistic knowledge, unworthy to paint frescoes. Little belief in our powers was shown by those in high places, by those able to commission and encourage. Was sculpture needed, or painting, the artists must come from abroad. Torregiano must make the king's tomb; later, Rubens alone can paint the roof at Whitehall, just as Vandyke must paint the portraits. Verrio must paint the ceilings and walls at Hampton Court. Though, through it all, there were English painters whose works we know, and many art craftsmen, the English artist was eclipsed by the superior skill of the foreigner. With the advent of Wren, the great English master, we find our countrymen again employed in important work, Streater in the Sheldonian at Oxford, and still later, Sir James Thornhill at St. Paul's and at Greenwich.

It has been said that the revival of letters 400 years ago made it no longer so necessary that the walls of public buildings should furnish a literature for the people, and thus a great incentive to noble, historical and allegorical painting died. Together with the sciences, the painters became learned and conscious. The naiveté of the earlier masters changed to greater care in exactness of representation, but with the old impossibility of the human race to do all things well and perfectly at one and the same time, their works lacked the simplicity and dignity of the earlier period. Architecture thought more of itself and less of the other arts which were previously combined with it to form an organic whole. If she used painting it was more as a mistress employs a handmaid, and less as an equal co-operating with an equal, and painting apparently would have it so. Instead of covering wall surfaces with representations of noble deeds by great men, or pictures portraying the mightiness of virtue and the baseness of evil as in the days of Giotto and Lorenzetti, she wasted her powers, her perfect knowledge of technique, in extravagant flatteries of

\* From a paper by Gerald C. Horsley, read before the Applied Art Section of the Society of Arts.

her employers, such scenes as we see Rubens painted for Marie de Medicis, the Apotheosis of James at Whitehall and the foolish scene of Olympus, by Verrio, at Hampton Court. Can we wonder when we see the purpose of painting reduced to these inanities that the link uniting her to the great art of architecture would not bear the strain, or that we should have seen, as we have seen, painting and architecture widely separated, the one perfecting herself at the easel and the other working experiments in the different styles?

We cannot imagine a more half-hearted or more selfish condition of things, or one more contrary to the spirit of the great days of art. It is, at any rate, to the credit of English architects that they have all along recognised—and with much fulness of late—the harmfulness of the position.

On the other hand, we have also to notice that the Continent has never lost in the same degree as ourselves its interest or delight in the use of colour decoration. Changes not dissimilar to our own have taken place, but the arts of architecture and painting never lost touch one with the other as they did here. In Italy to this day a colour scheme in a new building has a prominent place. In France a church, a mairie, or a theatre, even a railway station,\* is not considered complete until it is painted in tempera or with canvases, "marouffe," so that they form part of the building. Such conditions as these may also be found in Germany and Austria. England alone seems with but few exceptions to disregard colour as a necessary element of beauty in the designs of the interior of her public buildings.

What these exceptions are we may presently consider, but it is time to discuss the two divisions particularly with some regard to our work and practice at the present time. First, those buildings whose actual materials form a colour scheme. This is a method of decoration which was more in favour with the last generation of art workers than it is with us at the present day. We are reminded of the buildings of the "Gothic revival," of the works of Butterfield and Street.

These buildings were the result, no doubt, of visits to Italy, where their prototypes may be found, also of a study of our own Gothic period, when a certain amount of parti-coloured wallwork was done, brought to us by the Mediæval current of art practice from East to West. Modern churches like All Saints, Margaret Street, and Keble College Chapel, by Butterfield, and the church in Garden Street, Vauxhall, by Street, are buildings of this type.

In process of time we seem to have largely passed away from this kind of work; it does not now seem so well worth doing; the results obtained were often cold looking, harsh and mechanical, owing perhaps to the mathematical accuracy of modern building methods, but there was a principle underlying it all, one of value which cannot be lightly dismissed. We must remember that when Butterfield did this work it was a great achievement, a launching out into new methods, a deliberate attempt at a human expression in art, and a clean break away from the (to him) cold and formal, dull and vacuous interiors of 1845. Butterfield, in All Saints, has done this, his first essay in the manner, with consummate skill and largeness of feeling, better than at any later time, and better than any of his imitators, and there were many who followed his lead. Few artists ever took such great pains or had such great gifts as William Butterfield. We must not think that he introduced this coloured work with the sole intention of breaking up the appearance of the wall surface. This was clearly not his main idea. With the "true principles" of the neo-Gothic architect—and here, I think, we have the principle underlying so much of this work—his aim was to get a permanent wall decoration, one which would outlast the usually improperly made plaster wall covering. He recognised the difficulty and expense of securing any form of painted wall decoration, also the deleterious effects upon any painted surface of the fumes from gas lights and oil lamps, and the evilly charged atmosphere of London and our great cities. He set himself therefore to produce something which was suitable, lasting and easily kept clean. He did this admirably. Take, for instance, the wall surface at All Saints, Margaret Street. First there is a dado of full colour some 5 feet high of tiles; above large scenes from the New Testament painted on tiles. Above the arches of the nave arcade the wall surface is stone inlaid with bold patterning in tiles and dark inlay. On the east wall only is there any painting. Here are frescoes by Dyce in panels spaced between margins of alabaster. The roofs are vaulted and painted in the chancel, and painted wood in the nave. With the exception of the pictures on the east wall there is not a scrap of plaster in the church, and no one will deny that the scheme is interesting and good. In Keble Chapel there is a very similar scheme, but in materials more precious as befits a college chapel of such importance. Here the lower part of the wall has an arcading of stone, with the spandrels formed of coloured bricks. Above at a height of some 10 feet from the

floor are pictures, the subjects from the sacred history, in mosaic, and framed in stone. The pictures form a large and striking frieze running round the chapel; above it are the windows filled with painted glass, at some height, therefore, from the floor. Between and above the windows are more bands of coloured brick. The roof is vaulted, painted to represent stone. Here again, therefore, except in the painted roof, the ground of which I suspect is in well-made plaster, there is no plaster used, and the whole effect is one of great dignity. To our eyes nowadays such a method as this would require to be carried out on the broadest and simplest lines; we should also demand that the materials should be worthy. The black, white and yellow bricks of fifty years ago have few charms for us now.

The system of alternations of colour in a wall surface, which no doubt had its origin—so much as came to us from the East—in the ancient Chaldean and Egyptian worship of the universe, when by building their temples and pyramids in coloured stripes or courses, in due sequence and tints, they commemorated the heavenly spheres, fits in with the natural demand of the eye, which welcomes and recognises the propriety of variety in colour. It is open to us, therefore, to appropriately use the differently coloured stones we have, or our own native marble, while thanks to the discovery and re-opening of some of the old Greek and African marble quarries by men of energy and foresight like Mr. Samuel Brindley, of Messrs. Farmer & Brindley, ancient sources of supply are no longer closed to us. So long as we arrange the materials at our hand, be they of clay or stone, with breadth and simplicity, we shall be treating them with the dignity they deserve; and in buildings of importance we shall, I think, be treating ourselves with greater consideration if we invest our patterns with some meaning and intention.

Such principles as these, common to all forms of art, seem to be especially brought into mind when thinking of this form of treatment of a wall surface. In passing I may point to the Baptistery of Florence, San Miniato at Florence, the church of the Miracoli at Venice, some late Roman examples at Ravenna, as being particularly successful examples of the use of marble in this connection. The cathedrals of Orvieto and Siena are direct descendants of the striped work of the Saracen builders, a method of building common in the East to this day, and dating, as I have said, from her immemorial past.

The second division of our subject, "Those buildings which on their completion have been decorated in colour in a manner which makes that colour one with the materials of the building," offers a larger field for examination. It brings us into touch with the methods employed by our fellow artists the painters and other art workers, and into notice the conditions which govern the employment of artists in these matters. I ventured to point out just now the different state of things 400 years ago in this country compared with the present time. How that then nothing was more natural in most communities than a wide employment of painters and workers in the arts in the decoration of public buildings. The history of the past and the examples remaining to us make this clear. What a contrast presents itself in our own time. Who, for instance, can read the story of the preparations for decorating the Houses of Parliament fifty or sixty years ago without amazement and astonishment at the ignorance of and want of confidence in the capability of the painters of that time by those in high authority? For some twenty years a Royal Commission was in existence to consider and decide upon the best means of painting certain panels and rooms in the new Palace of Westminster. They instituted open competitions, invited cartoons, called for samples of painting in fresco. They doled out a few commissions. The expense incurred in preparing for these competitions and trials in painting must have brought many artists to the verge of ruin, and the many delays and slow procedure disheartened and crushed the spirit of all. If anyone wishes to read the sad story of these years, let me refer him to Redgrave's "Century of Painters," where the whole history is set forth by one who lived during the time, and knew it well. It may be that the Government of our country is too complex and vast an institution to see the advantage of departing from the competition system, and to trust with commissions artists whose works and capabilities are known, the execution of which would add to the intellectual and artistic output of the country. The few examples we have of such a departure have been signal successes. I may refer, as an instance, to the employment of the late Lord Leighton in the frescoes, "Arts of War" and "Arts of Peace," at the South Kensington Museum.

Fortunately, the experience of the Houses of Parliament Commission I have referred to has served as a warning throughout the country to municipalities and to individuals, and it has been, no doubt, easier for municipal councils, who have so much power in their hands, to foster and encourage the arts of the country, and with their less cumbrous governing machinery to avoid the many mistakes it is possible to make in the fit decoration of a building of importance. This is

\* The new Gare d'Orléans, at Paris, which has two large wall-paintings of *Biarritz* and *The Loire* in the waiting hall.

evident by the conspicuous success which has attended the efforts of some of the municipalities of the country. Manchester is most fortunate in having commissioned Ford Madox Brown to paint the scenes from her history in panels in her town hall. Glasgow is employing some of her own sons, Messrs. Henry, Lavery, Walton and Roche, in her city buildings. The Corporation of Liverpool, acting wisely on the advice of their architect, has commissioned Mr. Charles Furse to paint the pendentives of its large dome, illustrating scenes from the commercial greatness of the city. Birmingham has commissioned some of the students of her Municipal School of Art to paint scenes commemorating her history in panels in the town hall. The Corporation of Colchester also, in the new town hall, on the advice of their architect, Mr. Belcher, is employing Mr. Charles Baskett to decorate the council chamber and moot hall, under his supervision and with his assistance. In London, in our own Royal Exchange, the Corporation of the City of London, together with some of the great City companies, have commissioned artists to paint the panels of the ambulatory.

For some years past the municipalities of our towns have been fostering a love and appreciation for our arts by buying pictures and placing them in suitable galleries. This virtue of acquiring beautiful things has now been supplemented by giving commissions for mural painting. In the placing of these commissions we have the greatest hope and encouragement for the future, and with the increase of the municipal councils which is taking place in our midst we may look to see full advantage taken of the opportunities the public buildings present for the employment of artists of proved power and attainment, to the advantage of the people of this country. With this hope in our hearts we may consider with greater interest certain of the methods of work which at the present time are in use.

Before speaking of different forms of painting available, I would like briefly to touch upon the possibilities offered to us by the use of marble, mosaic and plaster, stucco duro and sgraffito. These are so closely allied to the first division of the subject that I would speak of them here. We know that the Egyptians, Greeks and Romans used colour largely in their buildings, but we can have but little idea of the magnificent effects often attained by means of their fresco painting, encaustic painting, tempera, modelled plaster, mosaic, marble linings and veneering, bronze, ivory, gold and silver overlaying, and inlaying.

For instance, we read of the Golden House of Nero, that the walls were encrusted with gems and mother-of-pearl; of banquetting halls having ivory ceilings; of a ceiling in the State dining-room which was spherical in shape, and cut in ivory to represent the constellated skies, and kept in constant motion by machinery in imitation of the stars and planets. This magnificence, inventive and symbolic, partook something of the marvellous and the rare, qualities which we have far to seek in this prosaic age. In their large halls, basilicas and baths, it was also a custom of the Romans to line the walls with marble slabs to a considerable height, and above to use mosaic or plaster reliefs. The vaulted ceilings were generally coffered and decorated in plaster reliefs, coloured and gilt; bronze rosettes were also used in the coffers.

These were general forms of decoration throughout the Roman Empire both in the West and East. We find them used by the Byzantine builders in Constantinople, Sicily and Italy, and we may be of opinion that few finer schemes of decoration have ever been devised. In some manner adapted to our modern needs they are available to-day, and it is understood that marble and mosaic are to be adopted in the new Roman Catholic Cathedral at Westminster.

In considering the use of mosaic at the present time, we may hope that the modern and vicious habit of preparing mosaic tesserae face downwards on a sheet of paper laid on a flat table, and then pressing the sheet of paper into position on the wall has been finally given up. The old and only right method is to fix each tessera into the cement pushed in by hand from the front. Too many works of the last century are deficient in one of the most important elements of decoration, namely, the right technique. Sir William Richmond in St. Paul's Cathedral, the largest example of mosaicwork of modern times, has shown in the work which he has done there that there is no more trouble and no appreciable loss of time in doing mosaicwork in the only true way, viz. pushing it in, tessera by tessera, from the front. His assistants after very little practice have been able to do the work on these lines with the greatest rapidity, and naturally with intelligence and interest in seeing their work in position as it proceeds.

Time will not permit me to speak of modelled plaster and sgraffito in any detail, except to express the satisfaction we must all feel that these ancient arts of tried quality are understood and worked in a modern spirit to-day. The composition of stucco duro has been often described, and we know by the remains of ancient Roman work found in the Villa Farnesina, and of the works of the sixteenth century in the Loggia of the

Vatican, and the Villa Madama and other buildings in Italy and France, what exquisite possibilities this material presents. The work, particularly in the Early Renaissance, was usually decorated in colour. This was generally laid on whilst the stucco was wet as in fresco, and the details heightened with tempera or encaustic colours, and accessories enriched in gesso.

We may congratulate ourselves that artists like Mr. George Frampton, R.A., and Mr. Anning Bell have worked in this material in churches and other buildings in our time. The processes of stucco duro and sgraffito are fully described in the "Arts and Crafts Essays" published in 1893, the former by the late Mr. G. T. Robinson and the latter by Mr. Heywood Sumner, whose work in All Saints Church, Ennismore Garden, affords an example of modern treatment. I need not do more than name these two forms of lasting decoration, peculiarly structural, and available to us to-day.

(To be concluded.)

## INSTITUTE OF ARCHITECTS OF NEW SOUTH WALES.

THE report of the Council for session 1901 of the Institute of Architects of New South Wales is as follows:—The Council has pleasure in presenting the thirtieth annual report. The number of members now on the roll is 68, viz. 3 Fellows, 24 Associates, 2 retired Fellows and 6 honorary members. During the session 5 Fellows, 11 Associates and 1 honorary member were added, making a total of 19 new members for the session. The following are the names of the newly-elected members:—Fellows, Messrs. Alfred Spaine, H. Gardiner Garden, J. S. E. Ellis, D. T. Morrow and Walter Hunt; Associates, Messrs. Donald Esplin, Albert Sparkes, C. W. F. Carter, G. A. Roberts, John Barr, Harold White, G. H. Mathison, Howard Grove, H. V. Vernon, Oscar Backhouse and Peter Wood; honorary member, Mr. J. J. Coher. M.L.A. The Council has to record with regret the death of the late Mr. A. F. Evans, an energetic member of the Institute. The Council has, during the session which now closes, held eleven meetings. Two special general meetings of the Institute were called with the object of altering Article 77, so that the nomination of office-bearers will in future be in the hands of the members themselves, whereas before the alteration it was the Council's business first to nominate the various members for officers and Council. It is hoped that by thus putting upon all members the responsibility of nominating members for officers and Council, more interest will be evoked in the annual elections.

Following upon the Conference of all the Institutes of Australian Architects, held in Sydney during January 1901, a Conference was held in Melbourne during last May to consider the report and draft articles of association of the proposed Institute of Australasian Architects, which were drawn up by the committee appointed at the Sydney Conference. The delegates who were appointed by the Institute to attend the Conference in Melbourne were Messrs. Barlow, Kenwood and the hon. secretary. Mr. Kenwood was unable to attend, and the other delegates, according to the power given them by the Institute, elected Mr. H. C. Kent as the third delegate. These gentlemen submitted the report and draft articles of association in due course to the Conference. Their report of what took place will be very shortly submitted for your consideration at a special meeting to be called for that purpose.

On September 27 and various other dates public meetings convened by the combined efforts of your Institute and the Institution of Surveyors, were held in the rooms to hear and discuss papers on the question of the design of the Federal City, read by the president (Mr. J. Barlow) and Mr. G. H. Knibbs (president of the Institution of Surveyors), and a lively discussion ensued, amongst the speakers being Mr. Alexander Oliver, M.A., the special commissioner appointed to inspect and report upon the sites proposed for the capital, and many gentlemen, prominent citizens and others who hold important positions in the public service. The result of the various meetings was that a committee was appointed to draw up a report embracing certain propositions to be forwarded to the Federal Government. The following sessional papers were read at the general meetings, viz. March 6, the President's address; April 17, "Quantity Surveying in Australia," by the late Mr. A. F. Evans; June 5, "A Book of Building Standards," by Mr. Cyril Blacket (vice-president); August 8, "Fire-resisting Construction," by Mr. R. C. Backhouse.

On October 31 there was forwarded to the Municipal Council of Sydney the following resolution, which had been passed at a business meeting of the Institute, viz.:—"That in the opinion of this Institute the departments of the city architect and the city surveyor should be under separate control."

The Council is pleased to be able to state that this opinion

has been acted upon, and that the department of city architect is now separate and distinct from that of the city surveyor. No doubt much good to the welfare of the people will be the outcome.

On December 9 a large deputation from the Institute, introduced by Mr. J. J. Cohen, M.L.A., and Messrs. James Ashton and Dacey, M's L.A., waited upon the Under-Secretary for Public Works (Mr. J. Davis), in the absence of the State Minister for Public Works, to ask that works of a national character be thrown open to competition, especially the proposed designs for the tenement dwellings to be erected in "The Rocks" resumed area. A statement giving the reasons why, in the opinion of the Institute, the best results for the people are obtained when designs for national buildings are thrown open to competition, was presented, and Messrs. C. Blacket (vice-president), Mansfield and Kent spoke in support. Mr. Davis replied, saying that he would have a verbatim report of the speeches put before the Minister for Works, and a reply would be sent. The Council regrets that up to the present no reply has been received though nearly two months have elapsed since the deputation.

The board of examiners of the Public Service Board had arranged with the Council that the special examination for the associateship should be held in Sydney in June last. The younger members of the profession had given promise of interest in the examination, many applications were lodged, and the Council were given to understand by some that they would certainly sit; much trouble was taken to notify and advertise the examination throughout Australia, and information of all kinds was imparted, but unfortunately not one candidate presented himself. The Council very much regret that this is so, but considers that the failure is due largely to the fact that only the special examination was held. Had the preliminary and the intermediate examinations been also held at the same time many of the younger men would have presented themselves for one or the other, and the initiation of this series having been commenced would, in a year or so, have led up to the special examination without difficulty. The Council felt this so keenly that in the report sent to the board of examiners this reason was emphatically dwelt upon, with the result that a reply had been received from the secretary of the Public Service Board stating that the matter would be put before his committee for consideration.

The Council are also glad to say that there are signs of an increase in the influence and prestige of the Institute. To show that this is so it is only necessary to instance the fact that the president (Mr. Barlow) has been appointed as one of the members of the advisory board. Mr. V. Parkes and Mr. McCredie, other members, are also Fellows of the Institute. It may be also noted as a significant fact that some time since, when the public works committee were considering the question of the extensions to the Prince Alfred Hospital, the President was requested to attend and give evidence. These, amongst many other things, are signs that the Institute is gaining in influence, and that its standing is being recognised by the public and the State Government.

The Sketching Club has unfortunately, for various reasons, not yet been fully started, but intending members are asked to send in their names to the secretary, so that as soon as possible the club may be set going in earnest. Prizes of 2*l.* 2*s.* and 1*l.* 1*s.* are offered for the best and second best sets of sketches.

The Council acknowledge, with thanks, the receipt of various publications received during the session. The Council once more urges upon the members to support the office-bearers in endeavouring to further the best interests of the Institute and of the profession to which we delight to belong.

(Signed) JOHN BARLOW (President).  
G. SYDNEY JONES (Hon. Secretary).

## ARCHITECTURE IN EDINBURGH.

THE architecture of Princes Street, Edinburgh, comprising as it already did some examples of notable excellence, has just been enriched by the erection at No. 136 of new business premises by Messrs. Macvitties, Guest & Co., Ltd. The building, for the following description of which we are indebted to *The Scotsman*, has been in process of construction for the last two years, and has attracted a good deal of attention on account of the façade having certain novel and distinctive architectural features which give the composition an imposing character, and are not to be seen elsewhere along the whole line of the street. Designed by Messrs. Hamilton, Paterson & Rhind, architects, George Street, the building externally does credit to the prominent site it occupies, while internally it marks a great advance on the artistic decoration of shops or restaurants in Edinburgh. For parallel one would have to go to London, or to one or two of the high class restaurants of Paris. It is in the neo-Renaissance style, in connection with which, however, use has been freely made of Classical details. With a frontage of

30 feet to Princes Street, the building, 80 feet in height, is divided into four principal floors. The walls are of sandstone ashlar, except the whole of the shop front, which has been faced with polished red Correnie granite. The feature here is a segmented arch which encloses a central doorway and two large windows, one on each side. The door is deeply recessed and its oak woodwork is carved in a light French style. The four windows on the first, or tea-room, floor are of the French casement order. They are set in a massive arcading, each opening separated from its neighbour by a three-quarter column, with an Ionic capital treated in a modern spirit; while the pediments have large key blocks with trusses for supports at the sides. Over this is an architrave, with dentil moulding. The four windows on the second floor, which light the smoking-room, are of a plainer character, being divided by simple, angle pilasters, breaking into the square at the base with carved stops. Higher is a plain frieze over which are the grill-room windows on the third floor. The divisions between them are pronouncedly treated with rusticated blocks, which give a feeling of strength to them as supports to the main cornice. This is of a plain character with modillion blocks. Above this rises an ornamental gable top having a circular window, supporting a carved niche with side pillars and overhead a broken pediment. In front of the circular window is a wrought-iron balcony grill. The building is, so to speak, framed on its east and west sides by octagonal pilasters, which, rising above the whole of the floors, are finished atop with carved pinnacles. Two coloured shields of Royal patrons of the establishment affixed on each side bind the granite and ashlar masonry together, and the ornamentation being all bold and the windows considerably recessed a fine play of light and shade takes place over the building under the influence of the afternoon sun. The constructive parts of the building are of steel. It was found that the old gables, riddled as they were with flues, were not fit to carry the weight it was intended to put upon them. Heavy steel uprights were accordingly brought into use, and all the floors, which are fireproof, are also carried on beams of the same material. The foundations were dug into a soft, crumbly shale, which at a suitable depth was ultimately covered with a thick layer of concrete. No fewer than six springs of water were tapped, but the difficulties connected with their flow were ultimately overcome. The building is L-shaped, the other front being to South Charlotte Street, where the elevation is substantially the same as that of Princes Street, though the frontage is 5 feet less in width. In the angle of the L there is a large dome with lantern, the opening to which is 25 feet from the floor. The lower panels of the dome, which is 28 feet across, are beautifully decorated with the signs of the Zodiac, the figures being in low relief. The whole of the decorations of the shop are in stencilled ornament, gold and light colours being freely used with pleasing effect. The tea-room above, 50 feet by 25 feet by 14 feet in height, is an elegant hall, panelled in fine Scottish plasterwork, and having for *pièce de résistance* a large "plafond" or ceiling painting, executed by a French artist, the subject of which is Queen Mab in her fairy chariot with attendants. Oval in form, the picture, executed in soft colours, with great breadth, is framed by a rich gold moulded band with flowers and fruit in high relief. The smoking-room is panelled in dark oak, and has for special feature an old English fireplace with inglenook, the opening of the hood of which is 14 feet across by 7 feet in height. The grill-room above is fitted up to resemble an old English kitchen. It, too, is panelled in dark oak. The ceiling shows exposed joists with white plasterwork between, and the windows are filled with leaded glass of novel designs. In the overmantels (over two fireplaces) are racks with old pewter, which is at present all the "rage." The kitchen is on the top floor. The whole of the Princes Street side of the building is devoted to the public; the Charlotte Street half and the basement are fitted up with the most modern appliances for the manufacture of lighter articles in the bakery and confectionery business of the firm. The power is supplied by electricity, and it is by electric lamps that the building throughout is artificially lighted. An unusual amount of thought and care has been devoted to the heating and ventilation arrangements. The system of ventilation adopted is that of pumping in pure air under pressure into each room, and there are elaborate means for washing, heating in winter and cooling in summer, the air before it is sent on its way to the different floors along a series of large metal tubes which have been skilfully masked. The principle on which the Otis electric service lifts work is also of a somewhat novel character, the cage being raised or lowered automatically to any floor from basement to ceiling by the touching of a numbered button on an indicator outside the shaft at the different stages. There is also, of course, a lift for visitors.

The Postmaster-General has appointed Mr. J. Gavey to be engineer-in-chief of the Post Office, on the approaching retirement of Mr. J. Hookey.

## NOTES AND COMMENTS.

It is not creditable to find local authorities in America endeavouring to deprive an architect of his legitimate fees on the supposition that an increase in the size of buildings does not add to the architect's labours. The Commissioners of Jasper County, Indiana, gave instructions to Mr. C. R. WEATHERHOGG, Indianapolis, to prepare plans for a court-house at Rensselaer which was to cost 100,000 dols. He was to be paid 3 per cent. commission for the plans and 2 per cent. for superintendence on the cost of the completed building. It was arranged, moreover, that alterations were to be made and new plans furnished if required, or if the tenders exceeded the stipulated sum. Various changes were made by the Commissioners, and eventually the cost of the building was nearly 150,000 dols. The Commissioners declined to pay fees on that sum, maintaining that the architect was simply to have his fees charged on a basis of 100,000 dols. The Supreme Court of Indiana took a different view of the agreement, and decided that the architect was entitled to receive 5 per cent. on the actual cost of the building. It would be peculiarly inequitable if a court of justice should be an enduring memorial of unfairness to the designer.

THE second part of Mr. H. INIGO TRIGGS's work on "Formal Gardens in England and Scotland" (B. T. BATSFORD) has appeared. The first subject is Wilton House, and the sunken garden is presented in which architectural forms and sculpture are introduced. It is no wonder that so many visitors to the house prefer looking out of the windows towards the grounds instead of devoting their attention to the sculpture and paintings. The garden and maze at Hatfield House depend mainly on the geometrical character of the beds, for no statues and vases are visible. Drayton House, Northants, possesses gardens in which the aim evidently was to suggest spaciousness as well as beauty. The entrance-gates are a fine composition and the leaden vases are proofs of the skill which was attained in working with that material. There are several plates of Hampton Court. Views and plans are also given of Trentham Hall, Livens Hall, Ashridge Park, Buckingham House, Fordel House, Balcarres, Barncluth, Newbattle Abbey, Kinross House, which has remarkably quaint cornucopia arranged as a coping to the wall; Drumlanrig Castle, Earls Hall, Drummond Castle, Summerhouses, Claverton House, Ven House, Bulwick Park and Hadsoe. There are, in addition, examples of gates, sundials and topiary work. The interest of the first part is well sustained, and the execution of the measured drawings, sketches and photographic plates is no less perfect.

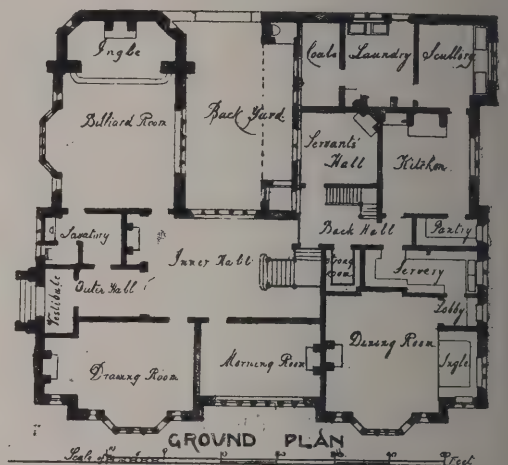

IN the *Baltimore Architects and Builders' Journal* Mr. J. APPLETON WILSON records some of the impressions he received in London. He was more satisfied with all he saw than the majority of tourists; and his remarks will suggest some of the differences between the Metropolis and American cities. He says:—The residence portion, as at South Kensington, is generally well paved. The footways are always of stone or concrete, with curbing about 1 foot thick. The driveway is generally of blocks of creosoted Australian red wood, laid over a heavy bed of cement concrete. This is left with a perfectly true surface and the blocks placed on it with a grout of cement, or a binder of hot pitch between them. The surface of the pavement is covered with fine gravel and coarse sand occasionally, to prevent horses from slipping. This is kept in iron boxes at the curb. The blocks stand well, and are easily repaired when worn, as the foundation is never disturbed. All wires, pipes, &c., are either under the footways, or if under the street, are accessible every few feet, through covered manholes. The houses are generally without vestibules, but have handsome street doors—usually painted black, Tuscan red or apple green—with brilliant gloss. The bells, knockers and plates are of polished brass. All houses have wide areas, protected in many cases by handsome wrought-ironwork. The kitchen and servants' rooms are always below ground, opening on the area, the ground floor being only a few steps above the pavement. As each room has a fireplace the result is seen

in the immense chimney-stacks on the party walls. It is not unusual to see them with twenty-four flues. The better class of houses have five storeys above ground, and the uniformity of the architecture gives breadth and dignity to the streets. Portland cement is largely used for window and door enrichment, balconies, porticoes, balustrades, &c. and wears admirably. The colour of the London brick is a mottled yellow. After a few years it becomes toned down by smoke and exposure, giving not an unpleasant effect to the mass.

## ILLUSTRATIONS.

MANSION AT BAILDON, YORKS: SOUTH-WEST ELEVATION. SOUTH ELEVATION. DRAWING-ROOM. DINING-ROOM. MORNING-ROOM. BILLIARD-ROOM. HALL.

THE external walling is faced with local sandstone in irregular courses; the roof is covered with stone slates. The woodwork, where not painted, is of fumed oak left unpolished. The hall and billiard-room are lined above oak dado with red sandstone. The dining-room is panelled with oak, and walls covered with red canvas. In the drawing-room the woodwork is white, and walls covered

with yellow canvas. The woodwork of the morning-room is mahogany, and the walls are lined with green silk. The glazing is mostly in plain leaded squares; Norman glass is used in coloured windows. The heating is by low-pressure American radiators, and the electric lighting throughout from house dynamo.

The general contractors were Messrs. W. Ives & Co., of Shipley, the architects being Messrs. ADKIN & HILL.

CATHEDRAL SERIES.—RIPON: THE SOUTH NAVE AISLE. LOOKING EAST

## RIPON CATHEDRAL.

In the early part of the last century little attention was given to the history of the English cathedrals. It was therefore considered an onerous task when Dean Waddilove undertook to examine the archives of Ripon Cathedral which were in his custody. It would have been easy for him to make a large use out of the information, but he preferred to restrict himself to the following essay, which contains all that can be gathered from the documentary evidence about the history of the cathedral:—

The church of Ripon partakes of the common origin of others in this kingdom, being founded at the re-establishment of Christianity after the conversion of the pagans. Alfred, king of Northumberland, first established a monastery or college of monks at Ripon, from Lindisfarne and Hexham, in the year 661.

At this period the controversy concerning the time of the celebration of Easter took place, and to decide it a synod was held before the king at Strenshal, now Whitby. Here Wilfrid appeared as the champion of the Church of Rome. His eloquence prevailed; the Roman ritual was confirmed, and the British monks retiring from their monastery at Ripon, Wilfrid was appointed to preside in it, A.D. 663, and soon afterwards raised to the see of York. All the ideas of this prelate were magnificent for the age in which he lived, and it is to be regretted that we have no perfect instance of his skill in architecture yet remaining, unless the church at Ely, or that at Derbyshire, be of his construction.

He built very splendidly, according to his time, the church at Ripon, "with curious arches, fine pavements and winding staircases," as William of Malmesbury describes it. It is allowed, however, that it had ceased to exist in the time of that writer, and was probably not extensive in comparison with the structures in later ages. But the similar descriptions of the church at Hexham, another production of Wilfrid's genius, by writers as late as its existence, Eddius and the Prior of Hexham, leave no ground to doubt of its being an edifice of considerable importance. This structure at Ripon probably sunk in the interval between the Danes and Saxons long before the Conquest. It is found in the year 860, or rather 866, the town, with part of the monastery, was destroyed by the Danes, and A.D. 948 the king Edred retaliated on them, and laid waste the Northumbrian territories, when the monastery and again town perished in a general conflagration. In the course of two years the town was rebuilt, or restored, by the care of Odo, bishop of Canterbury, who removed the bones of Wilfrid to his own cathedral in Kent.

The devastation of the northern counties by the Norman conqueror was also fatal to Ripon. "Omnis hæc terra vasta" was the return of the Domesday Book on the territories of the church. But there are grounds to conjecture that it did not remain in that state.

The church and manor of Ripon from the time of Wilfrid, at least from that of the Saxon Athelstan, had belonged to the king of York. Thus in Domesday, "Hoc manerium tenuit archiepiscopus nunc Thomas archiepiscopus." And Thomas, the chaplain of the Norman king, and archbishop of York, and who assisted himself in restoring his see, died at Ripon. It cannot be supposed that the church, or the demesnes, would be then allowed to lay waste. Henry I. also granted a charter for a free town. This implies some degree of population, and is also to the era of the present edifice.

In the reign of his successor, King Stephen, A.D. 1140, the present structure of the cathedral of Ripon, however since enlarged and improved, was raised by the munificence of Thurstan, archbishop of York, and the first patron of the new Abbey. The whole of the west front, including its towers, the middle tower and the transept, with a part of the aisles, remain of his work. These remains are amply sufficient to furnish a clear idea of the plan and construction of the first very singular Anglo-Norman church. The time of the construction of it was precisely the era when the narrow sharp-pointed Gothic arch first began to take the place of the circular one, and they are both seen in a perfection scarcely attained elsewhere in the kingdom.

The general plan consisted of a west front, with narrow windows, supported by two handsome towers, and an opening into a broad nave without side aisles, leading to four circular arches which supported the middle tower, and forming a choir, not perhaps of greater extent than the rest of the transept.

However much the church has gained in size and ornament by subsequent alterations, a transient regret cannot but arise in the mind that so complete a specimen of the architecture of the age had not remained to posterity.

The west front is uniform and stately. Its breadth is 43 feet, including the towers of 29½ feet each, is in the whole the external measure. It rises in the point in which the transept terminates to a height of more than 100 feet and in the towers to 110 feet, whilst they were evidently surmounted by

wooden spires, covered with lead, since removed, of at least an equal elevation. The three doors of this front, of a deep recess, and flanked with many small pillars, open into the nave. Above them are two rows of five windows, of a good height and proportion, and all the windows and ornaments attached to the towers are in a corresponding style of building. The towers themselves stand in a continued line with the front, and compose a part of it; but have had three outward sides, and only communicated with the church in their interior side, and in a line which made a part of the walls of the nave. The west towers of the old cathedral of Ely had an opening to the church in a similar manner.

In the inside of the nave it is plain that this front composes what is usually called the great west window, filling a space of 57 feet by 41 feet; and the size and number of these collected lancet-shaped windows are so ample that the effect of light gained to the church is very considerable. There is also a degree of elegance in the construction of the architecture, which appearance is gained by the row of long, slender columns that surround each of these lancet-shaped windows in the inside, in a similar manner with those of the external front, and which, accompanying them in their whole length, compose the inner west front towards the nave. It has been observed by writers on ancient architecture that on the introduction of the sharp-pointed arch an immediate change took place from ponderous Saxon columns to the most minute small ones; sometimes in clusters, occasionally as separate and distinct, frequently, as here, in two slightly attached columns, with which also the door-cases, having arches of singular flatness, are supported. The whole effect is very favourable to the lightness of the building.

The walls of the first nave are gone, but its height may be known by the stone angular ledge for supporting the roof, yet remaining, with a portion of lead in it, on the side of the middle tower, compared with that of the point or apex of the west front. The measurement of these angles determined the shape or fall of the roof, and consequently the height of the walls.

The ridge of this roof much exceeded the height of the present one, and must have been nearly 100 feet, if not more, from the pavement. The walls probably not less than 80 feet, and this corresponds with the square of the west front under the pediment between the west towers.

The windows in the side walls of this nave were, it may be presumed, either narrow with a circular top, as those of Fontaineaux and other abbeys of that age, or, more probably, lancet-shaped, to correspond with those in the adjoining towers. Examples of each kind now exist in the transept of the minster.

The east end of the nave or body is bounded by the middle tower, of the same height but larger in width than those of the west end, and then supporting a leaden spire of the height of 120 feet. The tower was raised on four circular or Saxon arches of such amplitude, lightness and beauty as fully to vindicate the Anglo-Norman artists from the inability to execute works of just and elegant proportions. Two of these now remain. And the antiquary, accustomed to contemplate the massive pillars and heavy arcades of the Saxon or Norman churches, views with wonder and delight a lofty arch of great expansion and delicate workmanship. These arches are 22 feet in span, 33 feet high to the crown of the arch, on a column of 26 feet, and are formed with a slight moulding of not more than 5 feet in thickness.

The two, north and south, ends of the transept are in the usual style of the age, with narrow windows, plain, and no ways remarkable.

The extent of the old choir is sufficiently ascertained. All the choirs of the Norman churches were remarkably short. And this is a strong instance of it, it being about the length of 42 feet. The walls and windows of its narrow side aisles correspond with those of the transept. The side arches of this ancient choir have been altered to a Gothic shape, but the upper windows above them on the north side yet remain. The original form of these arches may be supposed to have been circular, and if in a style corresponding to the large one adjoining to them under the middle tower must have exhibited a very handsome appearance. The east end of this first choir can only be conjectured; yet most probably it had much consonance with the opposite windows of the west end of the church. And a very reasonable idea may therefore be obtained of it by supposing it to resemble the end of the choir in the abbey of Rievaulx, with two rows of three large lancet-shaped windows, and probably a smaller one like that of the west front of Ripon, in the angular top of the building. Such was the edifice built by Archbishop Thurstan in the middle of the twelfth century.

The alterations that have since taken place have converted the internal appearance into that of a Gothic structure of just and noble proportions; whilst select parts of the first church are yet retained sufficient to render it one of the best specimens of the Anglo-Norman style to an antiquary.

These alterations were made way for by a destructive con-

flagration on an invasion of the Scots, A.D. 1317, in the reign of Edward II., when the church was, as it were, totally consumed. But there existed another general cause, which was constantly producing effects beneficial to the church of Ripon. The archbishops of York had a palace at Ripon, and appear to have paid great attention to the fabric of the church as accidental injury or varying taste demanded any change or renovation. Hence wealth would not be wanting, and the architects who raised or improved their magnificent cathedral were at hand to furnish similar plans of improvement at Ripon.

Fortunately for this fabric Archbishop Melton held the see of York when the town and church of Ripon were destroyed by the Scots. And on the accession of Edward III., as soon probably as a more stable government gave any prospect of security to the northern parts of the kingdom, he promoted the rebuilding of the town and caused the church to be re-edified, as it is expressed, from the foundations.

The devastation caused by the fire was probably the guide to the new erections. It may be deemed certain that the whole of the roof and spires was consumed. It is far from improbable that the walls of the nave were also damaged beyond the hope of restoration. This would occasion their removal. At the same time the whole west front remained, and pointed out the breadth of the new side aisles by the breadth of the towers now to be included in them.

Archbishop Melton was then employed in completing the west end of the church at York on the plan of his predecessor, John de Romaine; and the breadth of the aisles, the style of the Gothic arches of the nave, with the lofty range of windows which surmount them at Ripon, exhibit great similarity to the corresponding parts in that cathedral.

How far the two large Norman arches, under the middle tower, now removed, were impaired by the fire cannot be ascertained; but they are replaced with great ingenuity, for the Saxon arch was removed and the pointed one inserted without disturbing the upper part of the wall of the tower by two Gothic arches in the style of those of the nave, yet somewhat heavy and ponderous, with much irregularity in the general appearance, and do not entirely compensate for the absence of the Saxon.

At the same time these two sides of the middle tower, perhaps also injured by fire, were new cased with stonework, and their windows in the lantern altered to the Gothic. It is apparent, from the unfinished state of the stonework, and from the columns of these Gothic arches, that an intention prevailed of rendering the whole uniform by the alteration of the other sides of the tower; but whether this change was made by Archbishop Melton and succeeded the conflagration, or took place under the idea of rendering the great arches similar to those of York at a future period, is uncertain.

In the choir a date of A.D. 1331, the same year in which this archbishop gave regulations to the canons of the church, makes it evident that he had a principal share in improving and enlarging it. He extended it eastward to twice its former length, so that it is now of the extent of 99 feet. He also probably altered the arches of the old choir and added the new ones.

The other alterations in the choir it is difficult to assign to any particular era. There is a date on the woodwork so low as A.D. 1494. The notices to be obtained from the style of the architecture are very dubious. It was once obvious from a negligent junction of the old and new work at the third side arch, and from a step across the choir, that it was considerably lengthened.

At the present day the east end is adorned by a window of ample size and great beauty. In its pristine state and full extent its dimensions were 51 feet by 25 feet. It is very similar in design to those of the chapter-house at York, probably subsequent to the renovation of the church in the time of Edward III., but yet of the same design or pattern of the side windows adjoining to it. For there yet remain in the window two shields in painted glass, with the arms of England and of France, in which those of France are given with *fleurs de lys semé*, and not restricted to three *fleurs*, as took place in the time of Henry V. This fixes the date of the window to the fourteenth century, or between 1 Edward III., A.D. 1326, and the time of Henry V., A.D. 1413.

Out of gratitude towards their founder, King James I., the dean and chapter had his arms placed in the centre of this window. The splendid colours of the glass add a richness to the appearance of the choir.

The rich ornaments of the stone screen at the entrance of the choir, and the carved woodwork which ornaments the stalls of the interior part of it, seem also to claim particular notice, as the last is allowed to exhibit a delicacy and lightness superior even to that of York, or of almost any other religious edifice possessing similar decorations.

Another advantageous distinction of the church of Ripon is the excellent proportion of the body of the fabric, the breadth of the nave and side aisles being 87 feet, which exceeds that of

every Gothic church, collegiate and cathedral, in the king except those of York, Westminster and St. Albans. A length of the nave is not considerable, being about 134 and the height very ample, of above 80 feet, the whole presents an edifice more nearly approaching the just rules of architecture than perhaps any other structure of its kind in the Middle Ages.

The exterior of the church is in itself lofty and well proportioned. But the towers, like all those which have been found to support leaden spires of great altitude, are flat and give in part that appearance to the whole building.

## THE PROPOSED HORTICULTURAL HALL

IT seems an extraordinary fact, writes a correspondent of the *Times*, that, large as is the capital invested in the country in the various trades generically grouped under the title of horticulture, there is no really corporate centre. The Royal Horticultural Society which has done, and which continues to do so much for the trade, hides itself in a characterless rooms in a large building in Victoria Street; fortnightly floral exhibitions are held in a drill hall in the street of Westminster; whilst the Horticultural Club, which is almost exclusively composed of members of the Society, has its quarters elsewhere. The rent of the two first-mentioned places amount to over 300*l*. Of the drill hall, where the exhibitions are held, it may be said that it possesses every possible advantage—except size—for flower shows, with the result that the general rule its visitors include very few of the general public apart from those immediately or remotely associated with horticultural pursuits.

For many years some of the more spirited members of the Society have been agitating for a central hall which should include under one roof the offices and library of the Society, an exhibition hall for all purposes. Some years ago an organised attempt was made, but the scheme after attaining considerable proportions was, for some reason or other, which it is not now necessary to enter, dropped like the verbal hot potato. Another scheme has been formed within the last few weeks, and promises to be a success.

When the committee appointed by the Society were in position to take a practical step, five different sites were inspected. Among these were (1) the spot known as Nine Elms, which covers about an acre of land, for the freehold of the sum of 100,000*l*. was asked, whilst another 10,000*l*. would be required to convert the place into a suitable home for the Society; (2) a site in Buckingham Palace Road, covering about 15,190 square feet, at a rent of 700*l*., coupled with an obligation to expend at least 20,000*l*. on buildings and a lease of eighty years' duration only; (3) a site bounded by Vincent Square, Bridge Road, Francis Street, and Carlisle Place, including a fine building known as the old Cardinal's house; (4) a site in Francis Street, covering 15,000 square feet, at a rental of 1,000*l*. for a long lease; and (5) a site in Vincent Square, at the corner of Bell Street, with an area of 17,565 square feet at a rent of 690*l*. a year for 999 years. For various reasons the first four sites were abandoned and the last one committed itself to the committee, who recommended its adoption. Ecclesiastical Commissioners are the owners of the land, and they stipulate that a sum of not less than 15,000*l*. should be spent on a building and offices.

All things considered, the site selected is perhaps the best of the five which the committee had under consideration—the cheapest, at all events. It is difficult to understand, however, why the members of the committee confined their choice to Westminster, which is not by any means the most convenient position in London. Horseferry Road, one of the entrances to Vincent Square, is not a savoury thoroughfare, and Vincent Square itself is scarcely a fashionable quarter. Why have the headquarters of a most important industry in an obscure street in Westminster? Are there no available spaces to be considered on the way of the new thoroughfare between Horseferry Road and the Strand?

The committee who have decided upon the spot included is true, some of the most honoured and experienced names in horticulture, amateur and professional—Sir Henry Schomburgk, Sir Trevor Lawrence, Mr. H. J. Keitch, Dr. Maxwell Masters, F.R.S., and Mr. Sherwood—and their influence of opinion in the matter cannot be improved upon. Still, the interests of the general public a better position might have been selected. The Horticultural Hall, to fulfil its functions, should be international rather than national. The Lindley Library, one of the finest semi-public collections of horticultural and botanical books in existence, is in the custody of the Society. Since it was started, a century ago, the Society has done a vast amount of good work; it has had its ups and downs, like many other excellent institutions, but the success which has been vouchsafed it during the last few years should only be maintained and improved upon so long as it is managed on strictly business principles.

The Society has ratified and adopted the recommendations of the committee, and it only now remains for it to obtain by subscription the 25,000*l.* necessary before building can begin. One-third of this has been obtained before any appeal has been made—Sir Henry Schröder has promised 10,000*l.*, whilst Mr. Sherwood, Mr. Elwes and Mr. Sutton have promised 1,000*l.* The Society has an astonishingly long list of members, no fewer than 900 joining last year. Although the scheme selected is not an ideal one in any way, yet perhaps in the long march of improvement may overtake even the West-End slums and transform the unlovely neighbourhood of Coventry Square into a pleasant and healthy part of London. The erection of the Horticultural Hall will at least contribute something towards that highly desirable end.

## SHAKESPEARE MEMORIAL THEATRE.

A LETTER has been addressed to the *Times* by Mr. T. Fairman Ordish, F.S.A., chairman, executive committee, of the Topographical Society, and the author of books on the Elizabethan theatres, on the subject of a Shakespeare Memorial Theatre, in the form of one of the old playhouses. He says:—

When the scheme for the new thoroughfare from Holborn to the Strand was made known, the idea of a memorial to Shakespeare within the area marked for clearance may have occurred to many; but whether the idea resulted in any movement other than that with which I am acquainted I do not know. A committee was formed, a petition to the London City Council was drafted, printed and signed by the members of the committee and various people of eminence were found to approve of the proposal. Then came the war in South Africa, and in the period of stress and anxiety ensued it was agreed that the movement should be postponed. Happily the time has now arrived when the note of discord which rings in the patriotic plays of Shakespeare does not suggest a discord with the nation's mood and fortunes; the opportunity of celebrating in the capital of the Empire the most intellectual force of the English-speaking peoples has been issued away, and those who were concerned in its inception desire to test the possibility of realising this memorial as a symbol of that unity which has so gloriously appeared in the history of the nation through which we have passed.

The personality of Shakespeare is obscure, but the appeal of his plays is vivid and real. It is not proposed to add to the statues of the poet which already exist; the idea of a proposed memorial is an objective presentment of the conditions in which the plays were born. The terms might be suggested by saying the conditions which begot the plays. The Elizabethan playhouse was distinctively an English institution. Foreign visitors to this country regarded these playhouses as the most distinctly novel feature of London at the time. On every hand they beheld dismantled religious buildings, and within the ruins of some which skirted the city they found these playhouses had been erected, as at Blackfriars, at Blackfriars, and at Holywell, Shoreditch. On the inside they saw playhouses built in the open, the foundations of which had been determined by national tradition, and elsewhere shown. Instead of the priests and friars which they were accustomed, these visitors found the playhouses were bands of actors trained to a high standard of acting. They beheld the London populace flocking eagerly to the playhouses, as to the lecture-halls of a great university, and they listened eagerly to the music of their newly introduced language, where plays were presented of such range and power that they became the best popular school of *humaniores* ever devised. No wonder that visitors to London in which Shakespeare lived and worked made notes of these novel buildings, in which the highest and the lowest, through which the life, the ideals and the inspirations of the time found expression. To such a representation of the representation of the interior of an Elizabethan playhouse—that of the Swan—discovered a few years ago. Now take the views of London drawn and viewed at that period, and what do we see? The pictures drawn in perspective from the south, and the playhouses on the Surrey side are in the foreground, the most conspicuous in view—the Swan, just referred to, the Hope, which conducted in part or alternate connection with the sport of baiting, and the Globe, so intimately associated with the plays of Shakespeare. An earlier playhouse in the same neighbourhood, the Rose, is depicted in the map of John Norden, 1593. In a topographical work of the time there is a plan of the first Globe playhouse, which had been burnt down when the riverside views were drawn.

Now the suggestion is that on a site in the area to be cleared for the new thoroughfare into the Strand a reproduction of one of these playhouses should be erected as a memorial to the Elizabethan poet who gave his countrymen for all time a body of wit and wisdom, that vehicle of universal culture,

which we know as "Shakespeare's Plays." Beyond the graphic representations alluded to above, we possess records full of particulars and details relating to the construction of some of the playhouses. Indeed, the data for the erection of such a building are ample. Here, we may say, is something distinctively national, a purely English invention or product, which would be an object of interest throughout the British Empire. It is proposed to appeal to the London County Council to grant a site for the realisation of this patriotic idea, which shall exist as a visible sign not gorgeous or ornate, but picturesque, simple and effective, to show that the poet is not without honour at the centre of the Empire. Surely it is fitting that he should be celebrated in the place where his influence and inspiration were originally imparted in a building such as this on a stage like unto that which this building will contain by means essentially national, of which such a building was the ultimate cognisable expression and result.

The suggestion here made as to the site arises from what is regarded as a good opportunity, but is not vital to the scheme itself. In the printed petition it was pointed out that Battersea Park offers a parallel to Paris Garden and Bankside, which would realise more completely the surroundings of the Surrey-side playhouses in Elizabethan times.

In connection with the suggestion as to the new thoroughfare along the west side of Lincoln's Inn Fields there is a point reserved for future consideration, viz. the possibility of erecting in the neighbourhood of the proposed playhouse some Tudor houses on the model of the ancient London street which proved so attractive at one of the exhibitions at South Kensington some years ago. The work then accomplished by Mr. Birch is in itself a lesson and an incentive which may bear fruit when the present scheme comes to be worked out. These houses would, of course, be lettable for business purposes, and for a certain class of shops would command high rentals. Such surroundings would obviously increase the value of the object-lesson which it is the design of the memorial to furnish.

It may be pointed out that the proposed playhouse building itself would be available for various uses—as a County Council museum of London antiquities, especially of relics and memorials of the Elizabethan period; lectures and meetings; above all, the representation of plays as they were produced and acted in Shakespeare's time. Uses such as these suggest revenue, and indeed there is reason to think that the memorial would be largely self-supporting.

The present year will in all human probability be remarkable for the number of visitors from the colonies and from America. What an attraction, what a source of interest such a building would be to them if it were in existence. Looking to the future, when it is hoped that London will witness representatives from the Britains over seas in session here on Imperial matters, and when the circulation of British blood through the heart of the Empire from all its limbs shall be a constant current, it is felt by those who framed the petition that it is incumbent upon them to seek the most effective means to place the proposal for a Shakespeare memorial in London before the British public. It is hoped that St. George's Day next, April 23, the anniversary of Shakespeare, may not pass without some public recognition in London, and that in the near future we may witness adequate Shakespeare commemorations within the suggested memorial building. In the meantime I shall be happy to receive the names and addresses of London ratepayers who desire to sign the petition, and also of those who would be disposed to assist on a committee.

## THE ENCLOSURE OF STONEHENGE.

ON Wednesday in last week an inquiry was held in the Council Chamber, Salisbury, by the Hon. Percy Wyndham, the Marquis of Bath and Mr. J. M. F. Fuller, M.P., on behalf of the Wilts County Council, into the enclosure of Stonehenge and the alleged obstruction of public rights of way leading thereto. Mr. Birkett represented the petitioners, the Amesbury Rural District Council; Mr. G. J. Shaw Lefevre appeared on behalf of the Commons and Footpaths Society, the National Trust Fund, the Kyrle Society, and a number of scientific gentlemen who sent a petition to the county council asking them to vindicate the rights of the public in respect to Stonehenge; and Mr. J. Hammond appeared for the owner of Stonehenge, Sir Edmund Antrobus.

Mr. Birkett called a number of witnesses, who stated that from time immemorial the tracks across the downs leading to Stonehenge, which had been obstructed by the wire fence erected by Sir Edmund Antrobus, had been used by the public without interruption of any kind.

Mr. Shaw Lefevre said he visited Stonehenge over the tracks described more than fifty years ago, and he did not think anybody could look at the tracks without seeing that they had been used from time immemorial. On the part of the societies he represented he disclaimed any hostility to Sir

Edmund Antrobus, who he thought had been actuated in what he had done by public motives. He was apparently advised that it was necessary to protect Stonehenge for two reasons. In the first place, it was feared that the sale to the Government of land in the vicinity of Stonehenge would introduce a number of bad characters into the district and that the stones might be damaged; in the second place, it was thought necessary to effect certain improvements and to replace certain stones in their original position. And, to give further protection, a barbed-wire fence was erected around the stones. These things cost Sir Edmund Antrobus considerable expense, and it was to recoup himself that he charged 1s. per head for admission to the stones. Two evils had resulted from his action. The erection of the fence was unsightly, and it had altered the character of the monument and destroyed much of its charm and beauty. The erection of the fence had also interfered with rights of way which had been enjoyed by the public from time immemorial. In his opinion, if Sir Edmund Antrobus was anxious to preserve the monument, he should have placed it under the Ancient Monuments Act. He would have remained the owner still, and the cost of protecting and preserving the monument would have been borne by the State. He ventured to say that Sir Edmund should be reimbursed for the expense he had been put to, on the understanding that the monument was to be placed under the protection of the Act he had referred to.

Mr. Hammond pointed out that for many years Sir Edmund Antrobus and his father before him had employed a custodian to look after Stonehenge, and showed that they had always been regarded as the owners of the stones. It was true that the public had used tracks over the downs to reach Stonehenge, but it was by Sir Edmund's permission that it was done and not as a public right.

The committee of inquiry will in due course report to the county council.

### THE VICTORIA MEMORIAL HALL, CALCUTTA.

THE following is the official Note which Lord Curzon has prepared on the Victoria Memorial:—A year having now elapsed since the melancholy event which gave occasion for the foundation of the Queen Victoria All-India Memorial Fund, with the object of creating a great memorial hall in Calcutta to be perpetually associated with the late Queen's name, a fitting opportunity presents itself for offering to the general committee and to the public some account of the steps that have already been taken, and of the stage that has now been reached in the prosecution of this undertaking. The appeal a year ago was addressed to the whole of India, and it is from the whole of India that the response has come. A sum of over Rs. 38 lakhs, calculated upon the assumption of a one lakh limit to individual subscriptions, has been promised, and of this total over Rs. 20 lakhs have already been paid in. Considerable additional contributions are still anticipated. Inasmuch as the collection of these funds was necessarily centred in one place, a provisional committee was appointed in Calcutta in January 1901, to receive the general contributions of the entire country, and to conduct the particular collection in Bengal. This committee, under the successive chairmanship of Sir P. Playfair and Mr. M. C. Turner, has been most successfully and energetically pursued, and is now approaching the termination of its labours. There still remain large numbers of outlying subscriptions to be collected, and communications are in course of being addressed to the various provincial committees as to the proportion of their funds which it has been decided to hand over to the All-India Memorial. When these objects have been attained, there will be no occasion to make a further demand upon services of the provisional committee, which will be dissolved. A small and strong executive committee will require to be appointed to conduct the future proceedings in connection with the Victoria Memorial Hall. We are now passing from the stage of collections to that of plans, designs and buildings, and the principal work that lies before us is about to begin. I propose to constitute this executive or building committee without delay.

In the meantime I will here give an outline of the point to which matters have progressed, and of the work that now lies before us. The general public, from whom we have derived so much of our support, will desire to know something of the manner in which it is proposed to utilise their contributions. From the discussion which took place a year ago, the following decisions emerged:—That the building in memory of the late Queen-Emress should take the form of a memorial hall, which should be primarily commemorative of herself, but should also recall the famous persons and events of Indian history, and that it should be erected upon the Maidan at Calcutta. During the year that has since elapsed anxious attention has been given to the following points:—(1) The style in which the building should be erected, (2) the material of which it

should be composed, (3) the exact site on which it should be placed, and (4) the best method of procuring suitable material. Upon each of these points I will say a few words.

#### *The Style of Architecture.*

1. The question of style has been examined in both to the objects of the building and to the nature of its surroundings. At first sight it might be thought that a building erected with Indian money on Indian soil should be in Indian style, but there is no distinctively Indian style. There are the various styles that have been connected with the periods of Indian religious or monumental art, Brahminical, Jain or later Hindu; there are also the Mohammedan, Saracenic and so-called Hindu-Saracenic styles. None of them, however, is indigenous to Calcutta, and none is suited to the purposes of a gallery or museum. If the style of architecture were adopted we should challenge comparison with the masterpieces of the past and invite certain criticism. There could be no greater rashness than to attempt a new style. None of the other styles admit of the large, spacious, lighted halls that are required for the display of sculptures, paintings, or trophies of whatsoever description.

It results from this examination that the only style indisputably suited to the object is the Classical style (which may be termed Greek, Italian, or Palladian), in which the building has been built every, or as nearly as possible every, art and museum in the world, a consensus of opinion that cannot be attributed to mere accident, but is admittedly due to unequalled merits and capacities of the style. In the case of Calcutta building, there is greater reason for such a choice than the fact that the style recommended is that in which 90 per cent of the larger buildings of Calcutta have already been constructed. It would be a dangerous experiment to plan a building on the Calcutta Maidan any great fabric that was completely out of harmony with the whole of its surroundings. Their style is not particularly good, but such as it is, it is uniform. If an Italian style, and there can, I think, be little doubt that the safest plan will be to erect a building which will not be spoiled by their neighbourhood nor make them look ridiculous.

#### *The Material.*

2. In one of my speeches last year I indicated that the material of the hall should, in all probability, be a pure white marble. This is recommended on the grounds of its purity and beauty, because of its peculiar suitability to the surroundings of a great park and garden, and because a surface, capable of receiving a polish, is more likely to resist the influences of a moist climate than ordinary stone. The choice then indicated appears to have been universally approved by public opinion, and there will probably be few to dissent from it.

An examination has been made of the leading quarries of white marble which are to be found in the States. Their capacity is no longer what it was in the past when they are alleged to have provided the material for the Taj and the pearl mosques of Agra and Delhi. It does not appear to be likely that slabs of any great size could be procured from them. There is a good deal of streaking and colouration in the modern marble, and a continuous wall-surface of uniform tint and texture could not easily be obtained. The greatest obstacle to the employment of Indian marble on a very extensive scale is the cost of land transport by rail to Calcutta. This is absolutely prohibitive. I may give an illustration. When I was ordering the white marble for the reduction of the Holwell Monument, which I am about to erect at the corner of Dalhousie Square, I procured estimates from the Rajputana quarries and from Europe. I found that an Indian firm, procuring the marble from Rajputana, could only land the completed monument in Calcutta at a cost of half as great again as the same article could be quarried, chiselled and shipped from Italy and deposited on the Calcutta wharves. When we come to deal with the enormous quantities of marble that will be required for the Victoria Hall, at a far from excessive sum of money at our disposal, the question of cost becomes a serious consideration. Nevertheless, although the bulk of our marble may have to be imported from abroad, I think that, as far as possible, we should make use of local material, and I am prepared to employ the Jeypore or Jodhpore or other marbles to the fullest degree compatible with the capacity of the quarries, qualified always by the consideration of expense.

Among foreign marbles to which we may have recourse have compared specimens of Greek and Italian marbles. The latter from the Carrara, Sicilian and other quarries are well known. The most famous Greek marbles were the Parian and Pentelican. The marble of which the Parthenon was built is still hewn from the slopes of Pentelicus at a distance of about 10 miles from Athens. The Parthenon is unquestionably the most beautiful white marble edifice in the world, always excepting the Taj, and the Pentelican marble is as good as it ever was. Its richness of texture, the faint streaking of iron pyrites in its composition relieving the dulness of ab-

and giving it a sort of sunny radiance as contrasted with the glassy and soulless lustre of the Italian marble, render it peculiarly suitable for building on a large scale.

#### *The Site.*

When I first broached the subject of the Victoria Hall at Calcutta, I indicated the north-east corner of the Maidan as the most suitable site, and I proposed that the ground about it should be converted into exquisite public gardens, in the centre of which should stand the memorial building. Since then I have made frequent detailed inspections of the site, and have tried it with every other possible locality on other parts of the Maidan. The only other at all eligible sites are the space between Eden Gardens and the Law Courts, and the site now occupied by the Presidency gaol, which the Bengal Government is anxious to vacate. The former plot of ground is much cramped. No view of the new building could be procured anywhere. No fine approach to it would be possible, and the building would be shut in between the cricket ground, the river, the courts and Government House Gardens. A great Classical building in marble would jar with a great Gothic building in stone, and yet the two would be separated at most only by a few yards. On the other hand, the site of the gaol is too far removed from the more populous quarters of the town, and the building would not attract as many visitors, or be as accessible to the public as it will be if placed at the nearer end of the Maidan. A third site has been mentioned near Prinsep's Ghat. Here, also, the space is too confined; there is no scope for an approach to the building, which could not be well except from the river; and I should not like to expose the exterior or the contents of the hall to the smoke of the funnels of the steamers always pouring across the Strand from the funnels of the river and the sooty chimney-stacks of Howrah. It appears on examination that the site originally suggested has no superior to any other.

Proceeding a little further, it may be laid down that the essentials to be borne in mind in determining the exact site are that the orientation of the building shall be such to make it askew with the principal neighbouring structural roads; that it shall have a fine approach; that its front shall face in a direction where it can be seen from the river, and that, if it is to contain, as has been suggested, a public hall, this shall be on a side where it will be easily accessible from the town, without interfering with the remaineries of the building. A careful correlation of all these results in the conclusion that the four sides of the main hall should face the four points of the compass, that the hall should be on the Chowringhee side, and that the western front should look straight towards the Maidan river, the axis of its main entrance being determined by the road which runs from Eden Gardens past the Lawrence Road from due west to due east. The porch of the Victoria Hall should be in a direct line with the centre of this road, after passing round the Hardinge statue, will then, by a sweep or otherwise, approach the main terrace of the hall and the great central flight of steps. In this case the Victoria Hall will be the main object from every part of the Maidan. It will emerge into view to anyone coming from Old Council House Street directly the corner of the Esplanade Row is reached. It will confront the visitor coming from the river with the full line of its main façade, dome and entrance arch will appear at the end of a fine approach already provided for the purpose.

The acceptance of the site here suggested will involve the removal of the Ochterlony Monument, since, although the Victoria Hall will not actually encroach upon the site of the monument, the south wall of the hall will be so near to it as to the juxtaposition of the two objects impossible and undesirable. Now if I am to be quite frank myself, I must confess I regard the Ochterlony Monument as the reverse of what I would like, and that in my opinion a bronze statue of that brave and distinguished commander would provide a more fitting commemoration of his illustrious services and career than the peculiar structure. But I recognise that to many it has become dear as a landmark of old Calcutta, and I may remark it is not a very old Calcutta, since the monument has only been standing for seventy years. I would, therefore, in this way. My own inclination would be to substitute a statue of Sir David Ochterlony in a prominent position on the Maidan or in the grounds of the Victoria Hall. Far more people would learn to know who he was by what he did by gazing upon his features in bronze climbing up the interior staircase of a brick and mortar pillar. In so far as the latter is required for the purposes of outlook, I will undertake to provide a better from the dome of the Victoria Hall, which will be at least as high as the Ochterlony Monument. Should, however, there be an over-expression of public opinion in favour of a reproduction of the Ochterlony Monument in its present form, then we might consider the re-erection of it on some other part of the Maidan. In such a case, however, I should greatly

fear the reproaches of posterity as to the narrow range of the artistic perceptions of the present Viceroy and his advisers.

#### *Procuring Designs.*

4. The remaining subject to be discussed is the best method of procuring designs. At first sight nothing seems better than to appeal to public competition in India and elsewhere, but a little reflection will reveal the deficiencies of this method. In India itself we have not many architects, though we have some who are qualified to erect, and have erected very pretty buildings in different varieties of the Hindu and Saracenic styles. It is doubtful, however, whether we could discover anyone with technical training or practical experience to undertake what ought to be one of the architectural masterpieces of the world. The last experience of Government, when we threw open designs for the new military secretariat at the north end of the Maidan to open competition, were not such as to encourage me to expect from this method the most satisfactory results. The difficulties as regards home competition are even greater, as if designs for a great public building in Europe are called for, every competitor can go in a few hours, or at the most, a few days to the spot. He can familiarise himself with the site and surroundings, while he will receive from the supervisory committee in personal interviews and consultation the most detailed information as to what is required. Here all is different. We cannot import a number of English architects to Calcutta to look at the ground and to study our conditions. Without any knowledge of Calcutta or of the Maidan, or of the Bengal climate, or of labour conditions and resources of India in marble and stone, an architect sitting in his chambers in London and drawing plans would be entirely at sea. We have not yet, until we know how much money we are likely to raise before the subscription lists are finally closed, been in a position to say what are the scale and character of the building that will be required, or what should be its internal arrangements. Even had we been ready with all these particulars, had we published them in suitable quarters at home, and had we received in response several hundred drawings, as I doubt not that we should have done, who is there among us who would have been qualified to choose from among them? And had we chosen, and had our choice fallen, as it probably would have done, on the design that seemed externally the prettiest to the majority of our number, who could guarantee that the architect who had drawn the most elegant elevation would be competent, in a foreign land of which he knew nothing and where everything is so different from Europe, to translate his paper design into a concrete structure? These difficulties and drawbacks are in reality so obvious as to need no further exposition. They were enhanced by the knowledge, which I derived from the most authoritative quarters, that the best English architects would decline to enter any such competition, and that we should to a large extent be dependent upon chance. In these circumstances I consulted those authorities in England who, in connection with the English memorial to the late Queen, had been brought in contact with all the most prominent English architects, and who were aware of their attainments and inclinations.

I was strongly advised to invite out to India Mr. William Emerson, president of the Institute of British Architects, to confer with me on the matter and to give me his advice. Mr. Emerson has had the advantage of having worked for many years of his life in India, where he has built some of the most important edifices at Allahabad and elsewhere, and consequently of being thoroughly familiar with Indian conditions, climate, materials and labour. He is also the architect who was accorded the first prize in the competition of designs for the Liverpool Cathedral, a building to be erected in the Classical style. I entered into communication with Mr. Emerson and invited him to Calcutta, where he spent ten days at the beginning of the year. There was no question connected with the building, its site, style, design, material, dimensions, structural arrangement, decorative features, accommodation and contents, which we did not thoroughly discuss. Between us we had already procured many scores of photographs of the most beautiful or famous Classical buildings in the world, and we were not less ready to borrow from the wisdom of the past than we were to formulate new conceptions. Relying upon the somewhat full description that I had given a year ago of the probable style and requirements of the Victoria Hall, Mr. Emerson had already prepared himself with many sketches and plans. These he revised and reconstructed while staying with me, and I am now in a position to discuss with the new committee the steps that should next be taken. I should add that no sort of arrangement has been made with Mr. Emerson, nor has any pledge been given to him. I have not the authority to bind anyone in the matter. A stage has, however, now been reached at which it will be necessary to decide whether Mr. Emerson be asked to furnish detailed drawings, or whether fresh and independent measures should be adopted. In order to furnish some idea of the line upon which Mr. Emerson, if

invited, would probably be inclined to proceed, I will briefly describe the nature and appearance of the design which was the outcome of our deliberations.

The nature of the soil in the Maidan is such that the foundations cannot be sunk to much greater depth than 4 feet. If a building of great size and weight is to be placed upon it, the foundations will therefore have to be continued above the surface of the ground. In other words, the fabric will have to be raised upon a terrace several feet in height. So far from regarding this as a defect, it seems to me a great advantage. It is an architectural device familiar in the cases of nearly all Mogul monuments, notably the Taj, and of many of the finest buildings in the world. Height and dignity will be given to the fabric if it be thus lifted, while the appearance of the white marble terrace balustrade around, ascended by a great flight of steps and supporting this main pile, will in itself be one of the main features of beauty. This terrace would probably be from 350 to 400 feet in length, and the building upon it of somewhat smaller dimensions. It is suggested that the form of the fabric should be a parallelogram, of which the main faces would be eastern and western, terminating in towers, and connected at the ends with curving, open colonnades. In the centre of the building would be the Queen's Hall, a circular marble chamber under a lofty dome rising to a height of some 160 feet from the floor. On either side, north and south of the central hall and dome, would be the interior garden court, surrounded by a two-storeyed loggia or arcade. We will suppose the visitor were entering this building from the main or western front. Perhaps an idea of its appearance and contents may be conveyed by attempting to follow in his footsteps. From the Maidan he would climb the great flight of marble steps to the level of the terrace. Upon this terrace, in front of him to the right and left would stretch the main façade of the building. In the centre would be a colossal entrance archway, under which would be placed upon its pedestal Mr. Frampton's bronze statue of the Queen, which was ordered at the time of the Jubilee in 1897, and which, having recently arrived in Calcutta, is about to be placed on a temporary site at the entrance to the Red Road. Mr. Frampton has been consulted on the matter, and it is his own desire that his statue should, if possible, be furnished with such a framework and background as the entrance to the Victoria Hall would provide. To the right and left of this main archway would stretch the white marble front of the building, terminating at the extremities, as has been said, in towers. The right hand or southern tower would be in immediate proximity to the site of the present Ochterlony Monument.

Entering under the archway, and passing the seated figure of the Queen, the visitor would proceed into an entrance hall or vestibule devoted to the collection of objects connected with her history, personality and reign. Here would be hung the series of pictures depicting important incidents in her life, which have already been presented to us by His Majesty the King. Passing through this, he would enter straight into the space under the dome. In this hall, the centre and core of the building, I contemplate that no other object should be placed but a white marble crowned statue of the Queen as a young woman raised upon a pedestal. Outside in the porch she will be depicted in bronze in a sitting posture as she was in advanced years; inside I would represent her standing as she appeared in her girlish grace when first she ascended the throne. Around the hall I would place the inscriptions in different tongues which I spoke of last year. Through the domed hall one would proceed to the similar exit on the eastern or Chowringhee face. Retracing our footsteps for a moment to the vestibule of the Queen's relics, we will suppose the visitor intends to inspect the remaining galleries of the building. If he turns to the left he will enter the great sculpture gallery, where he will see marble images of Warren Hastings, of Cornwallis, of Wellesley, of Hastings, of Dalhousie, and of many another *clarum et venerabile nomen*. This gallery will terminate in the left tower, with rooms for the curator, attendants, and lift. If he turns from the Queen's vestibule to the right he will enter the gallery of pictures, where he will see a long procession of likenesses of the men who rendered India famous during the last two hundred years. Through this he will pass to the right-hand tower, where the smaller rooms will be devoted to collections of prints, engravings, coins, and the like. The curving open colonnades will at either end connect these towers with similar towers at the extremities of the eastern façade. Should additional internal accommodation ever be required, the colonnade could be filled in or replaced by separate galleries. We will now suppose that our visitor, after inspecting the Queen's statue under the dome, intends to pass out towards the Chowringhee approach. In correspondence with the Queen's vestibule on the west side, he will enter the Hall of Princes on the eastern side, where the Indian princes will be invited to place such collections on gifts or on loan as they may be willing to offer. Here, as before, he will be able to branch off to the right or to the left. If he proceeds to the right he will pass

into a two-storeyed gallery, one floor of which will be devoted to Models (of famous buildings, sieges, battles, &c.), the other the Hall of Arms, where will be a collection of trophies, uniforms, weapons, flags, medals and guns. Passing to the left he will enter the great Durbar Hall, which will embrace two floors, and will occupy the entire north wing. This hall will be used for any ceremonial purposes, such as investitures, that may be held in Calcutta, and also be available, under strictly defined conditions, for other purposes, such, for instance, as the meeting held last year in commemoration of the late Queen. It should be the finest public hall in India. Placed in close proximity to the Chowringhee entrance, it will be readily accessible to the public and can be utilised quite independently of the Victoria Hall and without any interference with the latter. On the eastern façade there would be an exit facing the big clump of trees which occupies that part of the Maidan, round which a broad sweep would lead to Chowringhee.

Such, so far as words without a plan can bring it to the mind, is a rough sketch of the Victoria Hall as I like to see it planned. There remains only to be discussed the question of the surroundings. Here we must, to some extent, be guided by pecuniary considerations. The enclosing the plot by a large space of ground as a public garden, fencing it in with handsome iron railings, and the provision of suitable gates, will be a very expensive affair. But I everywhere conceded that such a building as it is proposed must in no wise suffer from lack of an adequate site, and that the grounds must be ample and beautiful. The site that seems most naturally to fall within the desired limits is that section of the Maidan that extends from Esplanade Row on the north to the intersection of the tram line and carriage road at the Mayor statue. The plot of ground included within these boundaries is about 30 acres, and embraces a part of the Maidan that is not used for games, but that is also year by year becoming increasingly shabby and denuded of grass. Tastefully laid out and with a simplicity worthy of the fabric that it will contain, the garden ought to be a great addition, both to the beauty of Calcutta and to the enjoyment of the public. It will be open by day, but not, of course, by night. The excavations for the foundations of the Victoria Hall will at the same time provide a suitable means of reclaiming the remainder of the Dhurrumtollah Tank, which has already been partially filled in.

These are the rough outlines of the work that is contemplated. For its successful execution a term of many years will in any case be required, while the sum at disposal of the committee is not yet such as to free the public from anxiety, or to render us reluctant to accept any further contributions that may be offered to the fund. Perhaps in the course of the years donors may be found to help us with independent gifts of railings, fountains or gates, while there is reason to hope for subscriptions in many quarters from which no response yet come. It must further be remembered that, in addition to the outlay upon the building and garden, considerable will be required for the purchase of the contents, up to the endowment.

## TESSERÆ.

### Ratio of Breadth to Height in Churches.

Too much stress is often laid on the greater proportion of height to breadth in the French Gothic architecture. It is not a general feature, the great majority of such visible countries alike having the height equal to twice the breadth. A higher proportion is confined to buildings of the largest size, for the larger they are the greater may this proportion be without appearing excessive. In England the chief exception of a proportion higher than the double breadth are at Salisbury, Winchester, Canterbury and Westminster, which is only in the building, both absolutely and in its relation to the site, which is as three to one. In France the same ratio is in the largest buildings, and is not exceeded either in Chartres, Paris, Orleans or Rouen cathedrals; but in the neighbouring St. Ouen and the colossal Amiens have the proportion of three and a half to one, which (especially in the latter) appear too great. St. Wulfram, at Abbeville, seems to still loftier proportion, or else, not being on a particularly high scale, this proportion is felt to be excessive. It might be supposed that the introduction of arching, by enabling wide openings to be covered than by lintels, while at the same time requiring more extent of abutment (for the same width of opening the higher it was raised above the ground, would for the same reasons have led to openings of a lower and wider proportion both in windows, arches, avenues and entire buildings. This was not the case, at least not in ecclesiastical buildings, designers of which continued to be fully alive to the necessity of tall proportions, even when obtained at the expense of cost and convenience, and they never, till the latest period,

admitted archways for any purpose, great or small, lower than their breadth.

### Early English Docks.

The first wet-dock for commercial purposes made in this country was formed in the year 1708 at Liverpool, then a place of no importance. It went by the name of the "Old Dock," but it was filled up at a later time and the site was taken by the Custom House. The first commercial wet-dock constructed in the port of London was for the accommodation of vessels employed in the Greenland whale-fishery, and was provided with the necessary apparatus for boiling the blubber. This branch of trade having almost entirely left the port of London, the dock was opened for the reception of vessels employed in the European timber and corn trades, and was given over to the latter a range of granaries was built. This dock, which is now known as the Commercial Dock, is situated at Rotherhithe. Up to the end of the eighteenth century all ships arriving in London, with the exception of the Greenland whale-ships, discharged their cargoes into lighters in the river. The continually increasing inconvenience thus caused by the growing trade of the port was much aggravated during a time of war by the presence of the West India ships arriving together in great numbers under convoy. To remedy this inconvenience a scheme was projected in 1793 for constructing wet-docks for the accommodation of ships employed in the West India trade, but it was not until 1799 that the scheme was sanctioned by Parliament, and that an Act was passed incorporating a company for the purpose with a capital or joint-stock of £1,380,000. Docks constructed under this Act of incorporation are known as the West India Docks. Their construction was commenced in February 1800, and was prosecuted so vigorously that in less than two years and a half from that time the works were fully advanced to admit vessels for unloading. The West India Docks were commenced in 1801, and were opened in 1804, owing to the want of accommodation in them. The St. Katherine Docks were constructed and opened in 1804, and the docks at Bristol were commenced in 1804, under the authority of an Act of Parliament obtained by Geo. III., and were first opened in 1809. They were formed by digging a new course for the Avon south of the old one, and by converting the whole of the old channel, from the old dam erected above the Bristol Bridge in St. Philip's parish to the entrance lock at Rownham, including the branch quays within the quays of St. Augustine and St. Andrew, into one floating harbour about three miles in length.

### The Greek Canon of Proportion.

The Greek canons of human proportion may be taken as a standard into law, the innate taste of the Greeks, their theories of studying and their loving study of the subject, leading to invest their conclusions with an authority which has since been questioned. They divided a perfectly proportioned human figure into ten or eight parts—ten if the face be taken as the divider, eight if the head—the face into three parts, from the root of the hair to the spring of the nose, the nose, one; and one from the nose to the bottom of the chin; from the root of the hair to the top of the head gave four parts, and constituted what is technically called a canon. To the heroic human figure were given eight heads or eight times the height of the head in the lengths. In like manner heads or parts of heads were measured the length of the upper and lower extremities, and also of the trunk. Whether or not these measurements were actually found among the beautiful inhabitants of Asia we do not know; but they are not the average proportions of modern dwellers in the cities of Europe, the head, and especially the face, being usually disproportionately large. It is common to find the relative proportions of the limbs corresponding with the Greek measurements, with rather a tendency to shortness of the lower extremities; but the small head is so far unusual that it is remarkable and justly considered a great beauty. Attention may be called to the fact that bigness and smallness are not the same things, though commonly confounded together. A person may be of tall proportions on a small scale and of short proportions on a large one. A model of a man may be 2 feet high, preserving the heroic or divine proportions, tall as a god, while a model of a dwarf may be 1 foot high, having still the stumpy proportions of a dwarf.

### Counterfeit Styles of Art.

It is greatly for the health and strength of early art as Italy as in Germany that it did not begin with imagination and what is true of the progress of a school is true of the progress of an individual, for the young painter who begins with imagination (and this was the fatal mistake of Blake) is at the wrong end of the art. Hogarth painted portraits of groups before he began to invent, and the angels of the Christian painters were but a higher order of the attendants

of the altar, while the attitudes and expressions, and generally the garments of their saints were suggested by the realities that were every day before their eyes in churches and convents. But in proportion as the imaginative faculty developed itself the painters ceased to introduce into sacred subjects priestly habits, and the practice was entirely laid aside by Michelangelo and Raphael, in whose hands the art became truly poetic and entirely Catholic. Eastlake says that "among the merits or recommendations of the cartoons may be reckoned their being interesting in all places and to all classes of Christians. But for this circumstance, perhaps, we should not now possess them, for when the treasures of art collected by Charles I. were sold, and such pictures as were deemed 'superstitious' even ordered to be 'forthwith burnt,' the cartoons would hardly have been repurchased by Cromwell, to whom we are indebted for preserving them to the nation, if they could have been considered to come within the proscribed class. Nothing can more strikingly show the universality of Raphael's mind. But the young painter is now told that he must 'ascend to the fountain head, that he must study Duccio and Giotto that he may paint like Taddeo di Bertolo and Masaccio—Taddeo di Bertolo and Masaccio that he may paint like Perugino and Lucca Signorelli—and Perugino and Lucca Signorelli that he may paint like Raphael and Michelangelo.' But why should he aim to paint like any, even the last of these? Why attempt that which never has and therefore never can be accomplished? namely, the reproduction of the exact style of any age or master. Northcote was told that a picture had been painted by a living artist that might be mistaken for a Claude. 'Then I know,' was his reply, 'that it is good for nothing; if you should tell me that a picture were painted as fine as a Claude it would be quite another thing, for to be equal to Claude a painter must be as distinct from him as he was from all the painters before him. He must have looked at nature for himself, as Claude did, availing himself of the assistance of previous art only in the degree in which Claude did so.'

### Impost Mouldings.

The horizontal mouldings serving as a sort of cap or cornice to the piers of arches, and on which the archivolt or curved mouldings and facie surrounding the arches themselves rest, are known as an impost. Like these latter, the impost is made plainer or richer, according to the order employed or to the general character of the design. And when the archivolt of the arches are omitted, either the impost is omitted likewise or a plain band is substituted for it. This is generally done in basements beneath an order, they being usually rusticated, and the joints of the rustics sufficing for decoration and giving the requisite architectural expression. Imposts are contrary to the genius of the Pointed style, but, except in the case above alluded to, essential in Roman and Greco-Roman architecture. We have, however, a few instances in which impost has been omitted, and the archivolt of the arch continued vertically down the edges of the piers. This was a favourite practice with Soane, both in his designs and many of his executed buildings, and it was also adopted by Burton in the arches of the Ionic screen and opposite gateway, Hyde Park Corner, Piccadilly; but the effect is by no means happy, especially in external architecture, though it may be tolerated in buildings on a small scale, or which make no pretensions to correctness of style.

### The Basilica.

As Milman remarks, in referring to the Roman basilicas, that "as these buildings were numerous, and attached to any imperial residence, they might be bestowed at once on the Christians without either interfering with the course of justice, or bringing the religious feelings of the hostile parties into collision." Still, the instances of actual transformation are exceedingly rare—in most cases it must have been impossible from the erection of the early Christian churches on the graves, real or supposed, of martyrs and apostles, which, according to the almost universal practice of the ancient world, were necessarily without the walls of the city, as the halls of justice, from their connection with everyday life, were necessarily within. It is in some such grounds as these, we imagine, that M. Bunsen conceives there must have been something in the type itself of the basilica, at least not uncongenial to the early Christian views of worship, independent of any causes of mere accidental convenience. There were reasons for the rejection of the temple plan, although familiar to the Romans. There was now a church, a congregation, an assembly, which could no longer be hemmed within the narrow precincts, or detained in the outer courts of the heathen *temenos* or enclosure; where could they be so naturally placed as in the long aisles which had received the concourse of the Roman populace, and which now became the nave of the Christian cathedrals? Whatever distinctions existed in the Christian society were derived, not as in the Jewish temple, from any notions of inherent religious differences between different classes of men, but merely, as in the Jewish synagogue, from considerations of

order and decency, and where could these be found more readily than in the separate places still retained by the sexes in the aisles of the basilica, or the appropriation of the upper end of the building to the clergy and singers, from whose ministration it became transformed into the choir or chorus? There was a law to be proclaimed, and a verdict to be pronounced by the highest offices of the new society, and what more natural than that the bishop should take his seat on the lofty tribunal of the prætor, and thence rebuke, exhort or command with an authority not the less convincing because it was moral and not legal? There was, lastly, a bond of communion between all the members of that assembly to which the occupants of the temple and the basilica had been alike strangers—what more fitting than that the empty centre of the ancient judgment hall, where its several avenues and aisles joined in one, should now receive a new meaning, and that there, neither in the choir nor nave, but in the midst of them all, should be erected the altar or table of that communion which was to belong exclusively neither to the clergy nor to the people, but to bind both together in indissoluble harmony?

#### The Panorama of Rome.

It is the peculiar distinction of Rome to have been not merely a capital, but the capital of the world, in a sense in which no other city has been or is likely to be again—that though never, until lately, the capital of Italy, it yet did eventually become the capital of the ancient civilised world. And it is precisely of this closing period—not of the period of its growth and of its struggles—that the Roman ruins bear the deepest impress. What a mist is rolled away from our eyes the moment that we are allowed to trace the course of the Via Sacra up to the Temple of the Capitoline Jupiter on its rightful place upon the Tarpeian rock, and to find the true direction of the Forum in the open space between the Capitol and the Colosseum. How naturally does the execution of the Catilinarian conspirators rise before us, when, in the substructures which lie immediately beneath the scene of their imprisonment in the Mamertine prison, we recognise the basements of the Temple of Concord, in which the Senate was convened to pronounce the fatal sentence. How lively is the interest with which we regard the three pillars which stand immediately in front of the ancient Treasury, hewn out of the Capitoline rock, when we discover in them the remains of the Temple of Saturn, whose gates the Tribune vainly endeavoured to defend against the attempts of Cæsar to appropriate the treasures of the State which lay behind it. Still, when from particular details we turn to the general effect of the whole scene, there can be no doubt that it is not Republican but Imperial Rome which rivets our attention. It is almost startling to observe the peculiar significance of almost all that remains of that time, when its material and outward aspect most truly represented its inward life. Let any one look over the mass of ruins within the city, as he stands on the tower of the Capitol—the Temple of Vespasian, vindicating by its solitary grandeur its just title, which connects it with the restorer of the city after the desolation which had laid it waste from Galba to Vitellius—the crash of the Palace of the Cæsars on the hill from which it derives its name—the huge mountain of the Amphitheatre of Titus—the three triumphal arches, each with the mark of destiny on its front; or let him gaze on that perhaps yet sublimer view without the city, which is commanded by the terrace of the Lateran Church—the desolate Campagna, with the ever-varying lights and shades empurpling its deep indentations—the long files of broken aqueducts advancing, as if in melancholy cavalcades, towards the city which they never reach; and he will feel that he has seen the ruin of the most august power that was ever enthroned upon the earth—he will understand how truly the Apocalyptic Seer saw in the imperial city which sat upon the Seven Hills, though in a greater and more awful form, a true revival of no less than the ancient Babylon.

#### GENERAL.

**Mr. Seymour Lucas, R.A.**, has had the honour of submitting a picture of the reception of the mission from the Sultan of Morocco by the King at St. James's Palace, which he is painting for His Majesty.

**A Memorial Tablet to Charles II.** has been set up at Chalmouth, where the monarch spent a night waiting for a boat which was to be provided at Lyme Regis, and another tablet at Ellesdon farmhouse. A third will be unveiled to-day at Broadwindsor.

**M. Léon Noel**, the actor, who is now appearing in Paris in the "Courier of Lyons," has informed an interviewer that his country house has been constructed with materials derived from a church dedicated to St. Firmin at Arc-en-Brie, and erected by St. Louis in 1257.

**M. Theobald Chartran**, the French artist, who is intimate friend and comrade in the field of the late Regnault, is now in America. Among his latest portraits are those of Mrs. Roosevelt and Miss Roosevelt, the daughter of the President.

**Mr. J. Oldrid Scott** prepared the design for a silver mace presented last Saturday to the Dean of Salisbury by the ladies of the diocese, for use in the services at the cathedral.

**The Municipal Architects** of Paris have begun the completion of the revision of the cadastral survey which occupied them during three years. It has been ascertained that there exist 74,025 properties in houses, and 1,000 buildings.

**Mr. G. H. Chance**, the formerly well-known French painter, has died in London at the age of ninety-five. He was assistant to the elder John Linnell, father of the late painter, and afterwards succeeded to the business.

**Calcutta** is to be improved by driving wide open roads through the slums of the city at a cost of 10 millions sterling.

**A Builder** was fined 10s. and a working painter 5s. for costs in the Marylebone police court on Tuesday for obstruction, annoyance and danger of persons passing the street by standing on a window-sill for the purpose of looking out of the window, such sill being more than 6 feet from the ground, without supports sufficient to prevent falling.

**The First Exhibition** of the Society of Illumination opened yesterday in Paris. Not more than forty members were admitted. The president is M. Atalaya, and the vice-president M. Foucher.

**The Swiss Parliament House** in Berne was opened on Tuesday. The buildings, which have cost 8,000,000 francs, were designed by Professor Auer, of St. Gall. Swiss and Swiss material were employed in the embellishment of the building. The new palace, which is surmounted by a cupola, is placed between the two Government palaces, whole now constituting one building.

**A Stained Glass Memorial East Window** and a gate were dedicated on Saturday last at the old church of St. James's, Shere. The lych-gate is of local construction, the design of Mr. Lutyens.

**An Official Inspection of Bridges** in France is now accomplished every five years, but henceforth one-fifth of the steel bridges on railways and public roads will be inspected each year.

**Mr. Peter S. McIntyre** has been appointed to a scholarship in the British School of Archaeology in Rome by the University of St. Andrew. This is understood to be the first appointment of the kind that has been made by a Scottish University.

**Mr. T. W. Shore, F.G.S.**, has come to the conclusion that the "Round Table" in the Castle Hall, Winchester, dates about the year 1252-53, and that the term "Round Table" was the name for a knightly order, or knights assembly, or tournament, such as kings were wont to hold at Winchester, the days when the city was a royal place of residence.

**The Exhibition** of royal portraits at the New Gallery will not be closed until Saturday, the 12th inst.

**Mr. George James Frampton**, sculptor, was at the general assembly of the Royal Academy elected an Associate Academician. He was born in 1860 and obtained the gold medal of the Academy in 1887. He worked in the ateliers of M. Bouveret and M. Mercié in Paris.

**The Court of Governors** of the University of Wales, Aberystwith, have decided to extend the department at a cost of about 5,500*l.* Upon the question of a national museum for Wales, the governors believe that regard to the geographical and educational condition of the Principality, the objects in view would be best served by the libraries or museums of a national character in the centres of university education in Wales.

**The Works** of Messrs. Doulton & Co. at Lambeth were visited on Wednesday next, at 2 30 P.M., by students of the Institution of Civil Engineers.

**Archbishop Eyre** died in Glasgow last week. He was not a Scotsman, from the time he was called to the see he devoted much study to its ancient buildings. He was an earnest supporter of the Glasgow Archaeological Society.

**The Series** of Saturday afternoon excursions of the Geological Field Class, conducted by Professor H. G. F.R.S., will commence on April 26, when a visit will be made to Erith, and the excursions will be continued on each Saturday (except on Saturdays before Whitsuntide and Coronation week) until July 12. Further particulars may be obtained from the hon. general secretary, Mr. R. Bentley, 43 Gloucester Road, Brownswood Park, N.

## EDITORIAL NOTICES.

few of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

Authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

## TENDERS, ETC.

A great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

## COMPETITIONS OPEN.

STRALIA.—May 1.—Designs are invited from sculptors for a memorial statue of Her late Majesty in marble or bronze. Information can be obtained at the office of the Agent-General for the State of Victoria, 15 Victoria Street, West.

HARROGATE.—May 14.—Designs required for a new town. Premiums, 150*l.*, 100*l.* and 75*l.* Mr. F. Bagshaw, town engineer, Harrogate.

GLASGOW.—April 21.—Designs are invited for twenty-five men's houses for the Coleraine Urban District Council. Premiums, 10*l.* Mr. W. Henry, clerk to the Council.

GLASGOW.—April 21.—Prizes of 20*l.* and 10*l.* respectively awarded for the first and second schemes in order of merit for utilising to the best advantage a plot of ground offered by the Council for the erection of about twenty-five men's houses in Coleraine. Mr. William Henry, clerk, Coleraine.

KNARESBOROUGH.—June 1.—The Harrogate and Knareborough Joint Isolation Hospital Committee invite competitive designs for an infectious disease (other than smallpox) hospital at Thistle Hill, Knareborough. Premiums of 100*l.* and 50*l.* are offered for the two selected designs. Mr. J. Turner Taylor, clerk, Municipal Offices, Harrogate.

LIVERPOOL.—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

MEXBOROUGH.—May 1.—The committee of the Mexborough Montagu Hospital invite plans for the erection of an accident hospital for both sexes, for the treatment of thirty patients, with the needful nurses and servants' accommodation. Premiums of 25*l.* and 10*l.* are offered, the premium awarded to merge in the commission. Mr. C. Brumpton, secretary, Fern Villa, Mexborough, near Rotherham, Yorkshire.

OLDHAM.—April 8.—Competitive drawings are invited for erection of new market hall and shops in Albion Street and Henshaw Street. Premiums will be awarded to the authors of the three selected designs, viz. 50*l.* for the design placed first, 30*l.* for the design placed second, and 20*l.* for the design placed third. Mr. S. A. Pickering, borough surveyor, Oldham.

SCOTLAND.—April 30.—Designs are invited for a branch library for the Anderston district, Glasgow. Sir J. D. Marwick, town clerk, Glasgow.

SUNDERLAND.—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100*l.*, 50*l.* and 25*l.* are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

YORK.—May 1.—Designs are invited for a Memorial to the late Queen Victoria to be placed in the Guildhall, York. The design must include a representation of Her Majesty, and be accompanied by an estimate of the cost of the work complete, such cost not to exceed 1,000*l.* A prize of 50*l.* (to merge in the commission) will be given for the accepted design. Mr. W. H. Andrews, town clerk, Guildhall, York.

## CONTRACTS OPEN.

ALDERSHOT.—April 15.—For erection of eight cottages, stabling with harness-room, coachhouse, &c., eight prisoners' cells and sundry alterations and additions at Aldershot police-station. Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

ASHFORD.—April 18.—For supply of a four horse-power self-contained vertical engine at the schools at Ashford, Middlesex. Mr. F. G. Beeching, clerk to the managers, Ashford, Middlesex.

BARROW-IN-FURNESS.—April 15.—For alterations to the Hindpool Road Wesleyan chapel. Messrs. Sames & Henshaw, architects, Abbey Road, Barrow.

BARTON-ON-HUMBER.—April 15.—For erection of a mission church at Barton-on-Humber. Mr. C. Hodgson Fowler, architect, Durham.

BATH.—April 14.—For sundry works at the Bath Statutory Hospital, Claverton Down. Mr. F. W. Gardiner, architect, Barton Street, Bath.

BEAMINSTER.—April 8.—For erection of an institute and public hall at Beaminster, Dorset. Messrs. Kitson & Trotman, Fleet Street, Beaminster.

BEXLEY HEATH.—April 28.—For the supply of tramway rails and accessories, and the supply and erection of engines, alternators, dynamos, &c. Mr. T. G. Baynes, clerk, Public Hall, Bexley Heath.

## SPECIALTY.

ERECTION OF ROUND FACTORY CHIMNEY-STACKS  
ON THE

## "CUSTODIS SYSTEM,"

With Specially Constructed Patent Blocks.

ons Custodis Chimney Construction Co., SHEFFIELD.

**BLACKBURN.**—April 22.—For erection of premises in Darwen Street, Blackburn, for the Lancashire and Yorkshire Bank, Ltd. Messrs. Stones & Stones, architects, 10 Richmond Terrace, Blackburn.

**BLACKPOOL.**—April 8.—For erection of public mortuary and post-mortem chamber, off New Road. Mr. John S. Brodie, borough surveyor, Town Hall, Blackpool.

**BRADFORD.**—April 9.—For erection of a shed at Eastwood Mills, Bradford. Messrs. Empsall & Clarkson, architects, 7 Exchange, Bradford.

**BRADFORD.**—April 15.—For erection of bakery at Great Horton. Messrs. Morley & Co., King Cross, Halifax.

**BRIDLINGTON.**—April 8.—For construction of a road bridge (steel girders and brick abutments) over the Hull and Scarborough railway at Bessingby Road crossing, Bridlington, for the North-Eastern Railway Company. Mr. C. N. Wilkinson, secretary, York.

**BUXTON.**—For alterations and additions to the Catholic schools. Messrs. Garlick & Flint, architects, Terrace Road, Buxton.

**BURNHAM-ON-CROUCH.**—For additions to the schools. Messrs. Chancellor & Son, architects, Chelmsford.

## KENT MAIN-ROAD TENDERS.

The bridges and roads committee of the Kent County Council met at Maidstone on Wednesday in last week for the purpose of receiving tenders for the maintenance of the main roads of the county for the next three years. The committee had been in full power to deal with the contracts, and much interest, therefore, centred in the meeting, at which there was a full attendance of members. The proceedings were private, but the *South-Eastern Gazette*, that there was a considerable discussion with regard to the form in which the specifications had been issued, it being contended that quartzite, contrary to an express undertaking given to the County Council on behalf of the committee was unduly favoured to the practical exclusion of other material. In the end it was decided that fresh specifications should be drawn up and new tenders invited, the explanation to the public to be that an error was made and to have occurred in drawing up the specifications and conditions first issued. The turn thus given to affairs caused a considerable amount of surprise amongst those interested, and there was much discussion on the subject of the committee's action in contracting circles after the meeting. The trouble, however, arose in consequence of hand-broken material being used in the first specifications, contractors finding it impossible to guarantee compliance with this condition except by introducing quartzite. The new tenders are to be in by April 21.

At Darlington sanction has been given to build on the Corporation Road a new Wesleyan church and classrooms, at an estimated cost of 6,000*l*.

WE have been requested to announce by Messrs. H. Y. & Co., Limited, their change of address from Eccleston Iron Works, Pimlico, to Nine Elms Iron Works, London, S.W., where all communications should be addressed.

THE Leeds branch of the Painters and Decorators' Union is seeking to obtain an alteration in the working rules. Negotiations with the employers are in progress. It has been agreed that the time-and-a-quarter rate of overtime shall be abolished, but that after 8 P.M. the rate shall be time-and-a-half. What the length of the working day shall be is still under consideration. The masters, it is understood, want 10 hours, with no interval for breakfast, whilst the operatives desire to commence work at 6.30 and have a breakfast-time. The men are paid by the hour.

## MAY-OATWAY FIRE ALARM.

Since the recent practical test of this system at Ilford, bookings have been very heavy.

Dingle Station, the scene of the late fatal fire, is now protected by the May-Oatway System and connected direct with the Liverpool Fire Brigade.

The Manchester-with-Chorlton Guardians have contracted with the MAY-OATWAY FIRE APPLIANCES, LTD., to protect their Workhouse from fire.

No person need risk life or property by fire. The MAY-OATWAY automatic bedroom indicator will show on retiring that the house is safe, and wake you immediately and indicate its position when a fire breaks out.

### TRADE NOTE.

ESSRS. DUKE & OCKENDEN, artesian well borers, of Littlehampton and 126 Southwark Street, London, have been successful in securing the contract from the Jockey Club for watering of Cambridge Hill Tan Gallop, and the deepening the existing well on Newmarket Heath. The engineers are Messrs. John Taylor, Sons & Santo Crimp, of Westminster.

### ELECTRIC NOTES.

E sanction of the Local Government Board has been given to the application of the Manchester Corporation to borrow 477,000*l.* for electricity purposes.

ON Saturday evening last for the first time St. Paul's Cathedral was lighted by electricity. The effect was eminently satisfactory, and is a great improvement on the dim religious light of the past.

A SERIOUS breakdown of Glasgow electric light took place this morning of the 28th ult. The electric current became weak about half-past one o'clock, and at two o'clock there was general extinction of the light throughout the city. The cause was due to one or two faults in the mains. A partial restoration of the light was immediately effected, and by four o'clock three-fourths of the lamps were burning again. Usual darkness prevailed in Glasgow at the time, owing to a thick fog which settled over the city shortly after daybreak.

THE new electric station now in course of erection at Deege for the Corporation of Aberdeen was inspected on the 28th ult. by the members of the Town Council. The engine-house is capable of containing about 6,000 horse-power and dynamos together, with the necessary switchboards, condensing plant, &c. In connection with the works a subway from the electric station to Union Street, via Queen Street. It is 2,480 feet long, is 7 feet 6 inches in height and 6 inches in breadth, and is designed to carry cables capable of 10,000 horse-power, capable of extension to 15,000 horse-power. By this method all the cables for lighting and tramway purposes can be inspected, added to or altered without interference with the street. The new station when completed will cost about 150,000*l.*, and it is expected to be finished in the course of a few months.

THE Normanby Ironworks Company have just introduced at their Cargo Fleet Ironworks, near Middlesbrough, an extensive electrical plant for the operation of the pig-iron bed crane, the pig-breaker and the blast furnace hoist, as well as for the lighting of the shops and offices. The change has been made with a view to facilitating the conveyance of the raw materials from the base level. The hoist motor is arranged to develop from 120 to 150 b.h.p. when running at a speed approximating 450 revolutions per minute. An automatic brake is fitted to the motor, so as to bring the hoist to a standstill in the event of the current being cut off either intentionally or otherwise. The liquid switch is fixed at the bottom of the hoist, and is fitted with automatic steering gear to throw the switch out of action when the cages reach a certain level without being stopped by the attendant.

### VARIETIES.

ADDITIONS to the Wandsworth Infirmary are about to be carried out. The architects are Messrs. Lansdell & Harrison, of Basinghall Street, London.

A NEW laundry is about to be built for the Hackney Guardians in the Gainsborough Road. The architect is Mr. W. A. Finch.

A NEW Oddfellows' hall in connection with the Whitchurch Loyal Good Samaritan Lodge (Manchester Unity), the richest lodge in Shropshire, was formally opened on Monday.

THE historic oak under which John Wesley preached in Savannah, Georgia, has been cut down to make room for a trolley-car track.

A NEW Baptist chapel, which has been erected at Walsgrave-on-Sowe, near Coventry, at a cost of 1,300*l.*, was formally opened for public worship on Tuesday.

THE London Parcels Delivery Company are about to erect at Eltham, Kent, a new dépôt. The architect is Mr. Henry Poston, of 39 Lombard Street, E.C., who is also the architect for the new hotel which is about to be built at Manor Park, Essex.

THE sinking of the flagging on the north side of the outer ward of Alnwick Castle, between the barbican and the old guard chamber (now the porter's lodge), has led to an interesting discovery in the exposure of the ancient moat way and the massive masonrywork on which the drawbridge rested when

lowered; also a dungeon underneath the old guard chamber. All these are in a wonderful state of preservation after being buried for so many years.

At Beverley on Sunday the Vicar referred to the new bell "Great John," which has recently been placed in the north-east tower of the Minster, stating that a heavier hammer was being prepared for it. The statues on the exterior had been completed, and the porch was now one of the finest in the country. With the exception of Lichfield, no cathedral in the kingdom was adorned by so many statues.

THE Strangeways branch of Williams Deacons' Bank was entered by burglars on the night of the 20th ult., and a most determined attack was made upon the Chatwood safe, containing the cash and valuables. Apparently the burglars worked all night undisturbed, but were completely baffled. The safe bears many evidences that the cracksmen were exceptionally well equipped and very skilful. Among other appliances a powerful oxyhydrogen blowpipe, as well as drilling tools, had been tried. All efforts to break into the safe were fruitless.

THE officers and clerks' committee of the Corporation of the City of London have fixed Monday next, the 7th inst., as the last day on which applications for the vacant office of town clerk of the City can be received. Subsequently they will meet to select five candidates for the ultimate choice of one of them by the court. Up to the present about twenty candidates have come forward, including the town clerks of Leicester, Plymouth, Croydon, Westminster, Fulham, Kensington, Shoreditch, and other provincial and London municipalities, besides others whose names have been mentioned. The salary is fixed at 2,000*l.* a year, and candidates must be under fifty years of age.

DURING the last few years a great development has taken place in the quarrying and preparation of whinstone at North Queensferry, and so much difficulty has been experienced in finding housing accommodation for the workers that Messrs. Alexander Brunton & Son have erected two rows of houses, which are already occupied by twenty-six families. Near to the houses the firm have built a hall, which, when seated for an entertainment, can accommodate 300 persons. Primarily, however, the building is intended for recreative purposes, and not only the workmen at the quarries but any of the inhabitants of the village will have the use of it on five nights a week on payment of a merely nominal subscription. Ten tables have been provided at the sides of the hall for the playing of chess,

draughts and other games, while in the centre there are ping-pong tables. The institution is to be managed by a committee chosen from the Messrs. Brunton's workmen, and formal opening took place on Saturday afternoon.

MR. HENRY PRICE, now chief of the architectural department and surveyor of buildings to the Birmingham Corporation, has been appointed the first Manchester city architect. The salary is 600*l.* a year and the duties of the office will be "to prepare all plans and specifications for and superintend the erection of all Corporation new buildings (excepting otherwise ordered), in accordance with instructions that he may receive from time to time from the City Council or the committees, to prepare plans and specifications for and to supervise the alterations and repairs to existing buildings of the Corporation, to check accounts of all moneys expended on such works, and to prepare and issue to the committees certificates of the moneys due therefor."

PLANS have been filed at the Bureau of Buildings, Manhattan, for the first Carnegie library, to be erected at Nos. 1 and 224 East Seventy-Ninth Street. The building will have three storeys and basement in front, and four storeys and basement in the rear. It will have a frontage of 40 feet and depth of 92 feet. It will cost 50,000 *dols.* The fourth storey will be used for a janitor's apartment. The design of the building is Classic, based on the Ionic order. The front is limestone. The structure will be fireproof throughout. It will be heated directly and indirectly by hot water. Special attention has been paid to lighting. The front windows will be large, and at the rear of the first floor there will be a prismatic skylight, which will extend across the entire width of the building. Besides this, the plans provide for a generous supply of gas and electric lights. The building will be equipped with two electric dumb waiters, one for the conveyance of books and the other for the janitor's use. The building will be finished in October. James B. Lord, of No. 160 Fifth Avenue, is the architect. He designed the Appellate Division of the Supreme Court building and the Delmonico building. The architect was unable to say how many books the library would accommodate, as the shelving was not part of the contract.

ST. NICHOLAS'S CHURCH, Gloucester, which was badly damaged by fire on December 2 last, having now been completely renovated, was reopened on the 23rd ult. The interior looks very clean and bright. When the roof was being attended to a great beam in the roof of the vestry was found

in a most dangerous condition, and while the workmen were it was decided to have the vestry enlarged, so that the Bible class could be held in it on Sunday afternoons. A vestry has been added, and a new entrance to the vestry through the churchyard. A low pressure hot-water system has been provided, which distributes the heat equally throughout the church. The church is now thoroughly up-to-date as regards heating and lighting—the latter being by means of electricity. Some necessary repairs have been done to and improvements effected in regard to the old organ, which, in order to enlarge the vestry, it was found necessary to move forward, and this has been done with advantage to the sound. The work of restoration and addition has been carried out carefully and with care, so that the new portions may harmonise as far as possible with the old fabric. The total cost about 670*l*.

THE new isolation hospital for the Bromsgrove, Droitwich and Redditch Hospital district has been opened. The buildings are situated on a commanding eminence at Hill Top, a district between the town of Bromsgrove and Grafton Manor. They consist of two main blocks, capable of accommodating twenty-two beds, and at the rear are two isolation blocks, divided into wards, which provide accommodation for another twenty beds. There are the usual sanitary arrangements, which consist of a capacious laundry and drying-rooms, a Threshing machine, &c., and arrangements are also made for supplying water for the whole of the buildings, steam for the distillation and dry air for the drying chamber. The administrative block consists of a surgery, two sitting and dining-rooms, general stores on the first floor, bedrooms to the number of ten on the first floor and three additional ones on the second floor. The cost of the whole buildings, including fitting out, has amounted to 13,282*l*, and is about 3,700*l*. in excess of the original estimate.

#### BUILDING AND BUILDERS.

Foundation-stones were laid on Monday of a new Primitive Methodist church to be erected in High Street, Edgbaston, Birmingham, which will accommodate 900 persons, the estimated cost of which is 4,500*l*.

A SITE has been purchased on the south slope of the Little Heath, 900 feet above sea level, and within a short distance of Keswick, on which it is proposed to erect a sanatorium for the open-air treatment of consumption.

A NEW Rowton House in course of construction in Whitechapel, containing 816 cubicles, will be completed and opened in the course of next month. There are already four Rowton Houses in the Metropolis in full operation—Vauxhall, with 484 cubicles; King's Cross, with 678; Newington Butts, with 804; and Hammersmith, with 816.

THE sewerage committee of the West Bromwich Corporation in their report state that they have considered tenders for the works necessary for the treatment of sewage by the bacterial process, and recommend the Council to accept the tender of Mr. W. Cunliffe, of Kingston-on-Thames, for construction of the works.

At a meeting of Berwick School Board on Wednesday a letter was read from the Board of Education sanctioning the erection of a new infant school at Bell Tower Close, to accommodate 252 infants, at a cost of 4,302*l*, the repayment of which is to be spread over thirty years. The architects are Messrs. Nicholson & Dotchin, Newcastle.

BUILDINGS, to cost 20,000*l*, are about to be erected on the western side of the Borough Polytechnic. One of the two new blocks will be devoted to the special evening classes for women and the work of the girls' domestic economy school. The other block will be used for the engineering and building trade classes and the boys' day school. There are now 3,465 evening students on the rolls, in addition to those attending the technical day schools.

THE great reservoirs between Ashford and Staines, whence it is understood three of the metropolitan companies—the Grand Junction, West Middlesex and New River—are to be supplied with additional water taken from the Thames above Staines Bridge, are now much advanced. After running from the intake for a mile or so along the aqueduct to the powerful pumping station near the London Road, Staines, the water will be forced into the storage reservoir, and pass thence as required to the filtering beds at Hampton, lower down the river. The works, which are being carried out by Messrs. J. Aird & Co., are of an extensive character, and have already occupied several years in construction.

THE memorial-stones have been laid of the Wesleyan new Sunday school which is in course of erection at Eastwood, Rotherham. The architect's designs for the building show a handsome elevation, with an outside measurement of 68 feet long and 53 feet broad, and the building will consist of five rooms, viz. assembly-room; two classrooms, one infants' room and one

church parlour. The assembly-room has a gallery, and the rear block has two storeys. The building will be of brick with stone front, and is estimated to cost about 3,000/.

A SPECIAL meeting of Arbroath Town Council was held on the 31st ult., Provost Grant presiding, to consider a recommendation by the gasworks and electric-lighting committee for the erection of a new retort bench on the semi-stage regenerator plan, and to enter into contracts for the execution of the work. Plans and specifications of the proposed improvements were laid before the meeting and adopted. The works will cost 2,600/.

THE Stafford Town Council have had under discussion in committee an important building scheme. The matter came before the Council in a report presented by the public health committee, who recommended the sale of building plots on the Lammascote farm. The portion of the farm which it is proposed to sell faces Weston and Tixall roads, and the principal part of the area laid out is the old cricket field. The plan of the proposed allotment was exhibited in the council chamber, and it showed the division of the land into streets with some 640 building plots, varying in size from 148 to 300 square yards. The proposal is to sell the plots outright as freehold. After considerable argument as to the expenditure that would be entailed by the scheme, the Council adopted it.

A SERIES of conferences took place on the 24th ult. between the master builders of Birmingham and representatives of the bricklayers, carpenters, masons, plasterers and plumbers, concerning the notice served on the men some time ago relating to a reduction of wages and for the unification of hours. The conferences, over which Mr. Albert S. Smith presided, were private, and lasted all day. At the conclusion, the following official statement was issued to the Press:—"The committee appointed by the general meeting of the trade held on March 20 met the several branches of operatives in conference to-day, at the Acorn Hotel, Temple Street, when prolonged discussion took place upon the proposed alterations in the working rules, with the result that, with the exception of one or two points, a settlement of the matters in dispute was agreed to. As it is not proposed to reduce the existing rate of wages, it is confidently anticipated that no difficulties will be raised by the operatives to prevent a friendly settlement."

THE finance committee of the London County Council have been considering the two new schemes for erecting dwellings

for the working classes at Preston's Road and Norfolk Street, Poplar, and Old Oak Common Lane, Hammersmith. The total accommodation to be provided on the Preston's site as proposed will consist of five-storey balcony dwellings containing 250 tenements of two and three rooms. On the Norfolk street site it is proposed to build fourteen cottages each of three rooms. The estimated total cost of the buildings to be erected on the sites amounts to 56,151/., and toward the School Board will contribute 10,359/., as 1,030 of the persons to be housed have been displaced by new educational establishments. The net capital cost, therefore, of building the two sites will be 45,792/.. The Hammersmith site consists of 50 acres of flat land to the south-west of Wormwood Street, near the Convict Prison, which will be acquired from the Ecclesiastical Commissioners at 550/., an acre. The housing managers have prepared estimates for the development of the estate, which are based on an average of twenty-five cottages to the acre. Under such a scheme of development accommodation would be provided for about 9,200 persons in 1,250 cottages of different classes. The finance committee consider that there should be a small annual surplus on the former proposals, and that the latter should cast no burden on the county rate.

### DUFFY'S WOOD-BLOCK FLOORING.

THE Acme Wood Flooring Company, Ltd., invited on the 27th ult. a numerous party of architects and others interested in such matters to Messrs. A & S. Gatti's newly decorated Adelaide Gallery Restaurant, Strand, to inspect the new flooring which they have just laid there. This flooring, which is on Duffy's patent immovable system, consists of British co. woods (1½-inch East India teak and West Australian jarrah) laid in herring-bone fashion on top of an ordinary boarded floor. In addition to the durable qualities which these woods have proved to possess, the diversity of colour which they produce produces an eminently pleasing effect.

In case any of our readers are unacquainted with the details of this particular system of flooring, the following brief particulars may not be out of place:—

The important desiderata of securing a perfect bond between the individual blocks themselves, and insuring the efficient adhesion of the block flooring to the foundation upon which it was laid are insured by means of the contrivances invented

Duffy and the *modus operandi* adopted by him. Into the concrete foundation, covered with a floating of cement, are a series of what are termed "bonding blocks," the top of the blocks being level with the cement floating. When this is thoroughly dry and hard the flooring blocks are laid upon, each separate block being secured to its neighbour by means of dowels fitting into corresponding recesses in the cement blocks. By this means a union or "bond" of the test strength and tenacity is effected, the blocks being held in position at every joint. The fit of the blocks is carefully accurate, the joints being scarcely perceptible; this is obtained by the exactness with which the special machines employed by the firm turn out the blocks of any size, the holes for the dowels or pins being bored with a similar exactitude, and thus mathematical accuracy is secured throughout—an extremely important point, as all parts of the floor are interchangeable. The appearance of the floor is laid, even in the cheapest form of deal, is excellent, and is no comparison between it and the unattractiveness of ordinary boarded floor. Also where enhanced decorative effect is required, an ornamental surface is obtained, in no way inferior to parquet.

In addition to the individual keying of the blocks together, a superposed block floor is at suitable intervals firmly secured down to the "bonding blocks," already referred to, being built into the concrete foundation, by means of screws (the heads of the screws being rendered invisible on the surface of the finished floors), thus preventing the possibility of upheaval of the superposed floor from the foundation upon which it is built. Longitudinal > shape grooves are also cut along the bottom edges at the sides of the flooring blocks, which, before being laid, are dipped into a preservative composition (while the latter is in a heated fluid or fluid state), which coats the under surface of each block, and serves as a bedding for same. This composition fills the > shape grooves, and when it sets hard forms an additional "key" or "bond." By the means above described the solidity of the floor is as complete as if constructed in one piece.

In certain cases the concrete foundation above referred to can be dispensed with, as would occur when an ordinary boarded floor—and particularly a worn or partially worn one—has to be covered with block flooring. An instance of a boarded floor thus covered presents itself in the case of the flooring of the Adelaide Gallery, as above mentioned, under inspection.

Very large stocks of timber are held by the company. Thus, on July 31 last, the value of the timber on the company's premises amounted to 174,464*l.* 18*s.* 7*d.*, as per the accountant's certificate attached dated November 7, 1901. The wood for the flooring blocks is thoroughly seasoned before being cut, and, when cut to the flooring sizes, they are seasoned in the open air for long periods. In addition, every block undergoes treatment by special process which completes the seasoning in a thoroughly efficient manner.

It is worthy of note that the company guarantee their "Immovable-Acme" system of wood-block flooring for five years.

### BRITISH AND AMERICAN BRICKLAYING.

The following letter from Mr. J. Oldham, of Manchester, has appeared in the *Times* :—

Will you kindly allow me to state my views *re* the above? As a bricklayer of twenty-five years, at present engaged in running work for one of the largest employers in England, and who has also done work for various firms in America—where I have spent upwards of seven years in many large towns from the Atlantic to the Pacific; have been delegate for a branch of the International Union of Bricklayers of America; and have done work that has terminated successfully from a contractor's point of view—I claim that I am qualified to speak of American bricklayers' work, both in quality and quantity.

Mr. Stewart states that his rate averaged in December 1,800 a day, and 2,250 for common work. Knowing many of the men Mr. Stewart employed and their capabilities as bricklayers, I assert that this was not done. In December 7½ hours only per day are worked. To lay 2,250 bricks would mean that each and every bricklayer would have to pick up five bricks a minute, to say nothing of picking, spreading the mortar, plumbing quoins, turning arches and other work outside the actual laying of bricks that go to take up bricklayers' time. Remembering that the walls of the Westinghouse are 18 inches to 23 inches thick, I admit a man can do more on these walls than on an ordinary dwelling-house, but at the same time to lay the number of bricks given in ten hours is an impossibility in the class of work given by Mr. Stewart. In spandrels between large arches, such as railway work, buttresses, piers, wide foundations, &c., where men sometimes drop trowels and place bricks in with both hands (thrown to them by labourers) on a bed previously prepared (or as is better known to the trade as

WITT & COMPANY, 168 TO 176 DRUMMOND STREET, N.W.

Telephone No 773 King's Cross. Telegraphic Address, "Veneer, London."

"larried") by labourers, this is possible for one or two successive days, but could not be regularly performed by the most efficient and physically capable of bricklayers. His American figures, to anyone who knows anything of American brick-laying, are, to say the least, characteristic of that country. Although their bricks are much lighter and smaller than ours, my experience is that nothing like the quantity stated by Mr. Stewart is ever even thought of there. Their bricks are 8-inch by 4-inch by 2½-inch, taking 1,170 to measure what 880 English ones do; so in a day's work given by Mr. Stewart 2,340 would be equal to 1,760 of ours. In working in America for what are called "front lumpers," and who pay a dollar a day more than the trade union rate of wages, every satisfaction is given when 500 to 700 bricks are set, according to the class of work. I have worked on tenements (their lowest class of work), the average on these being less than 2,000 a day, the quality of work not bearing comparison with English. Mr. Stewart is probably aware that there are very few Americans employed on face work in New York. In fact, New York has been built by Englishmen, and the most successful contractors in the class of work where it is possible for the largest number of bricks to be laid are Englishmen. Mr. Stewart puts his "success" down to three causes:—1. Good wages. 2. Good superintendence. 3. Newest mechanical devices.

What mechanical device has Mr. Stewart got that can make it possible for a bricklayer to lay more bricks than he can pick up? I also agree with him about Englishmen working equally as hard as Americans; they were able to do this before they saw America. They are always preferred by American contractors to any other.

#### ADAMANT PLASTER.

At the Warwickshire assizes the action *Bassett v. The Adamant Company* was heard. Mr. John Bassett, manufacturer of adamant plaster, Sherborne Street, Birmingham, sued the Adamant Company, Ltd., of Commercial Street, Birmingham, who are in the same line of business, for damages for libel.

It appeared that the plaintiff had been engaged in the manufacture of adamant plaster for a number of years. About 1887 the defendant company was formed for the purpose of carrying on a similar business in Birmingham; they acquired the plaintiff's concern and he became their managing director. In 1890 disputes arose, which led to the dismissal of the

plaintiff, who took proceedings against the company for wrongful dismissal. The case was compromised, the company paying him the amount he claimed. Plaintiff then formed a company with his brother, and continued to manufacture adamant plaster, for which they obtained patent rights. Later on that company ceased to exist, and the plaintiff went into business on his own account. In 1901, through a communication made to him at Llandudno, it came to his knowledge that the defendant company had published a circular which contained the words complained of, as follows:—"As we are the only manufacturers of adamant plaster in the kingdom, and the sole owners of the patents for its production, you will be doing a great service by giving us information that might lead to the discovery of the persons who have practised or made attempt to practise the deception of supplying a material supposed to be adamant plaster, and so enable us to protect the public from the fraudulent use of a worthless article."

Mr. Soall, secretary of the Master Plasterers' Association, said he knew of no other firms than those of the plaintiff and defendant who manufactured adamant.

Mr. William Smithies, president of the National Association of Master Plasterers, said he considered the paragraph in question referred to the plaintiff.

Other evidence of a similar character having been given by Mr. Hugo Young opened the case for the defence. He contended that there was nothing in the circular to indicate plaintiff, and pointed out that in a practical sense the plaintiff was not the only manufacturer of adamant. The reason for publishing the circular was that the defendants found that where it was intended their adamant should be used in buildings, other materials were being substituted. It was not intended to indicate the plaintiff in the circular in question.

Mr. John Wilkinson, managing director of the defendant company, said the paragraph was not intended to refer to plaintiff, but in cross-examination he admitted that the other manufacturers of adamant in Birmingham were the plaintiff and the defendant company.

Re-examined: He never knew the plaintiff's adamant without the qualifying word "Bassett's."

Mr. J. H. Cartland, chairman of the defendant company, also gave evidence.

The jury found for the plaintiff, with 100% damages.

Mr. Amphlett applied for an injunction, when defendant's counsel undertook to remove the offending portion of the circulars in their possession, and not yet issued.

## TUNNELLING IN LONDON.

the last meeting of the Institution of Civil Engineers the papers read were "The Greenwich Footway Tunnel," by Mr. C. Copperthwaite, M.Inst.C.E., and "Subaqueous Tunneling through the Thames Gravel: Baker Street and Waterloo Railway," by Mr. A. H. Haigh, B.Sc., M Inst.C.E.

The Greenwich footway tunnel was the second tunnel beneath the river Thames undertaken by the London County Council with a view to improve the means of communication between the districts lying north and south of the river and east of the Tower Bridge. It was intended to replace the existing steamboat ferry between Greenwich and the Isle of Dogs, to the working of which, in a crowded waterway like the Thames, there were serious objections and hindrances. The work had been commenced in June 1899, and was now nearing completion.

The subway consisted of a cast-iron tunnel 12 feet 9 inches in diameter, connecting two shafts 43 feet in internal diameter and 1,217 feet apart. One of these shafts was situated in the East Gardens, Poplar, the other being immediately behind the Ship Inn at Greenwich. Access to the subway was provided by lifts and circular stairways.

The tunnel was similar in character to other iron tunnels recently built in London. From each shaft it dipped towards the centre of the river with a gradient of 1 in 15, the middle line being on a gradient of 1 in 277, falling towards the Greenwich shore. These gradients were entailed by the advisability, from motives of economy, of limiting the depths of the shafts, and by the necessity of complying with the stipulation in the Act that the level of the tunnel should be such as to avoid dredging a channel in the river 500 feet wide and 4 feet deep at high water.

The caissons were 35 feet in internal and 43 feet in external diameter, and were formed with two steel skins, the 4-foot space between them being filled with 6 to 1 Portland cement concrete. The skins were formed of horizontal rings built up of plates, which were generally about 4 feet 9 inches in depth and 1 inch in thickness between  $\frac{1}{2}$  inch at the bottom of the caisson and  $\frac{1}{4}$  inch at the top. After describing generally the shafts, the author pointed out that their special features were the absence of any taper on the outside of the caisson and the pro-

vision of two air-tight floors, the one permanent and fixed immediately above the cutting edge and the other temporary and fixed above the tunnel opening. The sinking of the caissons, which had been done under compressed air, had been greatly facilitated by these arrangements, and had been effected with very uniform progress, and without any disturbance of the surrounding ground.

During the sinking of the caissons the opening in each shaft for the tunnel had been closed by a "plug" formed of steel plates fitted between girders in such a way as to be removable singly when the shield was ready to start. The operation of removing this steel plug by gradually substituting, 4 feet behind it, a timber diaphragm, and filling the space between this diaphragm and the face with pugged clay, was briefly described.

The cast-iron lining was similar in character to that used in previous works of the same kind, but some improvements had been made in details to obtain better water-tight joints. All bolt-holes were made with a short portion bevelled off, and when the bolts were put in lead washers were put on them, and on the bolts being screwed up the lead completely filled the space round the bolts at each end made by the bevelled edges of the bolt-holes. This arrangement had proved very successful, and comparatively few bolts had been found to be leaking when the air-pressure was removed. Into the joints between castings soft lead wire was hammered before caulking. The shield was of the "trap" or "box" type. The author gave a short account of the evolution of this form of shield, with diagrams of successive shields built on this principle. The one used for the Greenwich Tunnel was 14 feet 6 inches in length, and had an external diameter of 13 feet. The cutting edge was made in thirteen segments, each segment having two 6-inch teeth cast on it, and immediately behind the cutting edge was a circular built box girder. Certain alterations suggested by experience had been made in the shield, the nature of which was fully described in the paper, as well as the method of tunnelling, which differed from previous similar work only in the use of face-rams for holding up the timbering of the face. The rate of progress had been exceptionally rapid, an advance of 10 feet per working day having been made over all the tunnel except a short length in open ballast on the Greenwich side. This the author attributed mainly to the favourable character of much of the material excavated.

After giving some general statistics as to the health of the

& S. FOLDING GATE CO., 19, 20 & 21 Tower Street, Upper St. Martin's Lane, London, W.C.

men employed, the author described an arrangement for drawing vitiated air from the working-front of the shield. An attempt had also been made to eliminate the carbonic acid from the air supplied to the tunnel by means of caustic soda. With this object an apparatus consisting of boxes or rectangular tubes of wood, one above the other, open at one end, and having sliding doors at the other end, had been devised. The ends fitted with doors were connected to the air-inlet of the tunnel by a conical box, the connection with the air-pipe being made air-tight by a flexible joint. By opening one or other of the sliding doors the air could be made to pass through either the upper or the lower tube as required. These tubes had removable sides, and each contained eight movable wire boxes containing pumice-stone broken small, which, before being put into the tubes, were dipped in a saturated solution of caustic soda. A table of results was given, showing some reduction to have been made in the proportion of carbonic acid present in the tunnel.

The second paper described the work of tunnelling under the river Thames for the Baker Street and Waterloo Electric Railway.

In passing beneath the Thames the tunnels, elsewhere wholly in London clay, encountered a bed of clean gravel and sand lying in an abrupt depression of the clay surface. This freely water-bearing bed had necessitated construction under compressed air. The two tunnels, each for traffic in one direction, ran parallel and on the same level for a short distance under the river from the Victoria Embankment at the bottom of Northumberland Avenue, after which the east (up) tunnel had a rising gradient of 1 in 111, and the west (down) tunnel a falling gradient of 1 in 107 towards the south side of the river. On passing under College Street the up tunnel was vertically over the down tunnel.

The temporary stage, from which the working shafts in the river had been sunk, was constructed on piles, parallel with the Embankment and 150 feet away from it. From this stage a temporary foot bridge led to the Embankment. A stage, 370 feet by 50 feet, held the contractors' plant and necessary buildings. Two 16-feet shafts having been sunk, tunnelling northward had been begun from one of the brick chambers at the bottom in February 1899, but southward the river work had been begun in March 1900.

The shield for tunnelling through the gravel was provided with a hood in front to cover the men during excavation, and a fountain trap behind, to afford an air-seal against a hori-

zontal water surface, should a run of water at the threaten flooding of the tunnel. Under the forward top of this trap, which was close behind them when working, the miners could escape in case of necessity. The application had proved perfectly successful in accomplishing its purpose. Laterally the shield was divided into two halves, ahead of the trap, by a vertical girder, which enabled a limited face in half to be attacked, after any accident to the face-plan due to a "blow." The other essential features of the shield were a steel cylinder, stiffened by a circular box-girder in front of the hood, and having behind that a strong ring of cast-iron carrying fourteen hydraulic rams. The cylinder extended behind the ram, forming a tail in which each tunnel ring was built.

The iron lining for the 12-feet tunnels consisted of rings 18 inches in width. The tunnel was constructed with continuous longitudinal joints, machine faced, and dressed with a mixture of red lead and Stockholm tar before being erected. The joints were caulked with iron-rust cement, and both ends were grummetted where necessary. Blue lias lime grouting was forced through the tapped holes provided in the iron, which were then screw-plugged. For regulating the driving of the shield, plumb-bob lines for the tunnel centre, graduated steel rods drawn by the shield over fixed index marks square to the centre line, a hanging plumb-line in the shield casting in boning-rods behind the shield had afforded every means of determining its position and information for applying the necessary rams in driving, each ram working independently. Setting-out lines had been taken from a 15-feet 6-inch shaft transferred down the shaft by steel wires.

Tunnelling towards Waterloo had been begun at the surface with 17 feet of solid clay and 34 feet of total cover beneath the river-bed. In April 1900 the 8-feet solid air-tight diaphragm wall of brick in Portland-cement mortar had been built across the tunnel and grouted under pressure, with the working in lock and an emergency lock through it, and all necessary precautions. When the clay cover of the shield was only 5 feet thick, the heading in advance of the shield had been discontinued. Compressed air had then been applied with 5 feet of clay covering at a depth of 18 feet below the river-bed. As soon as the cutting edge reached within 2 or 3 inches of the ballast, pocketed pugged clay had been made, close to each other, in advance of the face, forming a soft bed for the skin to enter, wherever the cutting edge would otherwise have encountered the ballast. As the amount of ballast face increased, the handholes, separately excavated and filled, had formed a larger and larger

ion of an annular bed in front, a close blanket against the  
id-skin behind, and a lining to the ballast over the iron  
nel, securing a space for the grout around the iron, and an  
eal at the tail of the shield where it covered the last tunnel  
The face had been timbered with close horizontal  
king set against a thick plaster of pugged clay, and  
nged by stretchers in two halves, across the face, held at  
against the shield, and afterwards held by up-and-down  
iers, supported by round hollow steel struts passing through  
shield, when driving the shield forward. The normal pro-  
s of the tunnel in ballast had been three 18-inch rings per  
Three eight-hour gangs had been employed. The air-  
sure used had been the exact equivalent of the hydraulic  
l in the river, varying usually during each tide between  
s. and 32 lbs. per square inch.

Medical attendance had been provided for the workers, and  
y provision had been made for their care. Cases of com-  
ed air sickness had been infrequent, and the serious ones  
The amount of air at atmospheric pressure pumped  
gh the tunnel had varied between 30,000 cubic feet and  
oo cubic feet per hour. The proportion of carbonic acid  
ne atmosphere in the working space had varied between  
per cent. and 0.10 per cent.

he East Tunnel had since been driven through the ballast  
e use of the same shield, with a slight modification to  
le the miners to work conveniently while the face was kept  
ether under cover of the hood. An average progress of  
5 feet per working day had been uniformly maintained,  
the amount of air delivered had averaged only 100,000  
: feet per hour.

### DUNFERMLINE'S NEW BATHS.

new baths and gymnasium which Mr. Carnegie has  
nted to Dunfermline will occupy a site on the east side of  
ur Street, along which they extend 260 feet. The main  
is composed of a centre block of two storeys, flanked  
ctively on the right and left by buildings, each of single  
y; and on the extreme left the elevation is extended in a  
ate composition of simple design, forming a group of  
ish baths in two storeys. The central block contains the  
ce hall and a spacious vestibule, on either side of which  
e ticket office and a ladies' room, with costume and shoe

store. Facing the entrance are the main entrances to the pond  
hall on the left and the gymnasium on the right. Both of these  
are behind the main building. The pond hall is a handsomely  
equipped and well-lighted apartment, 92 feet 6 inches by 58 feet  
6 inches, containing swimming pond, 75 feet by 35 feet, also  
two commodious spray-rooms and an instructor's room. On  
each of the two sides of the apartment there are upwards of  
fifty dressing-boxes, and by an ingenious arrangement of hinging  
the box divisions are made to fall aside, and, the side floors  
being staged, the space can be seated for an audience, on gala  
occasions, of about 350 persons, in addition to 400 more pro-  
vided for in the gallery, which is carried round three sides of  
the hall. The gymnasium is a lofty and well-lighted apartment  
103 feet by 45 feet, with a gallery on three sides. Provision is  
made in it for the introduction of all the latest appliances for  
the gymnastic exercises for both sexes. On one side of the  
gymnasium are separate dressing and spray-rooms for the  
sexes, with an additional apartment on the basement floor to  
be used as auxiliary accommodation on special occasions if  
required. The entrance and exit for these apartments are so  
arranged as to secure perfect privacy to each of the sexes  
in passing to and from the gymnasium. In the front building  
to the left of the centre block is the section comprising the  
slipper baths. It is arranged for fourteen plunge and nine  
spray baths, each with a separate dressing-box, the whole  
being grouped in a lofty and well-lighted apartment, but  
with separating passages for the attendant controlling the  
baths under use. Special appliances for ventilation, and  
radiators for heating, are provided throughout. The Turkish  
baths immediately adjoin. They comprise the usual succession  
of hot, shampooing and cooling apartments, Russian vapour  
baths and plunge pond, all being of liberal dimensions and  
fully equipped. To the right of the centre block is a large,  
handsome billiard hall, accommodating three full-sized tables,  
together with oriel and ingle-nook recesses for table games.  
The hall is furnished with a separate lavatory, which is ap-  
proached immediately from the main entrance, so that those  
engaging in the game may not be required to pass the turn-  
stiles placed for ticket-holders to the baths. Committee and  
reading-rooms are provided above the entrance hall in the  
centre block, and over the gymnasium dressing-rooms is a  
commodious residence for the caretaker, who by private pass  
doors has through communication to all parts of the building.  
Under the Turkish-bath blocks are engine and boiler-house  
for heating and hot water supply throughout, and for the

generation of electricity for lighting. There are also wash-house and laundry, with special drying-closet, and an engineer fitter's workshop. A special "Sturtevant" heater for Turkish baths is likewise accommodated on this floor. In maturing the plans, the most modern baths in various parts of the country have been visited, and useful information gathered and applied, so as in every way to make the result worthy the generous donor, and up to all the full requirements of the town. The buildings are designed in a simple phase of Renaissance, and promise to result in a dignified and appropriate composition, the whole being faithful to the arrangements of the plans. The stone used will be from Swallowdrum, a well-known local quarry. Internally the finishings will be of a tasteful, appropriate and durable quality, tinted enamelled tile and brickwork being judiciously disposed where plaster would be unsuitable. The total cost of the structural works is 27,000*l*, being somewhat under the original anticipated estimate. The architect is Mr. Hippolyte J. Blanc, R.S.A., F.R.I.B.A., Edinburgh.

### MANCHESTER AND SALFORD SANITARY ASSOCIATION.

WITH the object of commemorating the fiftieth anniversary of the formation of this Association, its committee has decided to hold a conference on sanitary reform. It will take place in the Town Hall, Manchester, on April 24 and 25, and from the programme just issued the meetings promise to be highly interesting. After the welcome to members on the first day the president of the Association and of the general committee of the conference (the Bishop of Manchester) will deliver an inaugural address. This will be followed by an address on "The History of the Manchester and Salford Sanitary Association, or Half a Century's Progress in Sanitary Reform," by Dr. Arthur Ransome, F.R.S., a former chairman of the committee. Sir James Crichton-Browne, M.D., F.R.S., will next speak on "Light and Sanitation." The next meeting will be devoted to "Women's Work in Sanitary Reform," on which subject Mrs. H. J. Tennant will speak. "Vital Statistics and their Relation to Sanitary Reform" will be dealt with by Dr. Arthur Newsholme, medical officer of health, Brighton. Mr. T. C. Horsfall, president of the citizens committee for the improvement of the dwellings and surroundings of the people,

will read a paper on "The Housing Question." An address on "The Prevention of Tuberculosis" will be delivered by Wm. H. Broadbent, M.D. Dr. A. Bostock Hill, professor of hygiene and public health at Birmingham University, will deal with "The Relationship of Voluntary Effort to Constitutional Authority in Promoting Sanitary Reform." The Earl of Meath will speak on "Physical Training;" Dr. Niven, medical officer of health, Manchester, on "The Economics of Health." Amongst others who will preside at meetings are Professor Dixon Mann, M.D., present chairman of the Association; Wm. H. Houldsworth, Bart., M.P.; Mrs. Moorhouse; Henry Simpson, a former chairman of the committee; Alan Walton Smith, J.P., chairman of the sanitary committee, Manchester Corporation; Mr. W. J. Crossley, J.P., C.C.; Mr. A. Hopkinson, K.C., principal of the Owens College; the Right Worshipful the Mayor of Salford; Sir J. T. Hibbert, K.C.B., chairman of the Lancashire County Council; and Councillor Huddart, chairman of the Salford health committee.

The address to be delivered by Dr. Ransome, who was one of the earliest members of the committee, and who served many years as honorary secretary and chairman, will be an appropriate record of the work which has secured for the Association that recognition from local authorities and other public bodies directly or indirectly associated with public health administration which has procured for it the influential position it has long held. The Association has not only been the pioneer of most of the important sanitary improvements in Manchester, but has exerted marked influence in sanitary legislation. Its influence with Government departments is illustrated in its report for the past year, and its communications to local authorities surrounding its immediate sphere of operations are always treated with high respect. It is natural, therefore, that its infrequent conferences should attract the attention of such authorities, and on this occasion in particular the desire seems to be general to recognise the unique position of the Association as the oldest health society in the kingdom. Many municipalities, urban district councils and other public bodies have appointed delegates, or intimated that they will be otherwise represented. All local institutions having any connection in common with the Association are represented on the conference committee, including some which are the direct offspring of the Association. As in the case of former conferences the proceedings of this one will be published, and the volume should prove a valuable contribution to sanitary literature.

**HIGHEST AWARDS:**  
**EXHIBITIONS 1891-93-94-95-97.**

Twice Awarded the Royal Photographic Society's Medal for  
Architectural Photography.

Telegraphic Address, "Bolastype, London."

# The Architect.

## THE WEEK.

THE munificence of Mr. CECIL RHODES will no doubt be shared in hereafter by some of the sixty colonial scholars who will be destined to follow architecture, and some of the American and German scholars may also turn their attention to the same art. It is evident, however, that Mr. RHODES was captivated by the Oxford notion that so long as professors are forthcoming it does not matter what kind of buildings they teach in or whether they hold forth in the open air. Otherwise, it is remarkable that he should think of sending nearly two hundred additional students to Oxford without allowing a penny to be expended on a building for their use. He may have believed that if a similar number of English students were withdrawn from the University, no loss to the world would arise. Mr. RHODES was a representative man of the present age; but it has been said that he would have desired to be ranked among learned Englishmen. Did he contemplate that his colonial, American and German students would have a like position? If he wished to make them deal with the problems of the future, science rather than literature should be their province, and in that case laboratories of various kinds should be provided for them on a scale which the University of Oxford will never erect or approve unless under compulsion. After hinting that the priorities of Oriel are fools, he directs that they are to expend 22,500*l.* on college buildings, while 17,500*l.* is to be applied to meet any loss of revenue sustained by pulling down property for the buildings. It is anticipated that the rest on that sum will not be equal to what is now recovered from the shops which will have to be removed. Mr. RHODES's trustees are to erect or complete the monument to men who fell in the first Matabele war at Shangani, in Rhodesia, the bas-reliefs for which are being made by Mr. N. TWEED. Eight thousand pounds per annum is reserved for the cultivation of the Inyanga property, but the sum is to include the establishing and maintenance of an agricultural college, besides experimental farming, forestry, market and other gardening, fruit farming and apiculture. His own house, De Groote Schuur, near Capetown, with all furniture and other articles, and all other property belonging to him situated under Table Mountain, is to be retained for a residence for the Prime Minister for the time being of the Federal Government of the States of South Africa. Until there shall be such a Federal Government it may be used as a park for the people. He gives a salary of which the interest will amount to 1,000*l.* per annum, for the keep of carriages and servants and the upkeep of the household.

THE strength of the terracing on the ground at Ibrox, in a south-western suburb of Glasgow, on Saturday, of course, was subjected to official investigation. The terrace has been in use for a couple of years, and as it was planned to accommodate 86,500 people, it is to be assumed that provision was made for sustaining the weight of an additional number. On Saturday the spectators on the western portion of the stand were over 33,000, and, apparently, if not overcrowded, more people were present than could see the playing with any approach to comfort. In the accident there seems to have been overloading in parts of the terrace, and in the eagerness to witness one phase of the struggle between the English and Scottish football teams, it is probable that some of the paving was broken, and, as the weight continued, the terrace was quickly increased until a part measuring 80 feet by 3 feet was opened. In all such cases it is impossible to provide means of control over spectators. Unless there is a system to be mutually accommodating, and for late comers to be satisfied with partial views accidents are almost inevitable. The catastrophe should bring about a revision of the data for calculating the strength of such structures. It is not sufficient to consider a crowd as a dead load, weighing so much per superficial foot. It is evident from what happened at Ibrox Park that a crowd can become a force which is destructive from its action. On that account we should expect the authorities will insist on more than the customary

strength in the stands which are to be put up in the Metropolis for the spectators of the Coronation processions. When so disciplined a people as the inhabitants of Glasgow can under excitement act unwisely, what is to be expected of a miscellaneous crowd including women and children and foreigners?

MR. PETER GRAHAM has so long delighted visitors to the Royal Academy by his paintings of Scottish scenes, his admirers in England will be pleased to learn of his acceptance of an honorary Academic Doctorship from the University of St. Andrews. Professor LAWSON, the dean, described the artist's works in words which will be endorsed in England, and deserve to be recorded. He said:—"In Mr. PETER GRAHAM, R.A., I present to you not only a near neighbour, who lives as it were under the shadow of our tower and has a keen interest in our concerns, but a famous artist of the highest excellence, who has had the rare good fortune by his pictures at once to delight the masses of the public and to please the more critical circle of his fellow-artists. Mr. GRAHAM was admitted an Associate of the Royal Scottish Academy at the early age of twenty-four, and after painting many pictures of pre-eminent merit he was elected an Associate of the Royal Academy in 1877 and an Academician four years afterwards. It has been his privilege to accomplish in art two undertakings of the highest importance. He has revived national interest in landscape painting and intensified the national character of Scottish landscape work. He has also added to it something which has come from the spirit of the romantic poetry of the early nineteenth century, a love for the pictorial effects of light and atmosphere as well as of colour. Like the greater Scottish poets of an earlier time, whose work he continues in the kindred province, he has a genuine love for all that is characteristically Scottish in hill and stream, sea coast and moorland, and, like the poets, he has linked his pictures of Scottish scenery with the humbler life of the field and of the air, as well as with the strenuous labour of men whose presence gives to nature its complete significance. Not the least of his merits is that in a day overflowing with theories of art he has been sparing of theory save by the way and to encourage a brother artist. He is happily contented with continuous artistic production for the enjoyment of his fellow-countrymen. Typically Scottish in his choice of subjects, which are treated with incomparable fidelity and alive with beauty and strength, Mr. GRAHAM is fittingly selected for honour by our University, which perhaps more closely than any other is bound up with Scottish sentiment and history."

THE resignation of Mr. W. A. VALON, who has been an engineer for the gasworks and waterworks of Ramsgate, in order to devote himself to practise as a consulting engineer, will not, it is to be hoped, deprive the town of the benefit of his experience. If at the present time the character of Ramsgate is improved by means of the communication by which the two cliffs ceased to be independent, the credit for the work must be in a large measure assigned to Mr. VALON. Attempts were made from time to time to unite the east and west cliffs, but all the projects had weak points, which were fatal to their adoption. Mr. VALON by his tact was able to overcome the opposition of the Board of Trade, the harbour authority, as well as the objections of property owners and others who had an interest in keeping things as they were. The success of the first part of the work led to the completion of the undertaking. The water supply of Ramsgate was so peculiarly arranged that the inhabitants of the higher districts of the town could not, before Mr. VALON's arrival, obtain a supply until the cisterns in the houses of the lower part were filled. Since 1879 there has been a constant instead of an intermittent supply, and the quantity has been increased almost threefold, while the profits have been nearly doubled. When the gasworks were purchased by the Corporation in 1877 the quantity produced was about 55,000,000 cubic feet; in 1901 it had grown to over 227,000,000; and the works are equal to the production of over 300,000,000. Prepayment meters have been in use during the last ten years, for Ramsgate was the first town to adopt them. The total net profit between 1877 and 1901 has been 77,774*l.* Ramsgate should hold the man in respectful remembrance who has done so much for its welfare.

## FIFTY YEARS AGO.

AT the beginning of the year 1852 anticipation had full scope for its exercise in England. The Great Exhibition of the preceding year elevated industrialism to a height which had not hitherto been attained amidst the nation of shopkeepers. The favourite food of Englishmen, no doubt, was more prized when it was reported that a loin of beef had been knighted, and in 1851 a colossal shop was found to be more attractive to royalty than any collection of works of art or curiosities which was then known. The Sovereign had inaugurated it, her husband was considered to be its chief organiser, an archbishop had prayed for a blessing on it, and poets sung its praises. As old warriors like WELLINGTON and ANGLESEY had walked arm in arm through the courts, it was allowable to assume that henceforth the great victories were to be gained by Peace, and all who took part in the manifold productions of this country could well imagine that a new golden age had arrived. The state of feeling at the time may be judged from a declaration which was issued by the Royal Institute of British Architects, of which EARL DE GREY was then president. It says:—

Among the recent movements of the present age is the exhibition of the Products of the Industry of all Nations, which was opened in the Metropolis, under the enlightened direction and zealous patronage of His Royal Highness the Prince Consort, during the past year. A Royal Commission was appointed to mature the arrangements for this noble project, which embraced a vast variety of objects connected with architecture, artistically and constructively. Considering the important influence which the exhibition must have in many departments of architecture, and desirous of evincing a hearty co-operation in so useful a scheme, fostered by our royal patron, this Institute was the first among scientific bodies to come forward and contribute from its funds to an object so national and so advantageous. This Institute cannot but feel that, great as has been the advance of this country in all matters connected with manufacturing skill, still there is to be desired a more intimate union of fine art in design in the productions of various departments. The Institute may confidently expect, however, that the noble competition recently opened between British and foreign talent will not only call forth a vigorous effort and great exertions in our countrymen for improving the tasteful products of our manufactures, but that we may look forward with confidence to a marked advance in art, as applied to articles of everyday use by even the humblest classes. The exhibition of foreign taste and skill must also have the important result of affording us useful lessons, and of hastening on the period when the English will not tolerate any production which may betray incorrectness of design, crudeness of form, or want of harmony in colour. The advance which recent ameliorations in the excise laws, and a growing taste for the beautiful have produced in glass, in mosaics, in porcelain and other objects of decoration applied to construction, must materially promote a steady progress in the right direction. This may lead us to hope that, ere long, England may vie with France and Italy in wedding the refinements of colour and material, and the attractive efforts of a less sparing embellishment to forms which Greece might have approved, and which Roman or Mediæval art could not have excelled.

On the whole, as was admitted by foreign critics, Great Britain had succeeded fairly well in the international competition. Other nations were possessed of experience in preparation for such displays, and therefore knew how to select objects which would be most effective. In this country we are sometimes disposed to undervalue our work, and there was no hesitation about praising the superiority of the foreign productions. At the same time there was a general resolve to overcome the defects which were thought to cause the inferiority of the British products. The principal differences were believed to be connected with art, and with that object the question of education in design for manufactures assumed importance for the first time.

The Government School of Design had been, it is true, in existence from 1837. The head masters were then J. R. HERBERT, R.A., R. REDGRAVE, A.R.A., and H. J. TOWNSEND, an able artist who afterwards mysteriously disappeared from London. The second masters were R. BURCHETT, W. DENBY, C. J. RICHARDSON, architect, R. W. HERMAN and W. H. DEVERELL. R. N. WORNUM was a lecturer on ornament, and the secretary was W. R. DEVERELL. There was another school of design in Manchester, of which Mr. J. A. HAMMERSLY was the principal.

There were branches in Spitalfields, Birmingham, Coventry, Nottingham, Norwich, Sheffield, Stoke, Hanley, Leeds, York, Huddersfield, Newcastle, Glasgow, Paisley, Dublin, Belfast and Cork. But prior to 1851 the schools were valued.

A rival to the Somerset House school was the National London School of Drawing and Modelling, which was established for the instruction of workmen employed in casting and chasing of metals, masonry, carving, plaster, cabinet-making, house painting and decorating, &c., and true knowledge of form as applicable to the designs, in which natural objects are introduced. FORD MASON, BROWN, Professor DONALDSON, GEORGE GODWIN, GEORGE TRUEFIT and MATTHEW DIGBY WYATT were among the committee, and the master was W. CAVE THOMAS. The fees in the Government School were 2s. a month for either morning or evening classes. In the Camden Town School the fees for adults were 2s. a month, but for youths between twelve and fifteen they were 1s. 6d. Although deprived of the prestige and the prizes available for students in the Somerset House School, the unofficial school was recognised as being able to produce designers and craftsmen who could be described as practical.

It was perceived by the Government that school design of the character then existing would not realise the expectations of the public, who wished to be at least on an equality with foreigners. It was therefore resolved to establish a department of practical art under the Board of Trade. HENRY COLE was appointed superintendent of the business of general management and RICHARD REDGRAVE art superintendent. W. R. DEVERELL became secretary. The head masters at Somerset House were entrusted with the direction of the instruction in the central school, which was also to be rendered useful to the branch schools. One of the consequences of the new arrangement was the resignation of J. R. HERBERT, R.A., who was the principal official. The two superintendents lost no time in preparing a statement to the Board of Trade, in which they appealed for public sympathy, saying, "It is obvious that unless the public as consumers are sufficiently educated to appreciate improved art in manufactures, it will not be the interest of manufacturers to aim at its production, and the labours of this department must be in some measure fruitless."

In order that technical art might be taught, OCTAVIUS HUDSON, who was one of the early pupils of the School of Design, was constituted professor for textiles and paper-staining, and GOTTFRIED SEMPER, the architect, who was a political refugee in this country, for ornamental metalwork. The schools were also removed to Marlborough House, which was temporarily assigned to the new department. One of the difficulties which presented itself was the reduction of books adapted for the use of the students. The publishing trade was then more restricted and united than it is at present, and any interference with the business would be opposed by "the trade," who could easily raise a party question of an invasion of Paternoster Row. Accordingly HENRY COLE sent a diplomatic letter to various publishers in which he said:—"Assuming that the manuscripts of such works, together with any illustrations, will be produced by this Department, will you have the kindness to inform me what you consider would be the most desirable course of proceeding to cause the works to be printed and published:—(1) So as not to interfere with the ordinary rules and channels of trade; (2) so as not to confer any monopoly on any particular publisher without previous competition, if possible; (3) so as to afford the public the means of obtaining the works at a reasonable and moderate price? In suggesting any plan, will you have the kindness to bear in mind that it will be necessary that the Department should have, for its own use only, 250 copies at the cost of paper and print?" After negotiation the firm of CHAPMAN & HALL brought out such books as treatises on geometry and perspective, and on the characteristics of the styles of ornamental art. It will be seen from the preliminaries we have described there were strong grounds for the belief that the Government was earnestly desirous to improve the teaching of art in this country. We need not now, however, discuss to what extent the hopes of the public were realised. Afterwards, when the Department of Practical Art was allowed to degenerate

in accordance with other Government departments, the signs of the time were at once exhibited.

In addition to being used for classrooms, Marlborough House was utilised for an exhibition of various examples of industrial art which had been purchased from the collection in Hyde Park. The works produced in the schools of design for the year ending March 1852 were shown, in order that the character of the teaching could be understood. Another exhibition, and one which was most valued at that period, consisted of examples in which the fine arts of art were neglected. It became known as the "Gallerie of Horrors." The offenders, however, invoked the aid of the law, and as it is disposed towards the side of money-making rather than of art in the form of theories, the collections were prudently withdrawn. But OWEN JONES was able to deliver a course of lectures on false principles of design, as well as on those which were true. Drawings from the schools were submitted to Sir EDWARD EASTLAKE, the president of the Academy, and JOHN RUSKIN, R.A., and they declared that considerable progress had been made in most of the schools. It could be said that the new system started under favourable conditions.

The statement of the Institute of Architects which we mentioned referred to the important influence which the exhibition must have exercised in many departments of architecture. Was there any sign of architectural improvement manifest during the year 1852? A paper was read at one of the meetings of the Institute of Architects by J. W. RUSKIN, at the end of which he asked the pertinent question, "What good has our profession derived from the exhibition?" The answer he gave was that the critics of the daily press had discovered for the first time that the age of foreign superiority in arts was a mistake, and had at last recognised the fact that the examples of English skill—alike in carving in wood and stone, in metal-work of all sorts, in woven fabrics and embroidery, in stained glass and mosaics—were of such a character as at last to refute the often-repeated fallacy that the English people were deficient in taste, while the truth was they were simply very much neglected it. A reply of this kind could not have caused much satisfaction to architects. In the exhibition of 1851 there was no special department of architecture, sculpture being the only fine art which was shown on a fair play, and the one architect who could be considered as having an opportunity to assert himself was JOHN RUSKIN, for the Mediaeval Court was his work. Unhappily he died in September 1852. His illustrious but most productive artistic career shortened life, for he was only in his forty-first year when he died at Ramsgate. If he had lived he might have secured many more commissions, but it is open to doubt whether his skill would have accomplished works surpassing those of his early manhood.

The records do not bring before us many remarkable examples. In the Academy HARDWICKE was represented by the office-room of the Paddington Hotel, the Freemasons' Hall, and St. Coloma's College, Rathfarnham, and JOHN SMIRKE by the gates of the British Museum. JOHN RUSKIN sent his first design for the Abbey gateway in the Broad Sanctuary. The father of Sir E. J. RUSKIN sent an interior of a new entrance hall at Pynes, Mr. AITCHISON, jun., the Palatine Club. In the Architectural Exhibition a much truer indication of the state of architecture was said to be given than in the room at the Crystal Palace. Among the designs shown was a design by C. FOWLER for a colossal arch of masonry over the Avon at Clifton, the abutments containing vaulted houses and cellars communicating with the wharves, and arched galleries over and on the spandrels for public use. E. L. WALTERS contributed warehouses in Manchester, Mr. FERGUSSON sent drawings of Indian temples, Mr. RUSKIN and Mr. J. P. SEDDON Venetian scenes. EDGESTON, jun., the secretary of the Architectural Association, showed a cottage in which iron framing was filled in with slabs of rough clay covered with a very fine coating of porcelain clay, and then glazed.

The Architectural Exhibition was believed to be promoted by the Architectural Association, and in consequence there were many senior architects who held aloof from it. At the opening meeting of the Association for the session

we find Mr. EDMESTON lamenting the difficulties under which architectural students of that day laboured. He also spoke about the everlasting subject of style, and the following will show how far views on the subject in 1852 correspond with those in 1902:—

Time was when fashion, not principle, governed architecture—when it was a purely imitative, not an inventive art. The Elizabethan is no longer the rage. We have had a rage—the Gothic; but under the new influences how different to former imitative efforts. They failed, indeed. Far different the result achieved by those many active, zealous, intelligent minds brought to bear, not on the best mode of exactly repeating something already existing, but in searching out undiscovered principles. And the more this is done and the more it is felt we see the imitative habit thrown off and the inventive faculty called into active action, so that now there is hardly any Gothic church erected which can be pointed at as copied from any example—at least, not by any of the masters in the art. The mass is unfortunately not yet so well instructed but that in some—in many—cases the matter is entrusted to ignorant and imbecile hands. Mr. Dickens finds fault with those who "have put back the hand on the clock-face of time," and a talented lecturer is so far carried away by his identity with the present as to designate Gothic architecture a "galvanised corpse;" a venerable body it may be, yet alive with meaning, principle and science. Let us not forget the immediate and excellent subject it furnished at the right moment for the spirit of investigation, and the discovery of principles which, so far from being exhausted, still offer an almost entirely unworked field for invention. The habit thus once engendered will become fixed, and the art will insensibly leave its leaning-post and learn to run alone.

It was considered by some critics that a corrective for the admiration by Mr. RUSKIN and his followers of Venetian and ultra-Gothic buildings was furnished by the investigation of the Athenian principles of architecture by Mr. F. C. PENROSE, which was published by the Dilettanti Society. It was demonstrated in the most convincing way that the horizontal lines of the Parthenon were set out as curves. It was no doubt a great discovery, but it cannot be said it has been utilised for modern practice. Mr. PENROSE was busy in writing in 1854. One of the papers he read was on the appropriate decorations of St. Paul's, in which he stated that the restoration of the cupola with chiaroscuro with a very large amount of gilding was about to be undertaken. He thought chiaroscuro-decoration should also be introduced in the apse to supplement the gilding. The three small cupolas with their spandrels similarly required chiaroscuro and a great deal of gilding. Figures would be objectionable in the small cupolas, painted coffers being preferable.

One of the incidents that occurred during 1852 was an investigation of the ventilation and lighting of the Houses of Parliament. The effect of divided authority was not advantageous, and the conclusion arrived at was, therefore, that the entire responsibility should be confided to one competent person under the direction and supervision of the Office of Works. Although the arrangement has been in operation for half a century, it cannot be said that the members have no reason to complain of the condition of the building. Judging by the reports, it would appear that Dr. D. B. REID was accountable for no more than the House of Commons, which continues to be the most unsatisfactory part, while Sir CHARLES BARRY's method was employed in four-fifths of the Palace. Another incident was the commencement of the construction of the royal residence at Balmoral, which became the favourite abode of Queen VICTORIA.

A memorial was presented by the Institute of British Architects praying HER MAJESTY to direct inquiry to be made into the condition of the royal monuments in Westminster Abbey, and to order such steps to be taken as might be best calculated to preserve and worthily perpetuate the venerable and deeply interesting memorials of past sovereigns. Subsequently there was a restoration. The necessity of any appeal reveals the general indifference to the Abbey fifty years ago. The change in feeling must be ascribed in the first place to the efforts of Dean STANLEY, aided as he was by architects who explained the real importance of the Abbey as an architectural work.

As we said, there was anticipation in 1852, and at the close of the year, when the gain to art was considered, there must have been disappointment among ardent people.

A year is, however, too short a term for a test. War followed in the next year and progress was delayed. But in time there was a revival, and on the whole the advance of this country if gradual has been certain.

### THE UTRECHT PSALTER.

**A**MONG the most interesting illuminated manuscripts which have survived is one known as the Utrecht Psalter. It has given rise to much controversy among experts. From its character it is generally held to be an example of "opus anglicum," and consequently reproductions of it were made by order of the Trustees of the British Museum. It is sometimes considered that those drawings which are apparently of oldest date are no more than copies of Romanesque work, and on that account may have been produced in France or in other countries where illuminators flourished. In the last number of *L'Art* there is an article on the Psalter by Professor AUGUSTE MOLINIER, of the Ecole des Chartes, who has long been recognised as an authority on illumination and ancient manuscripts.

The manuscript was presented to the University of Utrecht in 1718 by a M. DE RIDDER. In the seventeenth century it belonged to Sir ROBERT COTTON, the zealous collector; Archbishop USHER mentions it, and in 1631 it was in the possession of Lord ARUNDEL. It was accompanied in COTTON's days by a charter relating to the Abbey of Reculver, in Kent, which was dated A.D. 679. As the abbey was in 949 assigned to Christ Church, Canterbury, Mr. DE GRAY BIRCH conjectures that the Psalter with its companion the charter may have been deposited in the cathedral library. M. MOLINIER believes there is something to be said in favour of the theory, and he does not hesitate to say that the Psalter is a fine example of Anglo-Saxon art. The Psalter contains in addition to the Psalms, the Te Deum, the Gloria, together with symbols of the Apostles and St. ATHANASIUS, whose creed is introduced in the manuscript. The text is set out in narrow columns, three on a page, with "rustic" capitals. The titles and first letters of each Psalm are in "onzial." In each Psalm is a pen drawing illustrating the lines of the text that follow. There are 166 drawings, and evidently in arranging the text space was left for them.

In fixing the date the first difficulty arises from the capitals. Letters of that kind were not subjected in the course of time to as many changes as the letters which form the text, and very ancient capitals continued to be employed with more modern forms of lettering. The Psalter was, on account of the capitals, supposed by some experts to date from the fourth century, and by others from the six or seventh. The disposal of the text in three columns should be of some value in ascertaining the date, but in this case there is a belief, as we have said, that the Psalter is only a copy of a more ancient example, and hence that evidence cannot be relied on. From the large ornamental letter "B" with which the volume opens, the manuscript has been taken to resemble two executed in Rheims and Metz in the ninth century. M. MOLINIER is of opinion that it is impossible to be precise about the time of the origin of the Psalter, and he concludes that it may be a reproduction by an Anglo-Saxon monk, executed between 750 and 850, of an earlier manuscript that was possibly Romanesque.

The figures in the drawings are sketches which show unusual facility in the use of the pen. Sometimes there is no outline, as in the wings of angels and the lower limbs, which are shown as covered by stockings. The hands are all remarkably large—that is an advantage in one case, where an organist is seen fingering the keys from behind the instrument—and from the way they are clad some of the figures appear to be hunchbacked. In the buildings introduced arches are common and the gates of cities are represented as elaborate structures. In several of the Anglo-Saxon manuscripts the buildings suggest there was more architectural art in England than is commonly imagined. M. MOLINIER asserts that two artists must have worked on the figures. One had a light hand and rapid stroke; the other was less dexterous and decisive, and in retouching some of his lines deprived them of character.

According to M. MOLINIER, the peculiar style of the draughtsmen indicates that they were endeavouring to copy older drawings. If they were designed by the artist there would be more signs of preparation. With all respect for M. MOLINIER, we must say that it is extremely difficult to realise the attainments of early Mediaeval illuminators. Let us take a parallel case. All who have studied Japanese work will be able to recall examples which seemed to be copies, and yet people who saw work in progress were able to vouch for it as being executed without the aid of any pattern or model or preparatory lines or points. There was probably a division of labour in monasteries, and certain accessories like those we see in the Psalter might have been put in first, and in that way guided the figure draughtsman in his arrangement and disposition of the groups.

The subjects of the illustrations are not strictly confined to attempts at realising King DAVID's thoughts. The wide range are made to suggest scenes which the artist adopted in the way that was best suited to his imagination. If, for instance, in the Vulgate there is mention of a forge, the design represents one, or when a just man is compared to a tree near water, we are shown a man asleep on the bank of a river, and the metaphors are transformed into real figures. The interest of the drawings consequently becomes historical as revelations of the life of the period when the illuminator was at work rather than as aids to the interpretation of the words of the Psalmist. M. MOLINIER points out that in the "Bibliothèque Nationale" there is a Psalter dating from the beginning of the thirteenth century, in which some of the drawings, which are exquisite examples of illumination, have been imitated from the Utrecht Psalter. It may be that both were based on the same original. He surmises there is also some relation between them and ivory carvings of the Carolingian period which represented Biblical scenes. From them pictorial Bibles probably were derived, of which the Utrecht Psalter may be a fragment. In Zurich there is an ivory which resembles an illustration in the Psalter, but which was the inspiring or older work cannot be determined. In any case, the supposition is warranted that several psalters were produced, and in order to expedite them more than one monk might be able to co-operate in the preparation of drawings.

It is not to be imagined that all the scenes are secular. Several are drawn from other parts of the Scriptures, and could therefore be the work of men who knew little of the world around them, while they could rely on other illuminations of the sacred text for models or suggestions. The costumes might be considered classical rather than English, but we know the influence of conventionalism in such matters was powerful, and continued till a very late date. M. MOLINIER says that the architecture is suggestive of Roman work, and the tables with supports in the form of limbs, the thrones and other objects recall those seen in Pompeian frescoes. The illustrations if rearranged could be made to serve as a treatise on archaeology; the only drawback is the impossibility of being able to determine the time in which they were produced. The Utrecht Psalter is, however, not the only illuminated manuscript which is tantalising because it is at once definite and indefinite. The solution which M. MOLINIER seems most acceptable is that one of the numerous Anglo-Saxon clerics who went to Rome, as was customary in the seventh or eighth century, on his return brought with him some old copy of the Psalter, with illustrations which belonged to the Imperial epoch, or about the fourth century, and that it was employed by the artist of a subsequent time. In copying it individual peculiarities might be introduced, as occurred when RUBENS made a replica of DA VINCI's cartoon, and in that way some of the characteristics of the original would be lost in the course of time.

In 1895 M. PAUL DURRIEN put forth the theory that the style of the Psalter recalls some well known work which were produced in Rheims and Metz, and in that region we should seek its origin. M. MOLINIER says it appears to him to be incomprehensible that any paleographer or archaeologist can profess to see a correspondence between the Psalter and the Metz Sacramentaire and the Rheims Gospels. The latter, which bears the name of Epernay, was among the Mediaeval treasures in the Paris Exhibition of 1900. M. DURRIEN relies on the form of

tain letters which he believes were only used Rheims or Metz. M. MOLINIER is opposed to that argument, for, as everyone knows, it was customary for monks to pass from one abbey to another. The artists therefore are not to be accepted as a clue to the origin of the Psalter. As regards the illustrations, it is admitted by M. MOLINIER there is some resemblance between the Book of Gospels and the Psalter. But on a closer examination the differences between them are still more remarkable. The artists of the Utrecht manuscript drew their figures with a few strokes. But in the work which belonged to Rheims every part is elaborated. The style is also unlike, and similar scenes are not treated in the same manner. That there was some common ground in the art of various periods cannot be denied, and the routine in which art was executed in monasteries far from would be sufficient to cause some similarity between the products. M. MOLINIER to the end upholds his opinion that the Psalter of Utrecht is an Anglo-Saxon work, and what he says should be accepted as authoritative. The article is one of the scholarly monographs relating to archaeology which are presented regularly in *L'Art*. It imparts a character to the pages by which the publication is elevated beyond those which, from their titles, would be presumed to have art as an object, and in which volatile opinions are made to do duty for learning, experience and common sense.

## THE CENTRAL LONDON RAILWAY AND VIBRATIONS IN HOUSES.

An article on the report of the committee appointed by the Board of Trade to inquire into the vibration produced by the working of the traffic on the Central London Railway, which appeared in *The Architect* of February 21, it was stated that vibration which is sufficient to cause serious annoyance in many houses, the members of the committee ascertained by personal observation. "There were, however, other causes employed. Mr. A. Mallock was entrusted by the committee with the duty of ascertaining the extent of the vibration demonstrated by special apparatus, and his memorandum on varieties of vibrations under different conditions has been published. The following part relates to vibrations in houses:—In connection with the present inquiry I have made observations not only on the vibrations in the ground caused by trains, but also on the like effects due to ordinary road traffic in streets paved with asphalt, wood and granite setts.

It was found that every footfall of a horse propagated a vibration in the ground sensible for more than a radius of 100 feet. New wood pavement and on asphalt the waves due to this were the only ones which could be distinguished. On granite setts, however, the effect caused by the jolting of the wheels over the successive stones far exceeded, and generally masked, the tread of the horses.

When observations are made of the vibrations of the ground caused by trains, it is found that although a great variety of periods are present in the motion, nevertheless when the vibrations are largest and best marked the chief component is a definite period which is nearly independent of the speed of the train, but differs for different classes of line construction. On the Central London Railway, with the rails on longitudinal sleepers and concrete, the frequency is about 15 per second.

These are the vibrations which have given rise to the complaints made by the occupants of houses in the neighbourhood of the railway, and the reason of their potency is that of the floors in good-sized rooms have natural frequencies of the same order of magnitude.

The origin of the definite frequency of the vibrations is found in the ground by the train is the natural period of the spring-borne load oscillating on the spring of the rails and its supports.

Whenever the vibration causing impulses due to the surface irregularities and variable yielding of the rail and its supports with this natural period, the vibrations excited are larger than they otherwise would be.

Experiments with the recording apparatus showed that the vibration of the walls and solid floors of the basements was very much compared with that of the floors of the upper rooms, so in fact, that by itself it would probably have escaped notice.

From the fact, however, that the room floors act as plates and have natural periods not much out of tune with the chief periods propagated from the train, and also from the "extinction" of the vibrations of the floors being sufficiently small to permit a considerable number of oscillations to be perceived as the result of a single impulse before the motion dies out, a kind of "resonance" effect occurs, so that a very small

motion of the supporting walls may, if properly timed, give rise to many times larger motions in the floor itself. Of course this applies also to any objects attached in any way to the walls, provided they too have the appropriate natural periods.

The observations showed that the most prominent period in the vibration records in the rooms of the houses experimented in was very nearly the natural period of floor of the room.

When an arbitrary harmonic force acts on a stable system so as to cause vibrations, two series of vibrations always co-exist during the early stages of the motion, one being the forced vibrations due to the applied harmonic force, and the other the free vibration necessary to satisfy the initial conditions as to the velocity and configuration of the system.

If the system is subject to little extinction the free vibrations continue for a proportionately long time, but in any case the free vibration is in general as important at first (unless the free period is small compared with the forced period) as the forced vibration.

When the train waves act on the springy floors of houses the forced and free vibrations of two distinct systems have to be considered, namely, the forced and free vibrations accompanying the train in the ground and the resultant which both the series have in causing forced and free vibrations in the floors.

It can be shown that in the circumstances the most prominent period in the resultant would be the period of the system having the smallest coefficient of extinction, and that if the two systems have not very different periods and the same coefficient of extinction, the principal period would appear as the mean of the respective periods of each system.

Since, therefore, the periods observed in the houses are the same or nearly the same as the periods of the floors, and the period excited in the ground by the train is largely that due to the load oscillating on the spring of the rail and its supports, it follows that the vibrations in the ground and in the houses must be looked on as fragmentary series of free vibrations on which are superposed forced vibrations, generally much smaller, following in period and phase the irregularities of the rails.

A somewhat analogous case is that of a ship rolling in a seaway.

Whatever may be the periods of the waves, if the ship rolls, the period of rolling is found to be very nearly the free period of the ship rolling in still water, and it is only in the case of an unusually long train of equal waves that the period, amplitude and phase of the roll approaches agreement with the ordinary theory of forced vibrations with the initial free vibration suppressed.

Perhaps the most remarkable thing which the inquiry on the subject of train vibrations has made evident is the extreme smallness of the actual motions which give rise to complaint.

The amplitudes of the vibrations in the houses examined rarely exceed a thousandth of an inch, and such an amplitude when the frequency is over 10 per second is a genuine source of annoyance.

It is true that a single person walking across the floor will set up much larger vibrations, but as far as the occupants of the room are concerned this does not seem to be noticed. The cause of the disturbance is evident, and the motion of the floor ceases when the people cease moving. The vibrations caused by the trains, on the other hand, are most conspicuous when the house is otherwise quiet.

In the accounts given by complainants occupying houses near the Central London Railway it was often said that the intensity of the vibrations varied much at different times of the day, although the times mentioned were not always the same.

In order to investigate this and also to find out whether any particular locomotives or trains were responsible for the more intense vibrations, concerted observations were made on April 17, 1901, by means of observers placed in houses from which complaints had been received, who noted by estimation the intensity and duration of the vibration caused by each train throughout the day and the time at which it occurred, while at the adjacent stations at Marble Arch and Lancaster Gate other observers timed the arrival and departure of the trains and recorded the distinguishing number of the locomotives.

An analysis of these observations showed:—(a) That it was a matter of chance whether a given locomotive caused a slight or a severe vibration; (b) that trains causing severe vibrations in one house were as likely as not to cause only slight vibrations in the others; (c) that different rooms in the same house were not similarly affected by the same train.

Considering the irregularities of the rails and non-circularity of the wheels these results are not surprising. There must evidently be a large element of chance in the way in which the non-circular wheel engages with the irregularities of the line, and it will be a matter of chance also whether one, two or more pairs of wheels are in the best position to cause vibrations at the same time. The irregularities in the wheel are not by any means uniform all across the tread, and it is probable that this is also true of the irregularities of the rail, so that a wheel whose flange was as close as possible to the rail would most

likely experience vertical accelerations different from what it would were the flange as far from the rail as the slackness of the gauge permitted. Small differences of speed also may have a great effect where the rail irregularities have a constant pitch.

In the house (No. 13 Hyde Park Terrace) where vibration tests were also made with all three classes of rolling-stock, the proportion was still more in favour of the geared locomotive and multiple unit motor, the ratio of the vibrations caused by each being 10, 4, 1.

This is probably accidental, and due to the chief natural periods of the lighter non-spring-borne loads of the geared locomotive and multiple unit motor being quicker and further removed from the natural period of the floor of the room.

Comparing the train records at 13 Hyde Park Terrace with the records (taken at the same place in the same room) of the street traffic outside in Bayswater Road, it will be seen that in point of magnitude the street traffic vibrations come between those of the geared locomotive and the multiple unit motor. It appears, then, that objectionable vibrations can certainly be avoided by reducing the non-spring-borne load on each axle to something under 2 tons in the case of a train running at speeds up to 30 miles an hour and on rails laid in any of the

usual ways, and no doubt at present this is much the simplest procedure.

There can be little question, however, that if the surface of the rail could be made nearly smooth or with only very gentle and gentle irregularities, much heavier non-spring-borne loads might be used without inconvenience, and I think this possibility should not be lost sight of, since if train speed of 100 miles an hour or more ever become common, it is almost certain that more care will have to be taken in making the surface of the track uniform than is at present found necessary.

In every house where observations were made it was found that the vibration of solid stone or floors in the basements and of the actual walls (both of which may be considered as moving a part of the ground on which they rest) was very small, not exceeding in general 1 or 2 ten-thousandths of an inch.

Such a vibration if it had the frequency of 15 per second would alter the effective force of gravity plus and minus to 4 per cent. alternately, and would by itself not be noticeable.

The effect of such a vibration, however, if it acts on a system having anything like the same period, will be to set up in that system vibrations many times larger than itself.

The floors of rooms are ordinarily made quite stiff enough

to bend much under the loads they carry, and as long as are sufficiently strong and the bending is not noticeable to the eye, the conditions both as to safety and appearance are satisfied.

Small bendings amounting to a tenth of an inch or less at the centre of a good sized room would not be recognised, and most floors sag to something like this extent when loaded in the usual way may be found both by calculating the deflection from the dimensions of the joists and by actual observation.

But the amount of the elastic yielding under the load is approximately the length of the pendulum which has the period of vibration when made to vibrate up and down. As so much of the load which a floor bears consists of its own weight, the period of the equivalent pendulum will always be less than the period of displacement due to the load, but if it be taken that the effective displacement lies between a twelfth and a twenty-fourth of an inch, the natural period of the floors will lie between one-eleventh and one-fifteenth of a second, and actual measurement of the periods of many floors shows that this is the case.

Hence it might naturally be expected that floors would be ready to respond to outside vibrations such as those caused by the Central London Railway trains, the principal period of which is itself a fifteenth of a second.

Now great the magnification of the original vibration by resonance of the floor may become depends partly on the closeness of the agreement between the periods, and partly on the rate at which the vibrations of the floor would die away if left to themselves.

The closer the agreement between the two periods and the nearer the rate at which the free vibrations of the floor die away the greater is the magnification.

The rate of extinction of the floor vibrations depends to a great extent on good workmanship; hence it is probable that a well-made floor where the joists are bedded on good foundations and the floor boards sound and properly attached to the joists, would be more likely to have large vibrations set up by resonance than one where these conditions are not satisfied.

At the same time, in order that the maximum vibrations be set up there must be a closer coincidence between the periods, and it may therefore be expected that the maximum vibrations will occur more rarely with the less extensible well-made floor than with others, but will be greater when it does occur.

These points are touched upon to indicate the likelihood of different vibration effects being met with in houses differently situated as regards their distance from the railway.

It has been mentioned before that in such vibrations as are set up on either side of the railway the motions of the ground are almost entirely vertical. This was proved by mounting the pendulum weight of the vibration apparatus so that it could move horizontally, and finding that the horizontal motion of the ground was small compared to the vertical motion. The period of the waves in the ground is so large that the wave length of 15 per second waves cannot be less than 300 feet\* on the surface, and will probably exceed 500 feet at a depth at which the surface conditions cease to operate. Hence the horizontal motions which must be caused in the upper rooms of a house by the tilting of the foundations by the wave slope will be small compared to the vertical motions depending on the wave amplitude. The maximum wave slope of

whose length is  $\lambda$  and amplitude  $a$  is equal to  $2\pi \frac{a}{\lambda}$ .

The horizontal displacement in a building at  $h$  feet above the surface of the ground is  $2\pi \frac{h a}{\lambda}$ .

For example, if  $\lambda$  is taken as 500 feet, the horizontal and vertical amplitudes would be equal at a height of 80 feet.

The horizontal motion, however, having regard to the actual amplitudes found for  $a$ , would not make itself felt, and it would be no tendency to cause the floors to vibrate, though it might excite objects in more or less tottering equilibrium to rattle.

It may be noticed here that it is as uncommon to find any large piece of furniture with a natural period as low as 15 seconds as it is to find a floor whose period is much quicker, and it is as regards torsional vibrations (which would be excited by vertical but not by horizontal motions of the floor).

One other point may be mentioned, viz that the vibrations set up in floors by people walking on them far exceed in magnitude the largest vibrations caused by the trains.

Though the impulse given to the floors was in each case by a single tap with the foot, the initial magnitude of the vibrations thus started is not less than twice as great as the vibrations of the train vibrations recorded in the same places.

The lower number is derived from some interference phenomena, which I have observed in surface ground vibrations, and the higher number from earthquake observations and the known values of the volume and density of clays.

## ATHELNEY CHURCH.

THE Rev. A. H. A. Smith, vicar of Lyng, near Taunton, writes:—"I shall feel most grateful if you will kindly give me space to ask for help towards the restoration of the church, the centre of the parish in which is situated the historic 'Isle of Athelney,' which has been most aptly and justly called the 'cradle of England's greatness.' And the name of Athelney is associated, not only with the glorious memories connected with King Alfred, the heritage alike of the mother country, the Empire and of the great Transatlantic Republic but perhaps even more with the recollections of childhood, the burning cakes, the scolding wife, the grave and patient monarch, his entry into the Danish camp disguised as a minstrel, and his final triumph over his enemies. From this our island King Alfred went forth to victory; and here, in gratitude for his deliverance from the Danes, and in remembrance of the privations he endured and the blessings he enjoyed in this little spot, he erected and endowed a monastery, which, like other similar foundations, was swept away by the plundering legislation of Henry VIII. The last stone of the ruins has long vanished, the one venerable building connecting the present with the past being the little church of Lyng, a 'capella' of the abbey, which stands midway between Bridgwater and Taunton, a landmark to all travellers on the Great Western Railway, and, even in its present state, a building of no little beauty, consisting of chancel, nave, with north and south porches, and a western tower. Masonry, flooring and roofing all need very careful repair, but the greatest care will be taken to preserve, as far as possible, all existing features, and only to repair or rearrange old work in stone or wood where it is absolutely necessary to do so. It is hoped that, in addition to the necessary repairs, the restoration may include the filling-in of the beautiful west window with stained glass illustrative of the principal events in the life of King Alfred the Great. As regards the cost, it has been estimated that at least 1,500*l.* will be required to put the fabric into complete repair, and though there is no possibility of raising this sum in the immediate neighbourhood, I trust and believe that many, even of those who have never seen the 'Isle of Athelney,' will feel that an appeal for the preservation of King Alfred's church is deserving of cordial and general support. . . . A small monument on Athelney Hill marks the site of the abbey, and through the praiseworthy and successful energy of Mr. Wyndham Slade, a descendant of the founder, sufficient funds have been raised for its fitting repair; but the little church in its decaying beauty still claims reverential sympathy and generous help. . . . I purposely deferred putting forth my appeal to the public until the conclusion of the millenary celebrations, being anxious to avoid even the possibility of being misunderstood as putting forward, though but in a small degree, a rival, instead of, as it is, a supplementary scheme."

## FITZWILLIAM MUSEUM.

THE Fitzwilliam Museum Syndicate, in their fifty-seventh annual report, state that during the year 1901 the number of visitors was 41,378, and to the Museum of Classical Archaeology 4,520. Among the gifts to the museum the following are specially mentioned:—By the Master of Trinity Hall, the Rev. H. Latham—a collection of 130 bronze medals struck during the reign of Napoleon I, together with other French bronze medals and a collection of twelve Indian gold coins; by the Registry—a portrait in water-colour of Dr. Barnes, Master of Peterhouse, 1788-1838, and also L. Delisle's "Cabinet des Manuscrits de la Bibliothèque Nationale;" by the Rev. W. G. Searle, of Queens' College—a number of coins; by the committee of the Egyptian Research account—a collection of Egyptian antiquities, many fragments of sculpture, notably a finely sculptured sarcophagus lid; by the director of the museum—a collection of Greek antiquities and a set of water-colour drawings of the colleges in Cambridge made in 1825. Mr. Pendlebury, of St. John's, was a donor of twenty-one volumes of music, and Dr. Mann, University organist, gave five volumes. A catalogue of the pictures has been completed by the assistant-director, and will be published during the present term.

Traces of a remarkable Norman fresco have been brought to light during the restoration of the old church at Claverley, Shropshire. At the Reformation, or before, it had apparently been plastered over, and is practically ruined. This is the more provoking since the fresco is of great interest. It is identical in treatment and general idea with the famous Bayeux tapestry. A frieze on which are shown knights in the scale armour of the time apparently represents a fight, the combatants being "laid out" horizontally. Some of the figures, or fragments of figures, stand out with surprising clearness.

## NOTES AND COMMENTS.

WHEN towards the close of the fifteenth century Bishop STOREY paid 10*l.* of lawful money for the ground on which the noble market cross was erected by him in Chichester, the mayor and burgesses guaranteed that they would make no claim nor trouble any poor people who were hereafter to stand or sell within the cross. They were not to allow houses to be built against it or so near as to interfere with access to it, and no toll or other duty was to be levied for standing or selling within it. There was not any agreement about the conservation of the beautiful structure, but from time to time the Corporation voted money to preserve it from collapse. Since 1820 no money has been expended on the cross. Fifty years ago attention was called to the condition of the relic, but without avail. Chichester, like other places in Sussex, is very slow in its resolutions, and from year to year, while the restoration was supposed to be under consideration, the masonry has been decaying. At the present time every policeman who takes up his station under one of the arches risks his life, for at any moment the whole of the upper part of the cross may collapse. It has been estimated that about 280*l.* will be required for the reparation of the masonry and 100*l.* more to provide new clocks. The mayor has offered to subscribe 80*l.* if the remainder of the money is forthcoming. For a city the sum may appear only trifling, but the people of Chichester are at the present time indebted for some thousands of pounds for the payment of law costs in connection with the sewage disposal. They are consequently not in a generous mood. They should, however, remember that one of the objects which attract visitors to Chichester is the market cross, and if by neglect Bishop STOREY's gift should be destroyed, it is no exaggeration to say that less money would be expended in Chichester.

THE architect or engineer who is engaged on public works in India has to submit to regulations which are fortunately unknown to private practitioners in England. One of the most embarrassing forbids him to obtain goods of British manufacturers either directly or through their agents in India, except under extraordinary circumstances. All articles required have to be ordered through the Secretary of State. The original reason for this rule was to find employment for officials attached to the India Office, who were to examine the goods to be sent out before shipment. The waste of time caused by such a roundabout method is incredible. Rarely are public buildings decided on before it is almost impossible to do without them, and hence the architect has to use the utmost expedition in realising his plans. But when everything has to come through Government offices not only weeks but months are at once lost. The alternative of obtaining a special permission to purchase the goods from Indian agents also means considerable delays. For the classes of goods demanded by architects it is only necessary to glance over the advertisement pages of a journal like our own to discover the firms who have an established reputation and who could supply Calcutta, Bombay or Madras, with as much attention to the quality desired as is given to orders from any part of Great Britain. Under existing conditions it is sometimes risky to appoint agents in India, and there is no difficulty in proving that orders sent through the post or by telegram are not only expeditiously but satisfactorily executed. In that way also the mischances of orders finding their way inexplicably to foreign firms would be avoided.

It might be expected that the creation of a Federal city would be looked upon as an opportunity to attract English architects of ability to Australia. But in New South Wales, at least, there appears to be a sufficiency. "The Year Book" lately issued has the following warning:—"There appears to be a strange fascination in the study of architecture, for the number of architects in New South Wales is out of all proportion to the demand for their services, despite the steadily increasing activity in the building trades. Most of the Australian architects have travelled a great deal, and have comparatively little to learn. They all have pupils of more or less promise, and many others are receiving instruction in the Sydney Technical College or in private classes. Not a few of the public and private buildings in the State will bear com-

parison in artistic treatment and boldness of style with the same class in older countries. Hence professional architects intending to settle in the colony would find the ground almost wholly covered. Even in interior decoration there is no lack of designers or artists, but the expenditure in this direction in Australian buildings is comparatively limited. Stained glass is mostly imported, but some is manufactured locally, although not to an extent sufficient to encourage the immigration of design-skilled workers." If the principle of federation succeeds it is possible there may be more hopeful prospects.

THE difficulty of persuading local authorities to take steps for the preservation of relics of antiquity has been again exemplified in Rye. Many visitors have desired that they could live in a town equally picturesque and possessing that glamour which ancient architecture always confers. In Rye several gentlemen have formed themselves into a committee for the safeguarding of what remains of the town, and they have not only given time and attention to the work, but have paid all the expenses, in order that no objection might arise from such an application of ratepayer's money. In a letter from the secretary which was read at last week's meeting of the Rye Town Council it was pointed out that archaeologists and others objected to the removal of the door, &c., on the ground floor (used as a mortuary) of the Ypres Castle, and the Council were requested to consider the advisability of transferring the mortuary from its present position to, say, the square modern tower at the south-east corner of Ypres Castle, known as the women's prison. If the Council consented to those alterations being made, the committee would be prepared to contribute towards the cost of such removal if the same were carried out to the satisfaction of their hon. architect, Mr. HESSELL TILLOTSON. But much opposition was aroused by the proposal, mainly on account of the remote contingency that a little more would have to be expended by the Town Council, and it was difficult to say whether the desirable alteration would be permitted.

THE investigation by Mr. A. MALLOCK of the vibrations caused by the working of the traffic on the Central London Railway will cause much surprise. Apparently the investigation after all that has been said, only "sound and fury signifying nothing." The effect on the flooring of a house is no less than is produced by stamping with the feet. This will seem incredible to those who are able to bear witness to the annoyance of the vibration. But the manner of testing leaves no doubt about the accuracy of Mr. MALLOCK's conclusions. The instrument employed was a mechanically recording seismometer, which at first enlarged the actual motion of the ground to ten times the full size. Afterwards an instrument was used which recorded photographically and gave a magnification of seventy-five. Like all instruments for determining the absolute magnitude of vibrations, where a fixed zero is not available to measure from, it depends on a weight suspended by a spring from a support, which itself moves with the vibrating body. The period of the suspended weight on its spring being very long compared with that of the vibration to be measured. The result is that, when the support vibrates, the suspended weight is left practically at rest, or any motion it acquires is almost entirely a vibration in its own long period, which can readily be distinguished from the quick movements of the support. The relative movement, therefore, of the weight and support, freed from the oscillation of the weight, gives the absolute displacement of the support. For this reason care taken in the observations the results are not likely to be questioned, and it may therefore be taken for granted that, although inconvenience arises, the vibration on underground railways in London does not cause injury to buildings, although it may diminish the value of residences.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. William Emerson, president, in the chair.

## Royal Gold Medal.

The PRESIDENT at the opening of the meeting said it would be remembered that the Council had nominated Mr. Bentley for the gold medal of the year. Unfortunately Mr. Bentley died two days before the election of the gold medallist. The Council applied to the King to learn His Majesty's decision in such a circumstance. They were informed that the King was not in favour of the creation of a precedent for the bestowal of a medal on a gentleman of whose selection there was no formal approval. The Council, ruled by the King's decision, had therefore to nominate another candidate for the gold medal, and accordingly nominated Mr. T. E. Colcutt.

The following were elected as Fellows of the Institute:—Mr. R. Langton Cole, of London, and Mr. James Miller, of Glasgow.

As Associates:—Mr. A. E. Biggs, of Felixstowe; Mr. W. Vatkin Ellison, of Erith; and Mr. T. Marshall Smith, of London.

Mr. W. AUMONIER read a paper on

## Inlay and Marquetry.

He said there were two methods of making inlaid wood. The one is to cut the design which is intended to be inlaid and the ground or field out of various sorts of veneers, all of the same thickness, fitting and fixing them together by thin paper on one face and laying this, the open face, downwards as a whole upon a solid ground or board. This is veneered work. The other way is to cut the design out in separate pieces as above, but out of wood 3-16 inch to ¼ inch thick, using the same process of marking out, and then putting the complete print of the design on to a solid ground or board, sinking holes by carvers' tools the required depth and driving the pieces in, thus making a "solid inlay." In speaking of "marquetry" and "inlay," it was never quite understood which sort of work as indicated—whether the solid inlay or the wholly veneered work. As the workmanship of each was so distinct, he would use the term "marquetry" for veneered work and "inlay" for the solid inlay above described. The author then dealt with the technical side of the question, describing the old-fashioned process and that now generally employed, of marking and fitting the design in the wood, shading, &c. In his opinion, strong contrasts or too many different colours on the same panel should be avoided, except, perhaps, in the case of ivory, ebony, or mother-of-pearl in rosewood. One should depend rather upon soft harmonies, such as are seen in the best examples of Louis XVI. work, with their warm soft greys and yellows, or in the golden glow of the magnificent inlay in Pisa Cathedral. A broad effect should be striven for, to be produced by the quality and colour of the wood itself and by the direction of grain in which each piece is placed. On no account should scratching or engraving be used on the surface of the inlay, as of all to express roundness, or relief in form. Dealing with a flat surface, an absolutely flat treatment should be allowed. One should not aim at too great fineness or intricacies and complications of lines in the design. It is useless to emulate the painter and attempt to make too much of a picture—the material is against it.

The author went on to speak of the difference between the quality of marquetry and inlay, taking the words to bear the meaning above attached to them. "Marquetry," being wholly the work of the saw, is apt to become a little too soft and undulating, and perhaps a little bit flabby in parts, under the influence of that more or less mechanical instrument; while "inlay," being partly the saw's work and in part the work of carvers' tools—cutting in and working by hand—is capable of receiving a stronger, more vigorous treatment of outline, and is therefore likely to reach an individual and lifelike character of form unattained by the saw alone, which stamps it as finer work—from an art point of view; and even the occasional inaccuracies of fitting and consequent different thicknesses of joints here and there, give it a distinct charm of its own. It also has a more pleasing quality of surface, especially as in course of time the inlay, being thinner, shrinks more than the solid ground, and thus becomes a little lower than the general surface, making a delightful play on the face of the work.

Solid inlay, with the inlay left in relief and afterwards carved, the author strongly condemned. Carving—as carving is not improved by having its ground made of a different colour from itself. Inlay—as inlay—is not helped by having its surface frittered away by the undulations of carving. In conclusion, he urged them to sweep away all scratchy, uncharacteristic work and get back to the face of nature for inspiration in this as in other arts.

## Wax Inlay.

Mr. HEYWOOD SUMNER in a second paper dealt with the simplest form of inlay in wood, namely, coloured wax stoppings,

a form of inlay which has fallen into neglect. The Victoria and Albert Museum has some very fine specimens of old work of this kind. The effect is produced by incised lines, sunk spaces and dots, all filled in flush with green and red wax. Though after the lapse of 550 years some of the stopping has perished, yet the beauty of design yielded by the firm incisions remains, and these old examples show what fine things can be done in this method by artists who understand the graphic possibilities and the limitations of flat surface decoration. Mr. Sumner went on to describe the method he had employed in some experiments of his own in this kind of work. First trace the design on the panel of wood to be incised, cut it either with a V tool or knife-blade fixed in a tool-handle, clear out the larger spaces with a small gouge leaving tool-mark roughness in the bottom for key; when cut stop the suction of the wood by several coats of white hard polish. For coloured stoppings resin (as white as can be got), beeswax and powder distemper are the three things needful. The melted wax may be run into the incisions by means of a small funnel with handle and gas-jet affixed; it is attachable to the nearest gas burner by india-rubber tubing, so that a regulated heat can be applied to the funnel. When thus attached and heated pieces of wax of the required inlay colour are dropped into the funnel, and soon there will be a run of melted wax dropping from the end of the funnel-spout, which is easily guided by means of the wooden handle, and thus the entire panel may be inlaid with the melted wax. Superfluous surface wax is cleared off with a broad chisel so as to make the whole surface flush. The suction of the wood is stopped by means of white hard polish, otherwise the hot wax will enter the grain of the wood and stain it. Incised panels may be filled successfully with japanners' gold size and powdered distemper colour, using a palette knife to distribute the slab mixture. The melted wax, however, gives a more interesting and accidental result, and is better suited for designs that depend on spaces of colour-stopping for their effect. A close grain is the one thing needful in the wood. As to design, that which is best suited may be compared to a broad sort of engraving. Within certain limits the manner of design is more free than is the case with inlay composed of veneers of hard material. The absence of beauty of material—e.g. pearl, ivory, or choice woods—must be forgotten in the beauty, fancy and austere freedom with which the incised decoration is expressed.

Mr. J. D. CRACE said although he differed on a particular point with Mr. Aumonier, he was glad to move a vote of thanks to the authors of the two interesting papers.

Mr. T. BUTLER WILSON seconded the motion.

## THE ABBEY AND THE OFFICE OF WORKS.

THE following letter has appeared in the *Times*:—

In preparation for the coming Coronation the Office of Works is once more about to be turned loose, as it was in 1887, into the Abbey Church of Westminster. The moment, therefore, seems opportune for invoking your aid against a repetition of the kind of wanton havoc which was played in the church fifteen years ago. Three of the grosser outrages then perpetrated deserve to be specified:—

1. On the north side of the sacrum are three magnificent tombs with lofty canopies. They are some of the best specimens of their class in existence, and are believed to have been the work of one artist. Their date is late thirteenth or early fourteenth century. One of them is the tomb of Aveline Countess of Lancaster (ob. 1273), of whose recumbent effigy a fine engraving was published by Stothard. This figure, specially noticeable for its admirable drapery, was shamefully ill-used in 1887, when large fragments were broken off it. Some of these were lying by the side of the effigy when the Abbey was reopened to the public.

2. Abbot Richard de Ware, who was elected in 1258, shortly afterwards visited Rome, where he stayed two years. From thence he brought a quantity of materials, including porphyry, palombine and serpentine for the paving of the sacrum in mosaic. This exceedingly fine example of "Opus Alexandrinum" was constructed by an Italian workman, Odericus, who accompanied the abbot to England. Obviously nothing could have been easier than to cover Abbot Ware's interesting pavement with a few planks while the works connected with the 1887 Jubilee were in progress. This simple precaution being neglected, the mosaic was badly smashed in various places, apparently by tools and scaffolding being flung down upon it from a height. The largest and worst of these injuries can easily be traced on the south side, a few feet in front of the portrait of King Richard II.

3. The worst and most wanton piece of vandalism was the treatment accorded to the Coronation Chair. Before 1887 its general colour was that ashy grey so characteristic of very ancient wood, while on various parts of its surface were still to be found traces of its original ornamentation in gilded gesso. In

preparation for the Jubilee the chair was smartened up by an ordinary workman with a coat of dark brown polish—a process which obliterated the remains of the antique decoration, and imparted to the venerable relic a spick-and-span look, reminiscent rather of Wardour Street than of Westminster.

Of minor injuries to the fabric of the church there were many, including a number of chips and scratches (as of hob-nailed boots) plainly visible on the triforium arcading and on the diaper work of Henry III's walls.

A long and bitter experience of the ways of the Office of Works shows that it is not fit to be trusted with the charge of historic monuments. Is it asking too much to demand that nothing shall be done during the next three months to the fabric or furniture of Westminster Abbey without the consent of the accomplished surveyor to the Dean and Chapter, Mr. Micklethwaite?

### CHESTER CATHEDRAL.

A PARTY of members of the Chester Archaeological Society went on Easter Monday to Chester Cathedral for the purpose of inspecting the important works of restoration which for a considerable time past have been going on in the south transept of the cathedral, and are now nearing completion.

Archdeacon Barber was a very efficient cicerone. Seats were provided in the transept for the accommodation of the visitors, and before the inspection was proceeded with the Archdeacon read an interesting paper descriptive of the transepts' main features, both artistic and historical. Particularly interesting was his explanation of the artistic designs in the present restoration.

Dealing at the outset with the historical part of his subject the Archdeacon said the story of the great south transept—this unique feature of Chester Cathedral—had often been told, therefore he would content himself with a brief epitome of it. Originally the south transept was of the same size and character as that of the north transept. When the monks of the fourteenth century were anxious to extend the proportions of their church, and to erect chapels dedicated to particular saints, they found it impossible to do this towards the north, as the monastic buildings abutted closely on the church on that side. They must therefore enlarge towards the south. Here their progress was barred by the parish church of St. Oswald (if indeed it bore that title at the time), but a way out of this difficulty was simple, viz. the erection of another church in close proximity for the use of the parishioners. Whether this was done before or after the building of the transept it was perhaps not possible to say with any certainty, and opinions seemed to differ on the point. But one thing was certain—that in the original conception and building of the transept the only entrance to it was through the rest of the church. There was no external doorway in it, and this almost led to the conclusion that a church was first built for the use of the parishioners, and then the building of the transept was proceeded with. That church was dedicated to St. Nicholas, and was now the music hall. The late Mr. J. H. Parker and Sir Gilbert Scott ascribed the date of the transept to Abbot Richard Synesbury about the middle of the fourteenth century, and this theory was supported by the character of the arches. But the first builders only worked to the triforium level, leaving the upper portion to their successors, and probably temporarily roofing in what they had done. This at any rate was the opinion of Sir Gilbert Scott. The clerestory, the large south window (as first erected) and the west windows belonged to the fifteenth century, and were probably the work of Abbot Simon Ripley. In the plate of the series of window-tracery from Chester Cathedral, prepared by Mr. Ashpitel, and published in Mr. Parker's tractate, the date ascribed to the windows of the eastern aisle and the southern extremities of both aisles was 1360, and to the clerestory windows 1490. These considerations to which others might be added by the architectural expert gave us a fairly accurate idea of the date of the building of the transept, and of the time which elapsed before it was completed. Sir Gilbert Scott, referring to this part of the cathedral, said:—"Of the Later Decorated style we have a truly magnificent example in the south transept, whilst of the Early Perpendicular we have specimens in the clerestories of the same transept." In saying this Sir Gilbert Scott was not unmindful of the extreme difficulty which must attend any attempt at disentangling the works of different dates, for he remarked that the Perpendicular work of the nave and transept was so intermingled and complicated as almost to defy such attempt. We could not be too thankful (said the Archdeacon) that the project of recasing and repairing the exterior at the beginning of the nineteenth century did not proceed further than the main south front, where the result was so deplorable, that it had been characterised thus, "As mean a work as that century has produced." He had already referred to the reason of the extension of the church in this direction,

viz. the erection of more chapels with special dedications. The dedication of two of these chapels was known. The southern one was the chapel of St. Nicholas, and the northern one was that of St. Mary Magdalene. There was no record of the dedication of the others. One was described in the plan as "the chancel." Could this have been dedicated to St. Oswald? The other was nameless. We were told that "John Arneway, who had been ten times successively mayor of Chester, and died 1278, is said to be buried before St. Leonard's altar in the south part of the conventual monastic church, where he founded two chantry chapels. But this would be nearly 100 years before the date which has been suggested for the building of the transept. Could it be that the transept not only occupied the site of the parish church of St. Oswald, but also that of the altar of St. Leonard and the two chantry chapels, and that these were continued in an altered position in the enlarged church? Unless evidence was forthcoming from some unknown and unsuspected quarter this must be a mere matter of conjecture. In 1488 the parishioner deserted St. Nicholas Church (which after being desecrated became in 1545 the common hall with a warehouse underneath later a theatre, and now the music hall), and once more claimed and successfully asserted their rights to their old location. The transept became their parish church and so continued until 1880, when the new church of St. Thomas was substituted for it, and St. Oswald's became an integral part of the cathedral. During those 400 years the building must have witnessed many vicissitudes. At first there was perhaps no division, or at any rate only a low screen separating the church on the northern side from the rest of the building, and the services for the parishioners had to be conducted at times which did not interfere first with the devotion of the monks and afterwards with the cathedral services. In 1827 Dean Copleston erected a solid partition reaching to the roof by way of making both buildings distinct, so that the services might be held simultaneously in each. They all knew how unworthy of the rest of the cathedral this portion seemed when it was once more thrown into it. There was the uneven wooden floor on which the pews had been placed; the white wash on the walls and columns, in both of which were large holes where the supports of galleries and pews had rested. When visitors entered the cathedral by the St. Oswald's door they were aghast at the dilapidated and apparently uncared-for condition of the building as they found it. The Archdeacon then described in order the various stages of the restoration or reparation of this transept after 1,000*l.* granted by the Ecclesiastical Commissioners had been expended in 1880 in the necessary repairs of external work. The first thing undertaken was the groining of the eastern aisle. Having explained the representations on the various carved bosses and mentioned that two of the windows were filled with stained glass about this time as memorials to Colonel Twemlow and General Harding, the Archdeacon passed on to the year 1887, when the mean tracery was removed from the great south window and replaced by the elegant and graceful flamboyant tracery which was now to be seen under Sir Arthur Blomfield. The subject of the window was "The Triumph of Faith," and the whole cost of both stonework and glass was borne by Earl Egerton of Tatton, to whose father the first Baron Egerton of Tatton it formed a memorial. In 1889 the eastern aisle was refloored, the divisions between its several chapels indicated and the sedilia and piscina in St. Nicholas's Chapel restored. This last was a memorial to Mr. Timothy Lee. Other windows designed by Mr. Kempe were added as memorials to the husband and father of Mrs. Arthur Potts, and the Hon. H. C. Raikes, M.P. Coming to the restoration now approaching completion, Archdeacon Barber, after explaining its inception as a memorial to the late Duke of Westminster, said everyone would be struck with the transformation which had been effected, and with the completeness and thoroughness of the work which had been done. The columns and walls had been cleared of numerous coats of whitewash, thus disclosing the original stone. Extensive repairs were necessary not only at the bases, but also in other portions of the piers, and this had been carefully and skilfully done so that the newer masonry harmonised absolutely with the old. The vaulting of the roof had been carried out for the first time, and we had now the oak groining in the centre aisle and stone groining in the western one. All the bosses were designed by Mr. Blomfield in conjunction with Messrs. Thompson, whose carvers executed them under the skilful guidance of Mr. Fincher, who carved the bulk of the figures himself. Anyone who was privileged to be present when this was being done could not help being struck with the artistic care and intelligence displayed. Some impression might be formed of the vastness of the work from the fact that the stones out of which the larger bosses were carved weighed three-quarters of a ton. Turning first to the central portion they could not but admire the general effect of the oak groining, and again commend the wisdom of Sir Gilbert Scott and his successors in adopting this mode of treatment. The colour of the stone was such that the two

materials blended together in perfect harmony. There were twenty-nine carved bosses in this portion of the roof. Five of the larger ones represented "Abel kneeling at an altar, on which is a lamb," "Noah's ark with the dove returning with an olive leaf," "Abraham offering up Isaac," "Moses descending from Mount Sinai," and "Joshua crossing the river Jordan." The other larger bosses were coloured and heraldic, representing the arms of the Duke of Westminster, the Archbishop of York, the Bishop of Chester and the Dean of Chester. In the northern bay of the western aisle the large boss represented "The Baptism of Our Lord by St. John," and the smaller ones had reference to the event, for instance, the hovering eagle, the fish with a label inscribed "Ex aqua et Spiritu Sancto," the dragon pierced with a sword, significant, it seemed to me, of the exorcism which used to accompany baptism. In the next bay we had "The Transfiguration" with Our Lord in the act of blessing, holding the orb and cross. The Old Testament saints were called to mind by the bosses on either side. In the next bay we saw "The Resurrection of Our Lord," and in the east and southern bay "The Ascension," with the eleven apostles. In conclusion Archdeacon Barber expressed the hope that these visits of the Society would quicken intelligent interest in the beautiful cathedral, and would also tend to the being and greater prosperity and usefulness of the Society. Mr. H. Taylor having directed attention to an interesting tablet in memory of Ald. John Leche, whose family were a younger branch of the house of Carden, who settled here in the early part of the sixteenth century, Dr. Stollerfoth proposed a hearty vote of thanks to Archdeacon Barber, which was passed unanimously. The company then inspected many features of interest in the restored transept, also several drawings kindly lent by Archdeacon Barber.

## SHALLOW TUNNELS FOR RAILWAYS.

HERE was a time when foreign experience would not have much influence on any question connected with railways in this country. All the world used to derive instruction from England. But all that has been changed, and we are all now disposed to over-estimate the importance of foreign experiments. The Board of Trade having sent the inspecting officer of railways, Lieut.-Col. A. H. Yorke, to examine the Chemin de Fer Metropolitain de Paris, his report has appeared. The following are the most important remarks:—

The complete scheme of underground communication at present authorised in Paris comprises a system of railways in shallow tunnels, having a total length of 38·86 miles. Of the total length seven-tenths is designed to be in tunnel, and the remainder in open cutting or on viaduct. Nearly all the lines are double, the tracks being laid side by side in the same tunnel.

The only portions of the system that are at present completed and open for traffic are the east-west line from the Porte de Vincennes to the Porte Maillot, and short lengths from the Porte de l'Etoile to the Porte Dauphine, and from the Place de la Bastille to the Trocadero. These lines have a total mileage of 10 miles.

In addition to the lines actually constructed and open for traffic, another section, namely, that forming the northern half of the circular railway, about 6·5 miles in length, is now under construction.

The estimated cost of the works to be executed by the Municipality is 3,000,000 francs per kilometre, and of those to be carried out by the contractor 800,000 francs per kilometre. The total cost of the entire scheme contemplated, inclusive of the lines about 8½ miles long not yet authorised, may be expected to reach 300,000,000 francs (12,000,000 £).

The authorised fares are 25 centimes (2½ d.) first class and 15 centimes (1½ d.) second class for any distance. Second-class tickets, available for the rest of the day, are issued at 10 centimes (2d.) up to 9 A.M. The receipts are the property of the working company, but they have to pay to the Municipality a royalty on each first-class ticket of 10 centimes and on each second-class ticket of 5 centimes (½ d.).

The work on the lines already open for traffic was commenced towards the end of 1898, and was completed in fifteen months. The chief difficulties encountered were due to the necessity for removing and reconstructing the main drains and water pipes, &c., along the route of the railway, owing to the small depth at which the tunnels were made. For instance, the main sewer in the Rue de Rivoli had to be completely displaced and two new sewers, one on each side of the old one, substituted for it. No comprehensive system of subways containing all drains, pipes for gas and water, and wires, seems ever to have been undertaken.

The tunnels were constructed as near the surface of the ground as possible, but the depth varies according to circumstances. As a general rule the top of the arch is about 3 feet

6 inches below the surface of the street, but where the line passes below the main sewers of the Boulevard de Sebastopol, and of the Boulevard d'Asnières, or where one line crosses another, the depth is very much greater. On the other hand, the railway emerges into the open near the Place de la Bastille, and crosses the canal Saint-Martin by means of a bridge.

The whole of the tunnelling, except at some of the stations, is arched, the side walls, arches and invert being built of rubble masonry. The width of the tunnel for a single line is 12 feet 9½ inches, and for a double line 21 feet 8 inches, at rail level; the height of the arch above rail level is 13 feet 2½ inches for single line, and 14 feet 9½ inches for double line, the arches in all cases being elliptical. Refuges are provided in the tunnel at 82 feet intervals on alternate sides. The underside of the arch is finished with a coat of Vassy cement, ¾-inch thick, and the walls and invert with Portland cement.

The stations are mostly in arched tunnels, having a clear width at springing of 46 feet 6 inches, and a height above rail level of 16 feet 5 inches. The station platforms are 246 feet long, sufficient to accommodate trains of eight coaches. Arched stations are invariably adopted where the line is below the water-bearing strata of the subsoil.

The girder-covered stations have side walls of masonry which support the main transverse girders, upon which rest longitudinal girders, with jack arches between them. In these cases the roof of the tunnel forms the floor of the street.

All the tunnels are whitewashed inside and the stations are lined with glazed white tiles, and, as the tunnels are lighted throughout by electric incandescent lamps, the effect is remarkably bright and clean.

An attempt was made to use shields for the purpose of driving the tunnels under the streets without disturbing the surface. The result was not satisfactory; several serious subsidences occurred, causing considerable inconvenience to the street traffic. In some parts of the work, therefore, the use of shields had to be abandoned, and the method of "cut and cover" adopted instead. In the Rue de Rivoli it was not possible to employ a shield owing to the presence of the main sewer already alluded to, and here the open cutting system had of necessity to be employed, the street traffic being for a time entirely interrupted. In order to facilitate the removal of the excavated material, four galleries were driven from the tunnel to the bank of the Seine, where stagings were erected, enabling the "spoil" to be delivered into barges.

The permanent way consists of vignoles or flat-bottomed rails, 49 feet long, weighing 105 lbs. per yard, creosoted sleepers of beechwood and gravel ballast. Sole plates are used between the rails and sleepers, and the rails are secured to the sleepers by means of coach screws. The rail joints, which are supported on sleepers, are not opposite each other, and all rails are bonded for electrical purposes by four copper conductors. There are sixteen sleepers to each rail length.

The railway is worked by electricity on the (500 volt) continuous current system. The conductor rails are placed in the 6-foot way at a distance of 13 inches from the running rails, each conductor consisting of two double-headed rails weighing 78 lbs. per yard, supported on sleepers of extra length at intervals of 10 feet. The current is collected from the rails and conveyed to the motors by means of a shoe (*sabot frotteur*) attached to each motor carriage.

The trains are composed at present of four coaches, viz. one motor carriage (*automotrice*) and three trailing carriages (*voitures d'attelage*). All the carriages are four-wheeled and have centre buffers. The motor carriages differ from the rest in having a compartment at one end, and in some cases at both ends, for the driver or motor-man, and also in having a much stronger under frame, but the seating capacity is the same as in the trailers. The motor carriages have two motors of 100 horse-power each, one on each axle.

There are eighteen stations on the line between the Porte de Vincennes and the Porte Maillot, three on the Porte Dauphine branch, and four on the Trocadero branch—making twenty-five in all. But if the three stations at the Place de l'Etoile be counted as one, as in reality they are, the number of stations at present open is reduced to twenty-three. Of these all are arched except eight; seven are constructed with girder roofs, and one, viz. that at the Place de la Bastille, is in open cutting.

The excavation of the stations was the chief cause of obstruction of the streets, as the levels did not permit of tunnelling and the dimensions were too great to permit of the use of the shield.

As a general rule the stations have ordinary side platforms for the up and down trains, but some of the terminal stations and the double station at the Gare de Lyon have island platforms. The terminal stations are in two portions a few yards apart, each with its island platform, one for arrival and the other for departure. These are connected together by a single line loop, with a radius of 100 feet, which abolishes the need of cross-over roads and allows trains to start on their return journey without other operation than running round the loop.

To these stations the term "en raquette" has been applied. It may be mentioned that the trains on this railway travel on the right-hand track instead of the left-hand, as is usual on other lines.

Access to the stations is afforded by stairways leading from the streets to booking-halls, placed immediately below the surface, from which other stairs, and where necessary foot bridges, enable the passengers to reach the platforms. No change is given at the windows where tickets are issued, but the proprietors of the bookstalls are bound by their agreement to supply change to passengers free of charge. The entrances to the stations are situated in the side pavements of the streets, or else in the centre street refuges, and as a rule they are surmounted by a roof or kiosk of more or less ornate design. The stations are well lighted by incandescent electric lamps, about 13 feet apart, and occasionally arc lamps are provided in addition.

The signalling of the line is automatic. Each station is provided with an entering signal (or, as it is called in England, a home signal) and a starting signal, and when the distance between two stations renders it desirable, an additional signal is fixed half-way between them. A separate electric circuit is provided for the signals, which are actuated by means of treadles placed alongside of the rails, the arrangement being such that two signals must be at danger behind each train, or, in other words, there must always be an empty block section between any two trains.

The lines are open from 5.30 A.M. till 1 A.M. Between 5.30 A.M. and 8.30 P.M. the trains succeed each other every three minutes on the main line and every six minutes on the branches. Between 8.30 P.M. and 1 A.M. the intervals between trains become six minutes on the main lines and twelve minutes on the branches. The trains consist of four coaches each capable of carrying fifty passengers, or 200 per train. At three minutes' intervals there are twenty trains in the hour, equal to a carrying capacity of 4,000 passengers in each direction. At certain hours of the day this accommodation is found to be insufficient, and it is proposed to increase it by doubling the length of the trains, which will then consist of eight vehicles, the two first of which will be motor carriages.

The distance from the Porte de Vincennes to the Porte Maillot is 6.6 miles, and the time allowed for the journey is 30 minutes, which gives an average speed of about 13 miles an hour, while the maximum speed does not exceed as a rule 18½ miles an hour. These speeds may seem low, but they are due to the fact that there are 18 stations on the route, each of which, allowing for slowing down, stopping and starting, entails a loss of time of about half a minute, so that the actual running time available is only 21 minutes instead of 30. On the other hand, the stations being so near together, there is not time to permit of the speed being accelerated beyond the maximum mentioned above.

The Metropolitan, as it exists at present, has several features in common with the Central London Railway. The distance from the Porte de Vincennes to the Porte Maillot is 6.6 miles; that from Shepherd's Bush to the Bank 5.77. Both lines follow the direction of one of the main arteries of traffic in their respective cities; they were both opened in the same month, July 1900, the French line on the 19th and the English line on the 30th; they are both railways, as distinguished from tramways; both are underground, and both are worked by electrical power on the continuous current (500 volt) system. The intervals between trains on the Metropolitan (main line) are 3 minutes during the day and 6 minutes at night; on the Central London they are 2 minutes 37 seconds during the busy hours in the morning and evening, 3 minutes to 3½ minutes during the rest of the day and 6 minutes at night. Both lines are open daily for about 20 hours.

The principal difference between the two is in the depth below the surface at which they are respectively constructed, the Metropolitan being as close to the surface as possible, while the Central London is from 80 to 100 feet below the level of the street. They differ also in some other respects. The Metropolitan is in masonry tunnel, the Central London is in iron tube; the former has both up and down lines side by side in the same tunnel, the latter has each track in a separate tube; the tunnels of the former are lighted throughout, the tubes of the latter are without light except at the stations; the former has carriages of two classes, the latter of one class only; access to the stations in Paris is afforded by short flights of stairs, whereas on the London line it is necessary to employ lifts of large dimensions and costly construction to convey passengers to and from the platforms, whereby the working expenses are largely increased.

Other instances of railways or tramways laid in shallow tunnels or subways below the streets of large cities besides the Metropolitan of Paris are:—(1) The extension of the Orleans Railway in Paris from its former terminus at the Austerlitz station to the new station on the Quai d'Orsay; (2) the Inner Circle Railway of London; (3) the railway along the Boulevard Andrassy in Buda Pesth; (4) the tramways below the Common

and Tremont Street in Boston, U.S.A.; and (5) the railways now being constructed in New York.

The extension of the Orleans railway from the former terminus at the Austerlitz station to the grand new station on the Quai d'Orsay is a very fine piece of work. As it is intended to accommodate main line trains only, it does not facilitate local or urban traffic, and serves a different purpose from the Metropolitan, but it may be of interest if I make a brief reference to it here. It is almost entirely in tunnel, the depth of which below the surface is small, and was only authorized on condition that no steam locomotive should enter the tunnel even during construction. A system of electric traction has therefore been installed between the old and new stations on the continuous current (500 volt) system.

The new station at the Quai d'Orsay is unique, every effort having been made to render it artistically worthy of Paris. It is built of white stone, and is of fine proportions and richly decorated both outside and in. The arrangements for transferring the passengers and their luggage from the street level to the trains which are in the tunnel, and *vice versa*, are admirable, and might be studied with advantage by railway companies in other countries. In the matter of railway station Paris has set an example to the world.

In general construction the underground portions of the Metropolitan and District railways of London are not unlike the Metropolitan of Paris, and when the former have been remodelled and equipped for electrical traction, it may be hoped that the resemblance will be much closer.

The Buda-Pesth railway is only 2.2 miles long, and lies below that fine thoroughfare, the Boulevard Andrassy, along which no surface tramway has been allowed to be laid. It is as close to the street surface as possible, the rails being on an average 9 inches below it. The line is double, and there are ten stations on it. It has no connection at present with any of the surface tramways or railways. The working arrangements are very similar to those of the Paris line, but the electric conductor is placed overhead instead of on the level of the rails.

The underground facilities for communication which already exist in Boston, U.S.A., and which are being provided in New York, have been recently reported on by the tramways manager and electrical engineer of the London County Council. The Boston subway is intended for tramway traffic only, and connects with the surface tramways, differing in this respect from the Metropolitan of Paris, and from all the other undertakings referred to in this report. It must, however, be admitted that the difference between these underground railways and tramways is somewhat slight.

The New York scheme is for a railway, but as it provides for four tracks—two for local and two for express trains—it is altogether on a larger scale than the undertakings in either Paris, Buda-Pesth or Boston. The officers of the London County Council regard this as an "ideal form of transit," but no part of it is yet completed.

The subways or tunnels in the three last-named cities—Buda-Pesth, Boston and New York—have one feature in common; they are all rectangular in section, and are constructed of steel girders and columns combined with concrete. In this they differ from the tunnels of the Metropolitan in Paris and of the Metropolitan and District railways in London, which are arched.

It cannot, I think, be doubted that as regards the convenience of passengers and economy of working the balance of advantage lies with the shallow tunnel or subway as compared with the deep-level tube. It is easier of access, affords greater opportunities for escape in case of a breakdown or accident and possesses a purer atmosphere. But the difficulties of constructing such subways along the principal streets in London are formidable. Apart from the unavoidable interference with the surface of the streets, and consequent dislocation of traffic which would cause much inconvenience and dissatisfaction, there remains the still greater difficulty, due to the presence a few feet below the surface of a network of sewers, drains, water pipes, gas pipes, electric-light cables, telegraph and telephone conduits, &c., to which must, in many places, be added vaults and cellars extending under the roadway. All these would have to be diverted and reconstructed, or heavy compensation paid for their abolition. The problem is further complicated in London by the narrowness of the thoroughfares.

Some experience of these difficulties has been gained in the past during the construction of the Inner Circle Railway and more recently during that of the Whitechapel and Bow extension to which allusion was made by the chairman of the Metropolitan District Railway in his address to the shareholders last month.

Where, however, new thoroughfares are in process of formation, the obstacles to shallow subways are not so serious, and advantage may well be taken of the opportunities so offered to build subways for tramway or railway purposes (perhaps even for ordinary vehicular traffic), in the manner proposed by the London County Council along the new street now being made from the Strand to Holborn.

## THE ROMAN FORUM.

THE Rome correspondent of the *Times* writes:—

Signor Boni, director of excavations in the Roman Forum, has made another discovery of unusual interest. It has long been his conviction that the subsoil of a part of the Forum contains the necropolis of the founders of Rome, and he has given the Aryan origin of those founders, the character of the tombs must be in accordance with the Aryan custom of cremation. Critics have displayed much scepticism concerning the theory, as also concerning the traces of Aryan development which Signor Boni has detected in the Forum; but he has once more silenced their objections by producing the object of their existence they had doubted or denied. Last evening he discovered a prehistoric tomb, believed to date approximately the eighth century B.C., containing a large urn, or dolium, the neck of which was full of calcined bones, and several reticulated shaped vases, besides a bowl and a cup with horned handles like those found in the terremare of the Bronze Age. The tomb is situated in the bed-clay some 12 feet below the level of the Sacred Way, opposite the Regia, and close by the temple of Antoninus and Faustina.

In some respects this discovery is the most important yet made in the Forum. One tomb is not a necropolis, but it is unimpeachable evidence of the existence of others. Unless the Government should, to its shame, restrict the funds necessary for the exploration of the lower strata of the Forum, the question will soon be settled. Meanwhile it is to be noted that the reticulated vases of the tomb bear a striking resemblance to the decorated gourd, and that the covering of the funeral urn is a faithful reproduction of a conical hut roof—signs that they date from a primitive period. The tomb may be regarded as the missing link in the further end of the chain of Roman history, as reflected in the Forum and illustrated by Signor Boni in the discoveries of the *cippus* under the Black Stone, the Rostra, the ritual pits, the massive Republican drains (beside which the Cloaca Maxima seems insignificant), the extraordinary underground gallery for scene-shifting, the Lacus and the Fons Aemilia, the Sacred Way, the Heroon of Cæsar, the Regia, the temple of the Vestals, the Basilica Aemilia, and the church of Santa Maria Antiqua—to enumerate only the more important and astonishing results. How vast is the culture and how immense the work required to excavate a site which, within a few acres, contains monuments extending from prehistoric times to the eighth century A.D., can be appreciated only by those who have watched week by week and month by month the progress of the excavations; and people who complain that united Italy has done little for Rome should reflect upon the achievements of a Venetian (who deserves, if ever man deserved, the title of *Civis Romanus*), under the auspices of the Italian State, on a site where, though it was one of the chief centres of civilisation, the Popes were content that cows should graze.

## STRUCTURAL COLOUR DECORATION OF THE INTERIOR OF PUBLIC BUILDINGS.\*

(Concluded from last week.)

MAY be blamed for not referring with greater fulness to the painted wall surfaces and roofs, of which there are many, in modern churches. This work is raising itself above mere commercial expression, and under the direction, and with the cooperation of the architects of these buildings, we have witnessed by many painters of ability and knowledge.

If there is one thing which may strike us in this modern work as being different and inferior to the best work of the old time, it is a very general want of use of the full brush of colour, and instead of being laid through the work with bold and masterly sweep, and binding thereby, in the necessary repetition of a pattern, the banal and accurate repeat so constantly seen in modern work, and never to be found in the old.

What makes so much ecclesiastical decoration of the present day so devoid of interest is just this absence of intelligent handling. We are better without colour if it is not used in a manner consonant with its dignity. We may be sure that even on our wall will be ample if we use it in any other way, such as in the lowest border or diaper as in the picture they surround.

In our theatres and places of public entertainment the same want of expression is, alas! not being made. The desire of the modern theatre manager to build a theatre, and to open it in six months, against the production of anything else than a place in which plays may be produced. We are far behind the French in this respect. In Paris the foyers and staircases of the principal theatres are notably decorated by artists, so that the audience has the privilege of knowing that it is not in a mere box of mystery, but in a temple devoted to the arts. I am inclined

to think that were our theatres of the latter kind the interest of the audience in the art of the drama would be quickened and encouraged.

And now as to the principal methods in use by painters at the present time. Probably the world has never seen a more beautiful method of painting than buon or true fresco, but, alas! its use has not been fully justified in this country. The Royal Commission I have just referred to took a good deal of evidence as to its suitability for the decoration of the Houses of Parliament. A number of painters of eminence spoke against its being attempted. They advocated the use of oil-colour. But the Commissioners, perhaps dazzled by what were then considered the triumphs of modern art—the frescoes at Munich—decided that the new paintings should be in that method.

Dyce, Cope, my father and one or two others were successively commissioned. Exposed, however, to the bad air of their surroundings, these works have in some cases suffered beyond repair. So doubtful were the painters themselves as to the suitability of the scheme that when Maclise was commissioned to paint the walls of the painted chamber he, with the sanction of the Commissioners, proceeded to Germany in order to make researches into the practice of stereochrome or water-glass painting. The result was that he adopted the process in the large wall-painting, "The Meeting of Wellington and Blücher after the Battle of Waterloo;" it was also adopted by Mr. Herbert, who was then engaged on other wall surfaces in the palace.

You will permit me to remind you of what happens in buon fresco. The powder colours mixed with lime water are applied to the last and freshly-spread coat of plaster before it has had time to absorb more than a trace of carbonic acid from the air. The painting ground is in fact saturated with an aqueous solution of hydrate of lime, that is, slaked lime, while there remains a large reserve of this compound in an undissolved condition. When on such a surface a layer of pigment mixed with water is placed, as that water evaporates the lime water in the ground diffuses into the paint, soaks it through and through, and gradually takes up carbonic acid from the air, thus producing carbonate of lime which is the actual binding material.\* The whole painting gains in this chemical action, appearing to absorb light and to reflect it from the sand facets of the ground to the spectator.

But, unfortunately, and here I again quote from Professor Church's interesting book, "The Chemistry of Paints and Painting," "the protection afforded to the pigments by the binding material, this carbonate of lime, is not generally very efficient. In the case of a dry wall, free from soluble saline matter, and exposed to a pure atmosphere, it may remain good for centuries. But in air contaminated with the products of the combustion of coal and gas, and with tarry and sooty impurities, a fresco picture soon perishes. The binding carbonate of lime is converted into the sulphate, breaking up the paint. The same causes will form sulphate of magnesia from the carbonate of magnesia in the plaster, and the paint will scale off."

In our large towns therefore to-day, buon fresco has no chance of lasting.
